AGAINST the erection of monster buildings the new Building Act for London has provided certain restrictions as regards height, though it will still be possible for one owner to overtop his neighbour by the erection of additional stories, which may be so formidable as to obstruct the rays of the sun, as well as seriously sacrifice the scale of the adjoining premises. We are at present by no means anxious to emulate our brethren in New York, Chicago, and other Western cities of the New World, in the erection of huge skeleton buildings of steel; but are contented to build substantially, with a fair appearance of uniformity and proportion, believing, as we do, that extremes in height and dimensions are calculated to destroy the dignity of our city buildings, and to bring discredit on architecture. A colossal building immediately destroys the size of those in its proximity by setting up a standard of scale disproportionate to everything around it. By its dwarfing effect on adjoining buildings the whole surroundings are made ridiculous, for the eye immediately seizes upon any disparity in size, such as between window openings, doors, and other features, and the diminutive features suffer in contrast with the larger. They appear to belong to a race of Lilliputians, and an almost comic element is introduced. The comparison becomes odious. Some idea of this contrast may be observed when viewing the large buildings and hotels lately erected facing the Embankment from Salisbury-street in the Strand. The overpowering size of the new hotel which backs on the Strand dwarfs almost to insignificance the old houses. One sees the same disparity of proportions in Whitehall when looking at the backs of the large buildings in the rear of the old Banqueting House. Similar incongruities may be seen behind Northumberland-avenue, in the neighbourhood of the Victoria Embankment, in parts of Clerkenwell, where huge blocks of flats have been erected. With the growth of the population of the Metropolis, and the consequent augmentation in the value of building sites, it is natural to expect an increase in size in our public and commercial buildings; it would be absurd not to expect our premises to become larger and higher in reason. What we object to is a height disproportioned to the site and its surroundings, the pulling down of one or more houses of the ordinary size and erecting in their place a huge structure of double and treble the height. We are afraid the craze for "monster" buildings has set in, simply because it is a little sensational, and to keep in countenance our cousins across the Atlantic. Magnitude is not, *per se*, an architectural virtue, although it gives importance to otherwise inferior works. The size of a building impresses the eye, but it is still only one of those technical qualities of architecture which are called "sensuous." The magnitude of an engineering structure such as the Forth Bridge impresses the beholder, though it may be exceedingly ungainly; but we have never yet seen a street building twice the height of the adjoining houses which is not extremely ugly, however well designed the façade may be. Why? Because its bare flank sides or party-walls and roof entirely destroy all congruity. The structure looks like a huge block interposed between the adjacent houses, shocking to all sense of fitness and unison. The very suddenness and abruptness of the break produces a painful effect on the nerves, which is not found in the great bridge or viaduct. In New York the architect of the "tall building" has in a few notable erections — such as the Merchants' Exchange, National Bank, the American Surety Co.'s, the "World" Building, the Manhattan Life Insurance—tried, by producing tower-like masses, to overcome this appearance; but, as a rule, they are monstrously misshapen and forbidding. There is nothing in Nature that can be found analogous to it, for we never find any sudden or abrupt break, and the Alpine heights and peaks are picturesque in their broken grandeur of outline. The only conceivable way of making such a mass tolerable is to pyramidalise it—to give it a gradually tapering and tower-like outline; but this would be impracticable where the party-wall division as laid down by our Act is exacted. The typical street monster is the acme of deformity, because its lines are so uncompromising; but we have other instances of jarring on the eye equally detrimental. The extension of King's College abutting against Somerset House is a notable example of one building injuring another, and Mr. Penrose did good service in calling attention in his address the other day to the importance of guarding our old buildings and monuments from this source of injury. He referred also to the way the west front of Exeter Cathedral has been dwarfed in effect by the re-erection of an old church, the tower and spire of which is so high as to injure the scale of the cathedral. The older and smaller church on the site gave "valuable scale" to the west front. We may see this injury or insult to old and meritorious buildings going on everywhere, and without any remonstrance from the authorities. Has not St. Paul's Cathedral itself suffered by the erection of the tall block of shops on the south side of Ludgate Hill, and which abruptly terminate on the spot occupied by the well-known tea warehouse? And a dozen other instances may be mentioned where an old and monumental building has been spoiled by the erection of a new building of greater height or size in its immediate vicinity.

The new London Building Act might have done more to safeguard our streets and public buildings. It is true it contains some useful provisions for checking the erection of "sky signs" and preventing the disfiguring of our streets, but the still more palpable nuisance of monster erections and hoardings has hitherto been allowed to exceed the limits of toleration, till nearly every street in which rebuilding is going on is disfigured by monster temporary erections, and, when these are removed, by buildings which have been designed without any kind of sympathy with those which are next to them, flanked by party-walls which rise in defiant impudence over the roofs of other premises, blocking out light and air, and destroying all that there was of graceful skyline or picturesque profile in the older street.

ARCHITECTURAL ASSOCIATION.

THE second ordinary meeting of the Association for the present session was held on Friday evening, the President, Mr. E. W. Mountford, F.R.I.B.A., in the chair. Messrs. R. Morphew and H. Budden were elected as members. Several donations to the library were announced, including the *Transactions* of the London and Middlesex Archæological Society, and the Collections of the Surrey Archæological Society, and other books, presented by Mr. E. Woodthorpe, M.A., and a bound volume of photographs from Wells and Ely, given by Mr. E. Fleetwood.

THE A.A. AND THE EDUCATION OF WORKMEN.

Mr. F. T. W. Goldsmith, hon. secretary, read the report of the general committee on the resolution passed by the Association on the 19th January last on the Education of Workmen. This resolution, it may be remembered, referred it to the committee to inquire if, and in what manner, the Association can usefully exert its influence towards the organisation of a more thorough system of education than at present exists for artisans engaged in the London Building trades, and its future supervision by architects. The committee now report that, "We are satisfied that there are many questions connected with the education of artisans in the London Building Trades which are of very considerable importance to the future well-being of architecture, and which are needing careful examination. The best course seems to us to be for the Association to invite a conference to meet at an early date to discuss these questions. We have consulted the following bodies, and have been informed that they will gladly appoint representatives to attend such a conference:—Architects: The Royal Institute of British Architects, the Architectural Association, the Art Workers' Guild, and independent London architects. Master Builders: The Institute of Builders and the Master Builders' Association. Workmen: The Building Trade Federation, the Operative Builders' Society, the Amalgamated Society of Carpenters and Joiners, the National Association of Operative Plasterers, the United Operative Plumbers' Association, and the Operative Stonemasons' Society. City Companies: The Carpenters', Plumbers', and Bricklayers' Companies. Educational Bodies: The Technical Education Board and the London School Board. Polytechnics: City and Guilds Technical Institute, Regent-street Polytechnic, Battersea Polytechnic, Borough Polytechnic, Goldsmiths' Institute, New Cross, and the People's Palace, Mile End. We recommend that we be authorised to invite a conference of representative bodies to meet at an early date to discuss the education of artisans engaged in the London Building Trades, and to take such steps as we considered desirable in the matter." This report was signed by E. W. Mountford, as president, and F. T. W. Goldsmith and B. F. Fletcher, as hon. secretaries.

Mr. Owen Fleming moved without comment the adoption of this report. This was as concisely seconded by Mr. John Begg, and carried unanimously.

THE STUDY OF MODERN ARCHITECTURE.

Mr. A. Beresford Pite read a paper on this topic. He pointed out that the study of architecture had hitherto consisted in the review of the works of antiquity, all the resources of which had been laid under contribution to our knowledge of what we had mistakenly called the "styles." Attracted in the first place by beauty of forms and detail, then by the interest of history and developments, architectural students had glowed with enthusiasm over Greek, Egyptian, Roman, and almost every "style" as it became available for observation. A somewhat wider range of view more recently had led to a consideration of the methods and motives of ancient design and construction, and enthusiasm had grown into wonder as the science displayed by Greeks or Goths had been discovered where little else than native genius was suspected to have been at work. None of this enthusiastic study had really been wasted; its fuel had supplied a warmth and touch of imaginative colour that had been invaluable to all our conceptions of the past in art and literature, and had been especially manifest in the work of the historians, but the result upon current modern architecture had been the occasion and cause of melancholy and discontent. The lecturer admitted that it would be a hopeless and thankless task to set before architectural students the foolishness of this enthusiasm, and the unwisdom of a thorough concentration of energy upon the mastery of the secrets of the success of ancient work. He urged, however, that an enthusiasm for varied phases of the architecture of antiquity could not be any longer beneficial to the modern architect, and, further, that without some equally potent force as living and instinct as the ardour of the past, the modern architect, and with him modern architecture, was in a pitiable condition. We were not altogether without sources of information as to the effect on architectural art of different conditions than those which had operated upon ourselves. In company with Belgium, Austria, Italy, and Germany, France had pursued a regular academical development of the traditional architecture of the immediate past, and with patient studiousness the "European style" of the 19th century had been developed. No warmth of feeling had been evolved in its generation, and consequently until the hands of Time, with his handmaid History, intervened, no warmth of enthusiasm could be excited within us towards modern Continental architecture. He contended further that we ought not to mistake professional equipment and qualification for architectural efficiency and power. There was some considerable danger of this at present among ourselves, for we were all conscious of the slackening interest in old work and its study, as the failure of competitions for medals and prizes offered for measured drawings testified, and it was to be feared that the progressing pressure of examinations was already impinging upon the tender growth of that enthusiasm which architectural educators seemed strangely incapable of assisting. Speculation as to the future was almost as unprofitable as lament over the past, but the suggestiveness of the idea that architectural students two centuries hence would be like ourselves, enthusiasts as to the works of our own ancestors, might have something to teach us. Why should we not apply our own treatment of the past to our present? Why not be as enthusiastic about the work of the 19th as about that of the 17th century? Why not sketch it, study it, measure it? It might be every bit as good, and much better. All that went for the making of good architecture had been much more abundant in our era than in the past, and, perhaps, if we gave up looking at distant objects with telescopes and looked naturally at what was around us, we should find as much to interest and delight our eyes. Surely the future historian would feel an enthusiasm for the 19th century that would be shared alike by the man of science and the artist and man of letters. Why should the architect stand aside and be unmoved? Within the limits of a century, had we not erected a series of buildings the æsthetic qualities of which were varied and beautiful in a very high degree, and more so than those achieved by any other race, the wide world over, in a similar span of years? In construction, in scientific equipment, and in æsthetics, surely the architecture of the 19th century would be to our successors as worthy of enthusiastic admiration as any of its predecessors that now excited our envy. While he would say study and enjoy ancient art as much as ever, let them also study and enjoy modern architecture. Let them derive enthusiasm from the wonderfulness of modern life and invention, and display their delight in it in their architecture, by their frank acceptance of the position, by their heartiest endeavours to make the best use of the materials, inventions, and science of the time, and let their trained and instinctive sense of beauty express in proportions, compositions, features, and decorations that they were not guided by a blind subservience to archæological ideals, but rejoiced in living in an age of privilege and advantage, with all the knowledge of the past ready to hand, and the products of commerce and science at disposal. It had been the use of advantages and qualities such as those that had made all characteristic architecture in the past, and that could not fail to do the same for us. Nothing could be evolved out of nothing, and he was far from suggesting that the architect should lay all his present material of design aside and figuratively make bricks without straw. All this material, however, did not lay, as the Royal Institute of British Architects' examination scheme in its art section syllabus seemed to imply, in a knowledge of the forms and features of ancient architecture. The beauty of ancient buildings could not be transferred by imitation to modern ones, for the student might measure and photograph, and reproduce in actual building, and find that he had only a stupid copy, without life or interest. As this had been a century of revivals, examination of some of its typical buildings could not but be instructive. Let them try to discriminate between the beauty that was merely borrowed from antiquity, and the living elements of architectural art that composed it. Let them ascertain how much was interesting and attractive merely because reminiscent to the student of bygone art, and how much was beautiful because expressive of the architect's delight in his problem and its elucidation, and manifested his appreciation of justice in proportion of ornamentation and form. Analytical study of this kind was essential to a proper grasp of the architecture of any period, though the dry-as-dust pundits of the day were not awake to it. In the Parthenon, for instance, the secret of its beauty was not in the subtle mathematical ratios that underlay its design, not in the forms of its detail, not in the unrivalled dignity of its Acropolis site, as surely it was not in its antiquity, for it must have been more truly and perfectly beautiful when first built than now in its ruin. Its charm was independent of archæological descent or antique traditions, and lay in a manifested power to support and carry, to shelter and shade, and to endure with firmness. The mind without effort was assured that the first necessities of all building were satisfied. But this conscious power was secured and expressed with every evidence of perfect finish and completeness; everything had been accomplished with art as well as with power; the columns were perfectly shaped for their load, and were decorated to emphasise the direction of their expression; they were shaped to completely satisfy the eye as to stability, and their abaci crowned them only to receive the load aright. Their bulk was regulated by the superincumbent load, weighed with regard to the possible length of connecting beam, and adjusted to satisfy the eye as to the due proportion of void and solid. The ample entablature was the essential element of the design, affording shelter and binding with simple horizontal masses and lines the supporting columns into covered and shady colonnades, and in carrying the roof made it a building. The entablature was emphasised and decorated with sufficient beautiful forms in the metopes, the undecorated triglyphs with their vertical flutings sufficing to convey the expression of the downward bearing of the roof upon the columns. The cella walls were equally expressive of the required inclosure, without unnecessary architecture, yet magnificently decorated with the unbroken line of frieze. In all, the simplest lines and the most direct expression governed the whole, permitting in the decoration the required element of freedom and play of lines to afford balance and contrast to the eye. Everyone of these elements and methods could, Mr. Pite argued, be transmitted into architecture, but one might have a reproduction not only of the forms and details, but of the exact proportions and size of the original, and yet miss its mysterious and complete beauty. The Walhalla, near Ratisbon, built by Klenze as a Bavarian temple of fame, was a complete archæological effort to produce the Parthenon, yet the whole was uninteresting except as a failure, and miserably unimpressive as architecture. Yet Klenze could do very satisfactory modern work himself when less trammelled with archæology, as in the new Pinnacotek at Munich. The lecturer proceeded to apply an analytical examination to St. Pancras's Church in the Euston-road, designed by Inwood, as a modern building of the revived Greek "style." St. Pancras was a building that suggested in every form and detail enthusiastic archæological study. The antiquarian thoroughness of the design was most remarkable, and was perhaps of a sounder type than that of Klenze's Walhalla. The prototype in the Temple of Minerva Polias was on the Acropolis at Athens—how different the result could scarcely be described. The original seemed to be a very offering to the Graces of architecture; a refined and delicate elegance of proportion, a sense of style in its true meaning, of virile beauty and quiet power characterised it, which lost nothing by its position upon the platform of the Parthenon. The portico of St. Pancras was just double the size of that of the Temple of Minerva Polias, and though the utmost care had been bestowed upon the detail of the order, its charm had not been grasped. The portico and order of St. Pancras, however, failed for other reasons than want of charm in proportion. There was no simple and easily-perceived motive prompting its existence of design. It was but a sort of antependium to the steeple composition. Apart from being nakedly uninteresting, the proportions of the composition of the western front were satisfactory, and would preserve for the building and its architect more esteem than the effort to be Greek. The eastern end of the church was necessarily more original and consequently satisfactory, the apse and transept-like vestries having some scale, grouping, and expression of their own. The interior, however, being less trammelled, was more satisfactory, and indeed its large and spacious effect of a fine hall with an impressive apse was to be preferred as more suitably modern than many Gothic interiors. What was true of works of the Greek revival was equally so of the Gothic, though the degree of interest might vary. The test might well be applied in the crudest way to the most recent and perfect examples of modern ecclesiastical architecture. Deprive a modern thorough Perpendicular church of its archæological robe, and of its studied interest in correctness of style and purity of period, and what was there left to indicate that the world had moved on since its primal age of Mediæval beauty and innocence, and that we were in the age of England's greatest prosperity and glory? What was indeed to indicate any life or movement, or that it was built in the 19th instead of the 15th century, except, perhaps, the existence in the building of a heating apparatus, a gas supply, and some limited sanitary arrangements? There were a large number of buildings, however, of the Gothic revival that had qualities well calculated to survive the ebbing of the tide of Mediævalism, buildings the interest and charm of which rested upon sure artistic grounds, and among these he would rank the Houses of Parliament, which possessed a beauty more lasting than a passing taste, and revealed the fact that the greater architectural qualities of majestic symmetry and grandeur of grouping were permanent and essential to success. The Mediævalism, indeed, was only skin deep, the corpus of the whole being of sound architecture. In the Law Courts, on the other hand, the marvellous Gothic life which invested every detail and feature might be chiselled away and the building would still be rampantly Gothic. Were they to re-clothe it with Classic or Renaissance detail, the vigour would still be powerful enough to assert its vitality and claim the building, so long as it had any articulation left, as the *ne plus ultra* of the Gothic revival. In conclusion, the lecturer said, do not fear to be modern, study and sketch every example that faces a modern requirement and subdues it artistically, and renders it beautiful without sacrificing aught upon the shrine of antiquity. A warehouse front, even if stipulated to be wholly of windows with only iron-girder construction besides and a few brick panels, can and should be made as beautiful and interesting a work as a half-timbered front. And have we not for such classes of buildings resources in new materials, that sensibly used would soon be recognised as artistic, such as glazed brickwork and terracotta, only when not used and designed as stonework? Why should concrete and cement building be left to the tender mercies of cheap speculative builders, when we have plenty of need to be taught the value of broad, unbroken surfaces in design, and long for economical methods for smaller country buildings, where the use of different textures in the finishings of a cemented or concrete wall will give plenty of variety and scope in new directions? Above all, learn to discriminate, practise upon yourself, examine and try to note down the impressions made upon you by a building, say, of known beauty, and then of one that you see for the first time. Why do you like one? Why are you doubtful about another? Not what features please you merely, but what qualities create the pleasant impression. Train yourself to like and dislike reasonably on good grounds, instead of unreasonably, like the amateurish and ignorant world.

At the conclusion of the paper a vote of thanks was passed to the author on the motion of Mr. W. D. Caröe, seconded by Mr. C. H. Brodie, and supported by Messrs. A. H. Hart, A. Bolton, and B. F. Fletcher.

THE SOCIETY OF ARCHITECTS.

THE first ordinary meeting for the eleventh session of the Society was held at St. James's Hall, Piccadilly, on Tuesday evening. Mr. Edwin Jas. Hamilton, of London and Brighton, in the chair. The following architects were elected as members:—F. G. Cundall, 70, Parade, Leamington Spa; F. Castle Gant, 11, Regent-street, Wrexham; W. C. Humphrey, R. E. Estab. Up Park Camp, Jamaica; John Henry James, 14, Romilly-crescent, Cardiff; Victor Mitchell, St. Peter's Chambers, Bournemouth; A. F. Wrightson, 26, Budge-row. E.C.

REPORT OF THE COUNCIL.

Mr. A. Montefiore, the secretary, read the annual report of the Council, who referred with satisfaction to its favourable nature. Out of a total of fifty-four, forty-one candidates who, by the works they have carried out, proved themselves in every case to be competent architects, have been elected during the past year to membership; two gentlemen have been added to the list of Associates, and one gentleman of distinction to the list of honorary members. Against this, one honorary member and two members have died, and seven members have retired, thus leaving a net total of 495 members upon the roll of the Society. The Council regretted that during the past year Mr. Edgar Farman, who had served the Society from its foundation with great zeal, discretion, and ability, and had in particular rendered signal service in carrying the incorporation of the Society into effect, had resigned his position as honorary secretary. A silver vase, together with an illuminated address, was presented to him by a large proportion of the members on his retirement from that office, and on the occasion of the presentation on December 12th, 1893, a very hearty vote of thanks for his valuable services was unanimously passed with acclamation. The Council at the same time expressed their satisfaction at having secured the active and able co-operation of Mr. Ellis Marsland in the honorary secretaryship.

During the session papers were read and addresses given by the president (Mr. George Highton) and Messrs. A. G. Hill, M.A., F.S.A., William Woodward, Ellis Marsland, the Rev. Canon G. F. Browne, D.C.L., F.S.A., J. Starkie Gardner, D. F. Ranking, M.A., LL.D., Major F. S. Leslie, R.E., and G. A. T. Middleton. During the past year the Council had met nineteen times, the Finance Committee eleven, the Literary Committee four times, and the Practice Committee on five occasions. At the various meetings, important questions affecting the society and the individual as well as the general interests of members had been repeatedly raised and settled, and the Council hoped that members would continue to avail themselves of the advice and experience offered them through the special standing committees. During the past year, by direction of the Council, the honorary secretary and secretary visited the members of the Society in different provincial centres, and the good arising from this had been so noticeable that it was proposed to continue and extend this periodical communication between the council and the members. It was further intended to organise, during the coming session, a series of meetings in the chief provincial centres, to discuss the question of "The Education and Registration of Architects." The Council had, during the year, carefully gone into the matter of examination for admission into the society, with the result that a report was prepared and submitted to the members at the recent annual general meeting. The Council drew attention to the fact that the *Journal* had been considerably improved, and they felt sure that the members would join them in thanking the editor for the change he had effected. Still further improvements were in contemplation, and the Council would urgently request the co-operation of members, particularly of those resident in the Provinces and the Colonies, in the supply of notes upon all matters which come under their observation, and which they think would be of interest to their fellow members.

Mr. Ellis Marsland moved the adoption of the report, which was seconded by Mr. H. G. Quartermain, and it was unanimously adopted. The balance-sheet was also presented and adopted. It showed a total revenue of £699 8s. 6d., a balance of £5 7s. 6d. being carried forward on this account, raising the surplus in hand from £232 2s. 6d. at the end of last year to £237 10s.

The President then delivered his

INAUGURAL ADDRESS.

Having acknowledged the honours conferred on him, the President continued: My aim will be, not only to maintain, but to raise by all legitimate means, the status of the Society, and also to increase the practical usefulness of its undertakings. In looking over the names of the men who have occupied this chair, to whose untiring energies and signal abilities the Society owes much, it is perhaps not a little significant that four out of the six have been architects engaged more or less in practice in the provinces. Now this fact emphasises a feature of the Society's work which it is, to my mind, of great importance to keep well to the front—namely, the extension of the benefits of the Society by all practical means to architects living at a distance from London. It will be fully granted that to architects practising in London, and to students residing here, there come many advantages of a social and educational kind to which men in the provinces — often much isolated from their professional *confrères*—are strangers, and to such the bond of union afforded by our Society cannot be made too real. The report which has just been issued by your Council mentions two useful extensions of our operations, both in the direction to which I have referred. The improved character which the *Journal* of the Society has, during the past year, assumed—both in literary excellence and style of production—is a matter for congratulation. The other matter is the visits of the hon. secretary and the secretary, by direction of the Council, to members in various provincial towns. Such friendly visits cannot fail to be of advantage, both to the members visited and to the Society. I sincerely trust, moreover, that it may be found practicable to carry out the contemplated holding of meetings in large provincial centres. To the members residing in these districts we must look to create the interest, and even enthusiasm, essential to the success of such gatherings; but if well organised and heartily taken up, such meetings would not only be helpful to our membership, but would doubtless do much to promote an education of the public mind on the important subject of the compulsory examination and registration of architects. At the close of the first year of our corporate life as a society, it is encouraging to be able to report a substantial increase in the membership. The total number of members and associates now exceeds 500. May I express the hope that with such an enlarged constituency the members attending our ordinary meetings may also be materially augmented? This would be both encouraging to those gentlemen who so freely give much time and pains to the preparation of papers, and also most helpful to the members themselves. Members must ere this be aware that the important question of examination for admission to the membership of our Society has, after careful consideration, now assumed definite shape. The scheme drafted by the council was submitted to the annual general meeting a fortnight since. It would have been surprising if such a radical change could have been brought about without difference of opinion. Variety of opinion, however, is not generally detrimental to a cause, but frequently leads to more careful consideration of every point, and thus secures in the end a better result. In my judgment it has been so in this case; but whatever be the opinions held and freely ventilated during the time for discussion, it is the evident duty of every member, and more especially of the Council and officers, now the matter is settled, to use every endeavour to carry the matter forward to a successful issue. In order to avoid misapprehension, it cannot be too distinctly stated that, in taking this action, the Society of Architects aims at no rivalry or competition with any other body. It is only following a course which is not unusual amongst other professional societies, and one, moreover, which is in perfect consistence with its steady promotion of the scheme for universal examination and registration of all architects. The only object sought is one which must commend itself to an unprejudiced judgment—namely, the guarding of the Society against incompetency, and securing that everyone elected to membership shall have a reasonable claim to be called an architect. The effect which the new rule may have upon the numerical growth of the Society, it would be difficult to foretell; but even should it check the increase, it must add to our self-respect, and will doubtless also raise the Society in public estimation. The provisions for a students' section have my very warm approbation, and I sincerely trust that the advantages presented will be largely embraced by pupils and others. I referred at the outset to the steady growth in the position and influence of our Society. The extension of our membership into the Colonies and other countries, the publicity afforded through the Press, the promotion of the Bill for the compulsory Registration of Architects, and, lastly, the incorporation of the Society have all doubtless contributed in varying measure to this growth. But let us never lose sight of the fact that real success and advancement, both for the Society and for the profession at large, depends upon ourselves. Upon what we are as men, and the works we achieve as architects, more than upon any external or accidental circumstance, will depend the position we realise for ourselves, and indirectly the success and status of our society. With this thought as a thesis, I venture to draw your attention briefly to a few considerations affecting the practice and province of the architect. Foremost amongst the essential elements of architectural practice I would place what I may describe as an artistic sense—the faculty of recognising and enjoying the beautiful in all things. And, more than this, an open vision to see, and wisdom to understand, the great underlying principles out of which all true beauty, whether in nature or art, grows. The direction of the student's work will depend much upon his tastes; but a study of the best examples in Classic, Gothic, and Renaissance architecture is certainly desirable. The aim of such studies should be fundamental, not with the object of slavishly copying, but of learning the principles upon which the builders wrought; and thus it will often be found that some of the principles are the same in widely differing styles. We are often twitted in this country with having no national style, but—as the Americans say of our weather—possessing "samples only." I take it we must admit the criticism. But may not this fact be due in some measure to the ofttimes wrong direction of our studies? It is scarcely a generation back since it was a common practice to regard ancient Classic examples as objects to be copied bodily—at least, as to elevation. The interior purpose of the new building might even be wholly different from those of the original, but convenience of plan had to succumb to an imposing façade. The Gothic revival only in a measure mended matters, for a time, for a somewhat slavish copying of detail, apart from a proper understanding of principles, became the fashion. This period, through which we have now happily passed, has doubtless had its uses, nor can we yet afford to set aside a careful study of Ancient and Mediæval art. It were indeed far better to copy bodily a good design than to invent a bad new one. But the evil is that buildings, like plants, are often indigenous to the soil, and ill-adapted for transplanting to another clime. Though the maxim is not a new one, we have perhaps not yet come fully to understand how a national style can scarcely exist, at least can only be good, as it grows out of, and fitly expresses national habits and characteristics. But when we speak of the "practice" of the architect, the word itself suggests that something more that the possession and efficient training of the artistic sense goes to the making of an architect. He must also undoubtedly possess not a little practical knowledge of several sciences. To the vexed question, whether an architect should be an artist or a theoretical mechanic, I would reply: In a measure he must be both, and a man of business too. An artist may be a thoroughly unpractical man, no man of business, and yet be a good artist; an architect cannot. On the other hand, neither has the mere mechanic, or man of business, with perhaps little art sense, and no art training, any claim to call himself an architect. He may be well versed in the science of building, and able, most efficiently, to conduct the business of his client, but he cannot be a true architect unless he be a true artist. Lacking this, though his buildings be very ornamental, the ornamentation will probably be vicious, and though his work secure many admirers, it will inevitably be devoid of the elements of true beauty, and transgress at every point canons of good taste. Time will only permit of a brief mention of two features of the times which present special hindrances to architectural practice. The mania for cheapness thwarts us at every point, often curtailing expenditure below reasonable limits, and tempting to the improper use of materials made to imitate the functions of more costly substances. The multiplication of specialists' manufactures by way of fittings and decorative features, though it sometimes saves us trouble, tends to sameness of treatment and loss of originality, and often unhappily to the fostering of a vitiated taste for showiness and a wholesale destruction of true art. The qualifications for the practice of architecture are wide in their range, and certainly such as to make large demands upon the powers of most men. I think, however, you will be ready to admit that they are not unreasonable. But does not every consideration of the subject point again to the absolute need for a careful education and training for every architect? Let us now turn from the qualifications for the practice of architecture and inquire what are its limitations. What is the province of an architect? One thing must be evident. Unless he become a specialist the variety of the buildings which an architect may be called upon to design will of itself present a wide scope for the exercise of his talents. He may be to-day designing a church, and to-morrow a dwelling-house, school, or factory. He need not, it is true, have a previous knowledge of all the technical requirements for which such buildings, for instance, as factories are needed; but he must be able readily to grasp these requirements, to invent methods for overcoming difficulties, to guide and advise clients who often scarcely know their own needs, and to throw all into forms of beauty framed out of suitable and enduring materials. Such duties are not light, and surely a man with any amount of practice might find in their faithful exercise ample scope for time and genius. But what are the facts of the case, gentlemen? A study of local Directories would lead us to suppose that many architects must indeed be men of Herculean powers. In fact, architecture seems to have been tacked on as a light and pleasant pastime relieving the more serious occupations of house agency or upholstery. In these days of keen competition it becomes a matter for quite serious discussion what occupations, if any, beyond his evident sphere an architect may fitly engage in. It would often doubtless be to his pecuniary advantage to undertake house and estate agency. It must, however, always be to the detriment of his art. If such a combination can be justified at all, it should at least be by way of recognised partnership, the partner who has been trained as an architect having freedom to give his undivided attention to architectural work. It has always appeared to me perfectly legitimate, and sometimes advantageous, for an architect to take out his own quantities. He must know best his own intentions, and if he has a proper knowledge of the science, should be best able to make the quantities a true expression of those intentions. An architect in large practice will, however, not often have time for this. When the work is done by a surveyor, he should be working in full concert with the architect; and whether the quantities form a part of the contract or not, it would be better if they were always recognised and paid for by the employer. Land surveying, and the laying out and development of estates, is another large branch of work in which architects frequently engage. As regards the former, it is certainly admissible for an architect to measure and level the sites for his own works, and he should at least be able to do this. In respect of the latter, it would doubtless be much to the advantage of the estates if an architect had at east some share in their planning. In this, as n other matters, very much must depend upon he time at his disposal. I cannot see that there is necessarily in the work itself anything inappropriate or injurious to the proper exercise of architectural art. Surveying for dilapidations is another branch of work which, at least in the provinces, s always regarded as coming within an architect's practice. It is certainly one which his general experience specially fits him to perform judiciously. The question whether architects should advertise opens an oft-debated point. Much depends upon the manner of advertising. It cannot reasonably be denied to an architect to use some legitimate means of making himself known. But should not his works be his best advertisement, and why should he not place his name upon them in some modest spot, as an artist or sculptor does? There s something very different in this from the ordinary trade advertisement. For myself, I much doubt whether advertising in the ordinary trade sense is of any use to an architect; but whether it be so or not, it is utterly repugnant to good taste. The following is an actual specimen of this kind of advertising, which fortunately has not yet become common amongst architects:—“Designs for chapels and schools. Pretty, inexpensive; free from damp and echo. Upwards of eighty have been erected during the past eight years, and the demand is still increasing.” And then follow paragraphs headed:—“Architectural Beauty, Echo, Damp, Ventilation, Extras and Disputes,” &c., in all of which points the author claims exceptional success. The circular closes with an offer to forward photographs or lithographic views of chapels in various styles at a charge of 6d. each below 400 sittings, and 9d. each above. Comment is superfluous! It is not always easy to stand against the fashions of such an advertising age in which literary men and even ecclesiastics are sometimes led into the stream. But to my mind all eulogistic comments upon the creation of one's own brain are out of place, and must so tend to lower one's higher sensibilities as to become reflectively injurious to our art. It behoves us, therefore, as a Society, very strenuously to set our face against such practices. Against the acceptance by architects of commissions from manufacturers and others, it s scarcely possible to utter words too strong. Architects are doubtless often put to much trouble in selection, and the unwillingness of clients to fairly remunerate for such work is strong inducement to them to seek their commission elsewhere. But the argument is specious and insufficient to uphold what can only be characterised as deception. My aim throughout has been to demand a high standard in the exercise of our art. With class distinctions of trade and profession I have little sympathy. A calling is honourable as it is exercised honourably. Every man who does his best, whether in art or craft, is worthy of respect. But assuredly all callings do not require the same degree of ability. And without any invidious comparison it may safely be averred that the practice of architecture ranks high amongst the professions, as one making large demands upon talent, study, and close application. It is on these grounds that I would urge the limitation of architectural practice as much as possible to what is certainly the main province of the architect, namely the designing and superintending the erection of buildings.

A cordial vote of thanks was accorded to the president on the motion of Mr. HENRY LOVEGROVE, seconded by Mr. MICHAEL SHELBOURN, of Belvoir, and supported by Mr. ELLIS MARSLAND.

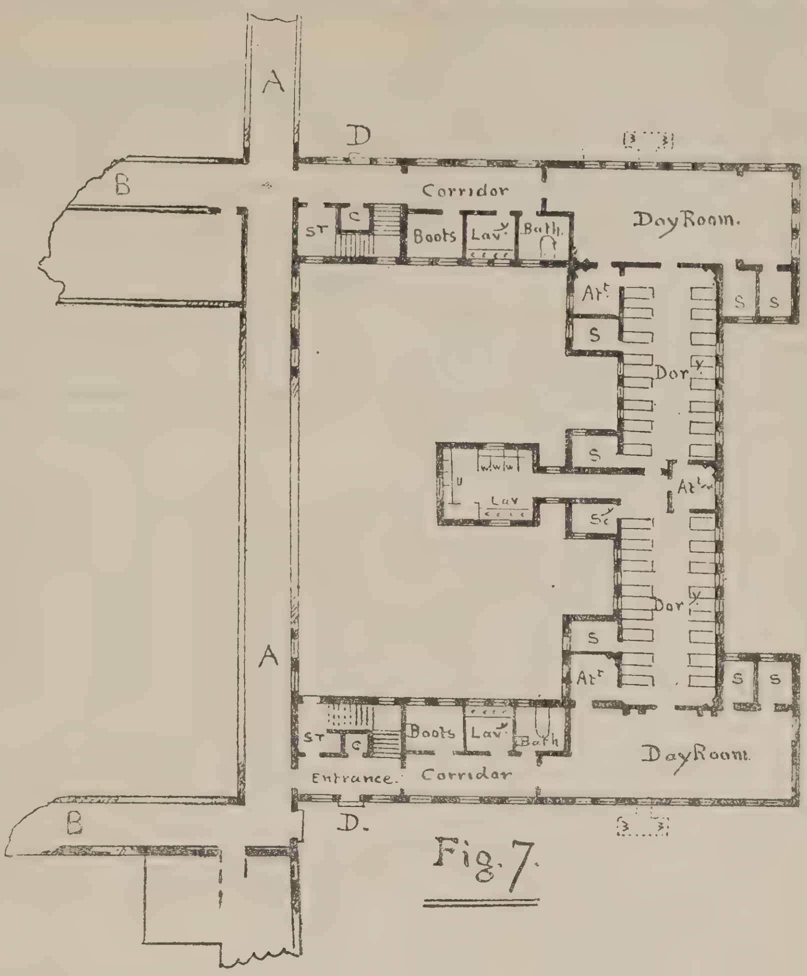

Fig. 7.

COUNTY LUNATIC ASYLUMS.—VI.

By GEORGE H. BIBBY, F.R.I.B.A.

THE WARDS FOR PATIENTS.

DURING the intervals between epileptic fits many of the patients suffer from hysteria, hypochondriacal or maniacal manifestations, and remain usually in a state of decided mental disease, are weak in memory, or have exalted ideas. Perhaps one-fifth of all epileptics are free from intellectual derangement; but nearly all even of these are often irritable, peculiar, and easily excited to passion. Epileptics are often suspicious, discontented, and suicidal. This is said to arise, in some cases, from a gradual perception of their terrible affliction, and an anticipation of its probable sad termination. “Memory fails, perception becomes dull; the imagination loses its brilliancy, and the emotions become withered. The physiognomy and deportment change; the patient becomes thick-lipped, coarse in his features, and repulsive in his appearance. As the attacks become weaker and less frequent, the mental faculties may regain their power; but owing to the rarity of radical cure in epilepsy, the majority of these patients fall into dementia.” For such persons as these the asylum architect has in most asylums to provide some accommodation; but the proportion of epileptics to other classes of patients varies much in the different districts from which asylums are filled. Some asylums (which are exclusively devoted to curable cases of insanity) have been closed against all insane persons who are afflicted with epilepsy.

The architect in planning the wards for male and female epileptics would first notice the considerable difference in the numbers to be provided for. For instance, there were in the London asylums (on the 31st December, 1893) 4,045 male and 6,009 female patients, a total of 10,054, of whom 1,171 appeared to be epileptics (596 males and 575 females); therefore, although there were many more insane females, yet there were greater numbers of *epileptic males;* but taking all classes it will, I believe, be found in most districts that there are more insane females than males. One reason for this, perhaps, is the fact that insanity is more frequently transmitted from the mother than from the father to the children. It has also been stated that when the mother was insane, more of the children became so. Further than this, in the case of daughters the disposition to insanity is inherited thrice as frequently from the mother as from the father. It follows from this, that through insanity of the mother the children generally are more endangered than through insanity of the father, and also that it is more especially the children of the female sex who inherit this unfavourable tendency. The asylum architect would occasionally be called upon to plan the wards on the male and female sides for equal numbers of patients, but more frequently for an excess of female patients, and seldom for an excess of males.

In plans for the apartments for epileptic patients, it is requisite that the attendants should have the most ample means of keeping the patients under constant observation, as the epileptic fit may occur at any time with little or no warning, and the patient fall and require instant assistance; after the fit he requires to be watched, as the attacks often follow in rapid succession. Apart from the patient's safety, the attendants and nurses require to be on the alert to prevent their charges having the opportunity of injuring themselves or others, or of committing suicide. The single sleeping-rooms must therefore be provided with small movable panels in the doors, so that the patients can be watched occasionally during the sleep that often follows a fit. The demeanour of a patient and a knowledge of his special hallucinations often indicate (for some time in advance) to an attendant what his condition is likely to be. The architect should endeavour, as far as practicable, to avoid all steps, and so arrange all corridors, day-rooms, and dormitories, &c., that a patient shall not be out of view should he fall into a fit. In Fig. 7 is shown the ground-plan of a ward for epileptic patients. Here the attendants' rooms command a view of both dormitories and day-rooms, and the single rooms are placed with direct access from the day-rooms and dormitories, thus allowing of a better means of observation than if placed off a passage or corridor.

In Fig. 7 the plan also shows that there would be a clear view of the lavatory, &c., from an attendant's room, which has been carefully arranged so as to command also a view of two associated dormitories.

In Fig. 8 is shown another arrangement of an annexe for waterclosets and lavatories, &c. An advantage of this plan is that it may be approached from the day-room and dormitory without intrusion upon the occupants of either apartment. The recessed lavatories, however, appear to be rather a disadvantage, as an epileptic patient might fall out of sight either to the right or to the left; but this arrangement has frequently been adopted, and might be sufficient in other parts of an asylum.

Fig. 8 also exhibits a plan for placing the baths in the annexe instead of in separate rooms, as shown in Fig. 7. The annexes shown in both Figs. 7 and 8 are isolated from the main building, an arrangement now usually adopted in new hospitals, asylums, workhouses, &c., and which is also shown in connection with the alternative plan for epileptics, shown on Fig. 9. In this the dormitory is arranged with four rows of beds, thereby very much reducing the building cost per patient, but at the sacrifice of much comfort and convenience both to officers and patients, and where there are large numbers accumulated in one room, troubles occasioned by excited and quarrelsome patients are greatly increased. In this plan attendants' rooms are not placed well; it would have been preferable to have located these either between the day-room and dormitory, or in a position to command (through glazed doors) a clear view of the whole apartment. Another disadvantage of this plan is the entire absence of a second means of exit from the whole of the apartments shown, to be available in the event of panic, fire, or any emergency arising through difficulties with the patients, and the chief merit of the whole arrangement is that it would be less costly to erect, and that the entrances to the w.c.'s would be under the observation of the attendants.

In the wards for the sick and infirm patients the conditions vary very considerably, for the patients may be suffering from various bodily ailments, requiring many descriptions of medical and surgical treatment, in addition to the continually changing complications arising from their disordered mental condition, bodily weaknesses, or advancing years.

A frequent arrangement of the plan of a large asylum provides a somewhat central position for the buildings for the sick and infirm, the medical officer's residence being placed between the wards for the males and females (see Fig. 1, p. 388).

In Fig. 10 is shown an arrangement for a ward for the sick and infirm, consisting of two dormitories for 10 and 19 patients respectively, with nine single rooms, a ward-scullery, and four attendants' rooms, also bath-room and lavatory accommodation. By this arrangement each of the dormitories and the large day-room could be approached from the main corridor without the necessity of disturbing patients in other rooms. All three of the larger rooms would have a southern aspect, and a considerably greater area is allowed for in the dormitories for associated patients and in the single rooms than would be necessary for healthy and strong patients.

There should be many day-rooms, so as to secure as far as possible individual observation and care. A northern aspect must always be avoided, and there should be two or more exits to every room for use in the event of panic or fire. There should be a few bay windows. These are sometimes useful in assisting the patients to form into groups for conversation and recreative purposes. The decorations of the day-rooms should be of a very bright and cheerful description. No day-room should be for more than 40 or 50 patients (allowing not less than 40sq.ft. per patient), and the height should be usually from 12ft. to 15ft., but never less.

Special observation dormitories should never be arranged for more than twenty-five beds, but for financial reasons it is too frequently necessary to greatly increase the number. In Fig. 10 the dormitories and day-rooms are shown with attendants' rooms attached, and arranged so as to command each day-room and associated dormitory.

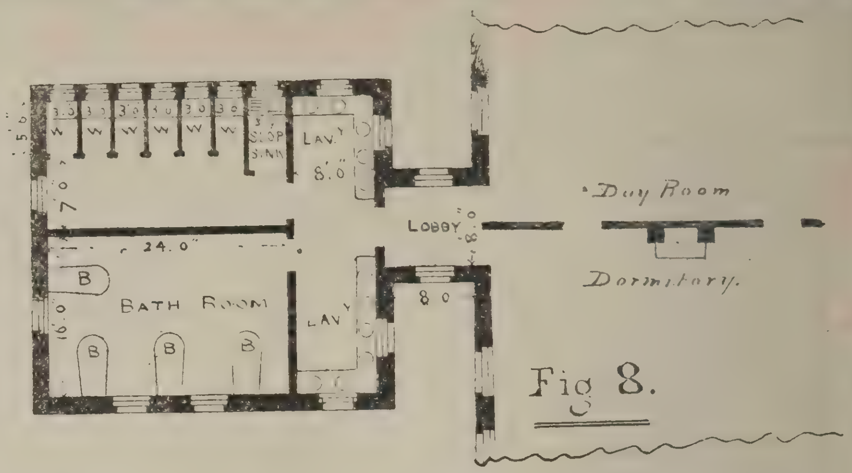

Fig 8.

All dormitories should have windows provided on both sides of the room, so as to secure a cross ventilation, and no dormitory should be less than 20ft. wide, but need not be more than 21ft. wide; this is assuming that there would be only two rows of beds—a greater number is a disadvantage (*vide* Fig. 9). The beds should be 3ft. apart, and are usually 6ft. in length.

The dormitory night attendant should occupy a central position, so as to be fairly near to all patients, and should always have the patient in front of him. In arranging the position of the beds this must be carefully remembered, and a space left for the attendant's chair, preferably upon a platform slightly raised from the floor.

The buildings for the sick and infirm patients should seldom consist of more than a ground floor and one story above. The upper floor may be arranged with day-rooms and dormitories, or with day-room dormitories. The staircases leading to the upper floors must always be of fire-resisting materials, inclosed within brick walls, and with handrails on both sides. No "winders" are admissible, and the straight flights must not contain more than ten steps each. Lavatories and bathrooms, &c., would be required in an annexe continued from the floor below (vide Fig. 11).

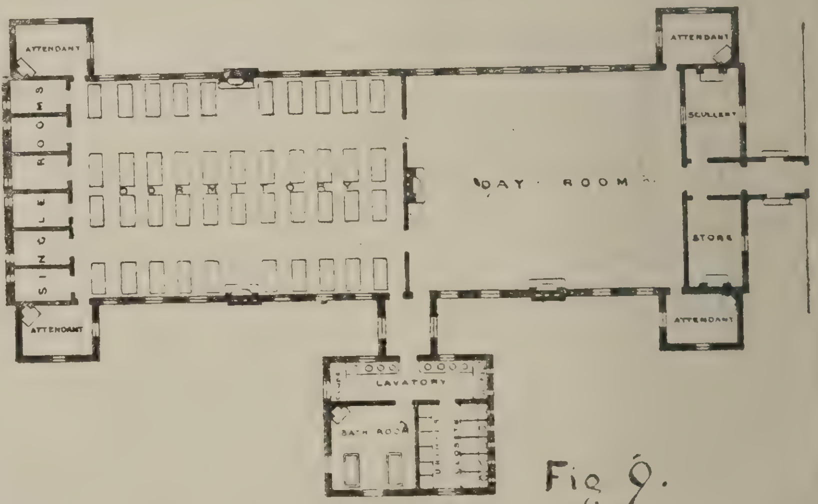

Fig 9.

GROUND-PLAN

As the attendant who has the charge of an observation dormitory ought not to be allowed to leave the apartment while on duty, he should not be required to take charge of any patients in single rooms connected with his dormitory.

Comparing Fig. 9 with Fig. 10, it will be observed that an attendant watching a dormitory in the former plan would have a view of the entrance to the w.c.'s and lavatories, an advantage which would not be obtainable in the plan shown on Fig. 10; in other respects, the plan shown in Fig. 9 is inferior.

Some authorities consider that the single rooms should not be less than 10ft. by 10ft., except those used by night only, which would be 10ft. by 6ft.; but for a county asylum for pauper lunatics perhaps 10ft. by 8ft. 6in. for the day and night single rooms and for sick and infirm, and 10ft. by 6ft. for the others, would be dimensions suitable for meeting all requirements. The doors would be arranged to open outwards in all cases, and these would have in some instances padded panels to deaden the sound caused by violent or excited patients hammering against the same, and to prevent other patients being disturbed. The single-room windows would require to be fitted with shutters, hung so as to fold and *lock* back against the side wall, otherwise opportunities for suicide would be afforded by hanging cord, sheets, &c., to the top of the shutters.

These shutters must be of strong construction, not less than 1in. in thickness. The upper half must have perforations for light and ventilation, or left open at the top for this purpose. What is required is that there shall be no *small* openings into which an actively suicidal patient could force a peg or support for any rope or material that could be used for hanging himself, nor any bars or projections which could be utilised for the same purpose. A certain number of single rooms may have double doors as additional deadeners of sound.

All doors of single rooms should have specially-made silent-action locks, indicating if locked or otherwise, and so arranged that they may be silently opened at any time by an attendant for inspection purposes, &c. For some patients, there can be no objection to an arrangement by which he may close his single-room door, and seclude himself from intrusion by other patients; but, of course, he must not be able to bolt or *lock out his attendant*, who must *always* have keys of these rooms. For purposes of inspection there must either be an opening in the door-panel, or a narrow slit-window 3in. wide, with splayed sides. Patients are said to

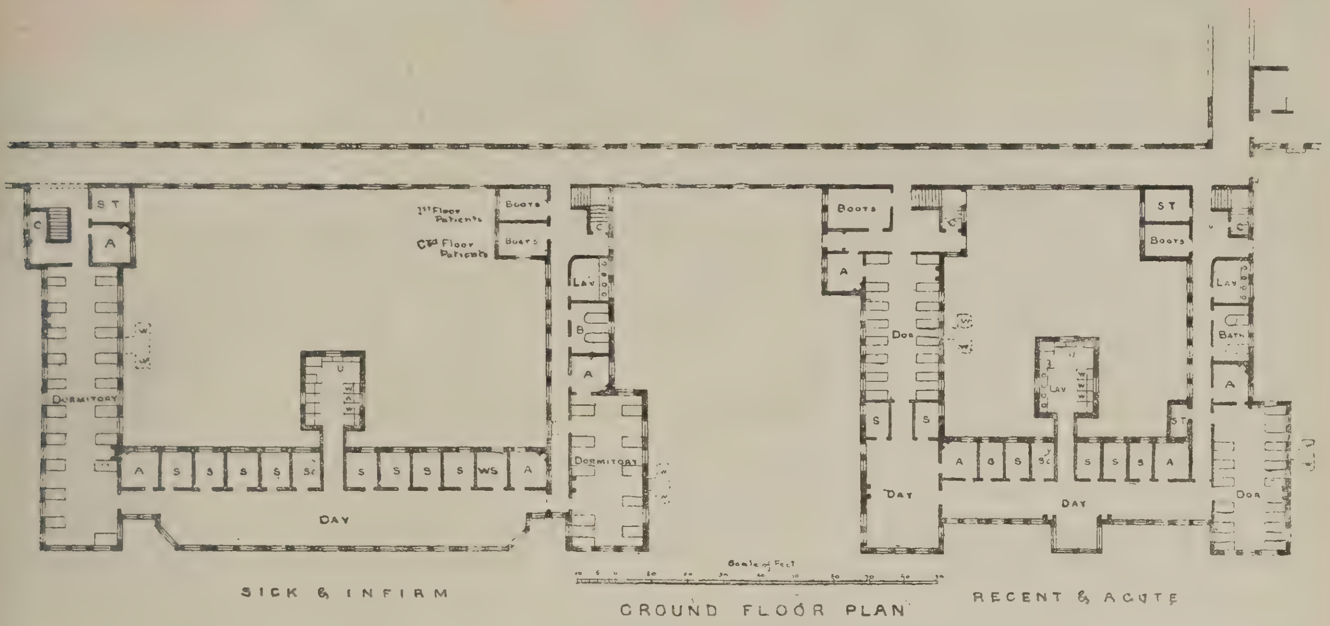

Fig. 10.

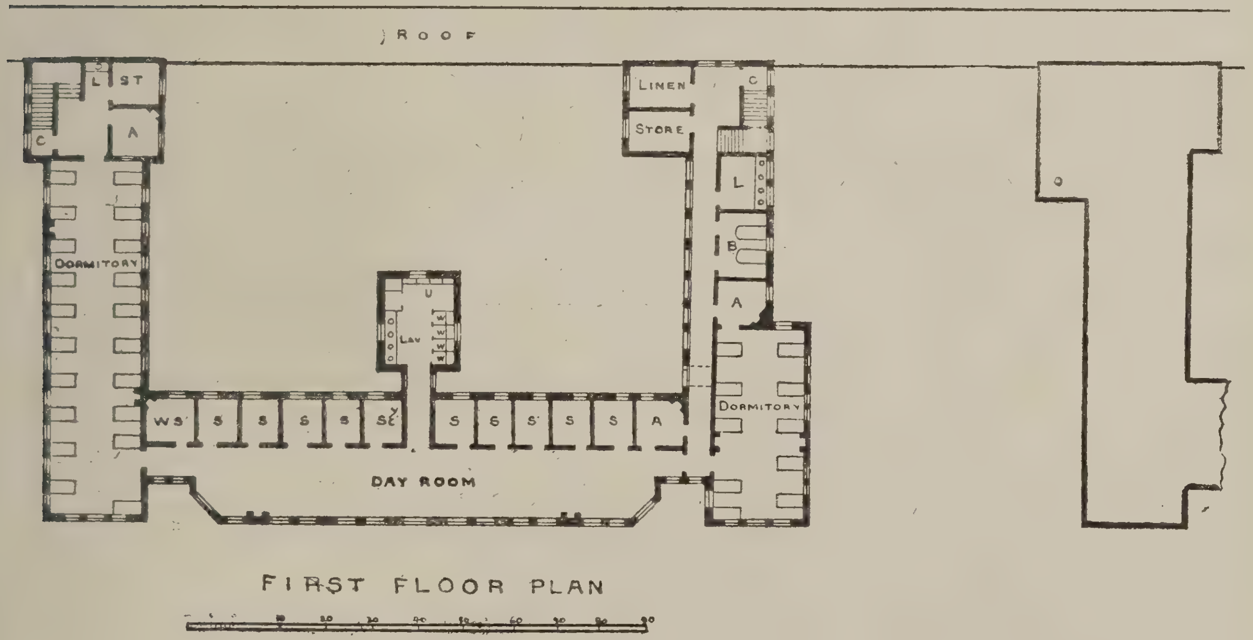

Fig. 11.

object more to the door-panel openings than to the window-slits.

On Fig. 10 is shown also a ward for recent and acute patients. This portion of an asylum should always be nearer to the medical superintendent's centre of work than the buildings for the chronic patients, but not so near as the wards for the sick and infirm.

Padded rooms are required chiefly for the protection of those patients who are not only weak, but also excitable, and liable by accident to suffer injury; but these small apartments are also necessary for preventing very strong and violent patients from purposely injuring themselves or destroying their lives.

For violent cases, the height of the padding on the walls should be about 6ft. 6in. Even in a large asylum, not more than two of these rooms need be provided—one for the males, the other for females. Any other padded rooms that may be required should be padded to the height of 4ft. or 5ft. only. The padding should be about 5in. in thickness, and as this would reduce the area of the room, the apartment must be made 10in. wider each way. (The cost of padding a room is about £60 or more.) From the offensive habits of the class of patients confined to padded rooms, it is necessary to provide for the necessity of cleaning and disinfecting the padding, which may be of leather, canvas, or waterproof materials, &c.

There should be included in the suite of rooms of all wards a small store-room provided with shelves and racks for the various appliances required for each class of patients. This room should be conveniently placed with regard to the distribution of stores and the non-disturbance of patients. For a ward of 50 patients the local store-room should not be less than about 10ft. by 5ft.

Coal stores may be placed in each ward, but it would be preferable to use coal-boxes; the latter have been found to be more economical, while coal-places have been found dangerous as affording hiding recesses.

Soiled-linen closets are frequently provided in asylums, but are not at all necessary; in fact, the clothing from the patients and all linen should be immediately sent off out of the wards to the laundry, particularly that from the wards occupied by patients of dirty habits.

Well-lighted closets for slops and brushes must always be provided; these should usually be placed in the water-closet annexe. There must be a slop-sink with cold and hot-water services. There should be a place for every article used in the cleansing of the wards and every orderly provision that can be suggested, as it is important that a good check upon the interference of patients with asylum appliances may be maintained, and it must not be forgotten that the slop and brush closet may afford patients weapons and the means of mischief to themselves and those with whom they may be associated. However insignificant some of these rooms or closets may appear, yet their improper arrangement or situation may involve fatal consequences.

Patients who are able to go out into the airing-courts, the gardens, or grounds of an asylum, and who have been working in the fields, often return (unavoidably) in a dirty or muddy condition, and it is therefore usual to provide for each ward a boot-room where they may change their boots and cleanse themselves, thereby avoiding the bringing-in of dirt on the floors and staircases of the asylum. These rooms should be provided with a suitable number of lavatory basins; it is, perhaps, an advantage to provide two doors to this room, so that the clean need not have to pass the unwashed.

The sculleries should be supplied with hot and cold water, the slop-sinks should be of glazed earthenware, and it is advisable that self-closing valves be used to prevent waste of water by patients and attendants; the sculleries should be locked from the patients when not in use, and therefore would not conveniently be placed in the annexe for closets and lavatories.

The lavatory basins should be about 2ft. 3in. from centre to centre, so as to allow the patients' sufficient space and avoid jostling each other. The basins should be of stoneware, say, *one* basin to every *four or five patients.* These should always be arranged within a proper lavatory apartment, as the ablutions should not be performed in the dormitories. The spaces below the basins should be left open. Some lavatory basins would be provided within the w.c. annexe, others in the bathrooms, boot-rooms, &c. For every *one hundred* patients not less than *five baths* are required. The ward bath-rooms should be placed near to the dormitories, or between the day-rooms and dormitories. The baths should be kept away from the walls, and there should be space all round the baths to enable the attendants (occasionally two of them) to assist or manage the patients. A desirable size of bath for the purpose would be 5ft. 6in. by 2ft. 6in. by 2ft. 3in. deep. Earthenware baths are preferable to any others. These baths are, of course, in addition to those provided in the large general bath-houses for the male and female patients respectively.

Urinals must be provided on the male side of the asylum in the proportion of *five receptacles for each one hundred patients.* The floors and walls of urinals should be lined with glazed bricks or tiles, and the divisions be of slate or stoneware. A gutter is all that is requisite. Pans raised above the floor are unnecessary. There should be an automatic flushing system to each row of stalls, acting every few minutes.

(*To be continued.*)

AN EMBROIDERY BOOK.*

LIFE is made up of desires unsatisfied and hopes unfulfilled. A new book on ancient embroidery, written in the modern spirit and by the light of modern research. This ought, indeed, to be welcomed by amateurs of the art! I open the book eagerly, and am prepared for ungrudging praise. I expect it will treat the matter seriously; it will refrain from going to the article on "Embroidery" in the "Encyclopædia Britannica" for information which was fresh—once; it will not drag in allusions to the Veil of the Temple, or to the embroidered peplos of Pallas Athene, or to Miss Linwood's woolwork portraits of distinguished people. Shall I find in it examples of the finest work of the best times, lovingly described and dwelt upon, and reproduced with all the skill of modern process-engraving? Such a good title, too—"Old English Embroidery: its Technique and Symbolism." This should be the work of a student, and fit for some more distinguished place than the "occasional table" of a suburban boudoir. Not a bit of it. The book lying on my desk is neither one thing nor the other: neither fish, flesh nor good red herring. There is no pretence of teaching stitches and methods so as to render it invaluable to the young lady who is just now beginning busily to fashion loving little gifts to bestow on her friends at Christmas; and there is no research or learning at first hand in it to give it a *raison d'être* as a monograph on an interesting and important side of Mediæval art. The book is a jumble of ill-digested notes, which the collector has not taken the trouble to verify, some of which are incorrect and others ancient history in more senses than one. And I am not saying this hastily for the mere sake of being "nasty," but speak as a specialist, and therefore impersonally regardless of private feelings. Our authors have neither spared us mention of "Babylonian skill" in needlework, nor reference to the decoration of the Tabernacle, nor yet quotations from Homer, nor airy allusions to the British Amazon Boadicea's troops arrayed in skin mantles "embroidered without" (oh, happy days of childhood and Pinnock's Catechisms, where are you fled?), nor the embroidered ravens on Ragnar Lodbrok's banner; nor the fact that "Berthe, mother of Charlemagne, was famed for her needlework"; nor *any* of the interesting facts that are set down in every handbook on needlework ever written by the hand of erring mortal. But just fancy it! Our relentless authors do not even spare us mention of the sailing of the *Mayflower*, dragged in literally by the heels, to my intense irritation, as it is a date I never can remember.

I am willing to believe that Matthew Prior is a printer's error for Matthew Paris, rather a different person, for I certainly don't intend to look up Mat Prior's inspired writings for any remarks he may have made on Mediæval garments, and indeed am almost positive that the remark in question, on page 21, occurs in the writing of Matthew Paris; so we will let this error pass. But my feelings are outraged to start with on p. 8, by a flippant allusion to the "Dark Ages," an epithet out of date now, and which reads strangely in the following passage:—"The accounts still in existence of the sumptuousness of the ecclesiastical vestments of the Dark Ages . . . . are very remarkable." In another place the writer speaks of the "bald manner" in which stuffs and what-not were described in the old inventories. Now listen to this: "Item, a canapye of red silke, with green braunchys and whyte flours poudyrd with swannys of golde betwene the branchys." This is from the rich inventories of Lincoln Cathedral: if I could describe anything as baldly as that, I should be rather proud of it. Prouder, perhaps, than of having written the following sentences:—"The taste for art needlework, which had languished during the Commonwealth, revived with other kindred arts at the Restoration, but the style was wilder and more luxuriant than the Early Renaissance it succeeded. . . . The work was lovelier than ever and richer in colouring, but the designs were outrageous." In the last sentence, the struggle to say something with a meaning is rather pathetic, but fails to convince.

The authors are under a mistake as concerns mass priests' vestments: on no occasion does a deacon wear a chasuble nor celebrate mass. They fall into the common error, too, of supposing that what are now solely ecclesiastical garments were always ecclesiastical, whereas in the Middle Ages they were merely the dress of the period. You have only to be a little familiar with early MSS. to recognise the dalmatic, alb, cope, and all the rest of it, on the back of a knight or squire in the miniatures, the more costly ornamentations naturally being reserved for the service of God, and for the glorification of earthly kings.

One chapter is headed St. Thomas à Becket, and certainly in his vestments at Sens (not a very arduous pilgrimage over the water to look them up personally) there is copy enough for a long chapter. But the Sainted Thomas is dismissed in a few words—treated, in short, in a rather summary manner, and we are off again like the butterfly from one tea-table anecdote to another, Thomas Beckett bundled out of the way, and as though he and his shining garments never had been.

But the chapter of chapters is that treating of "Domestic Embroidery of the Middle Ages" (nine pages of nicely leaded-out type), and here we are confronted with a wealth of encyclopædic knowledge that "confounds the reason and intoxicates the senses." The authors do not confine themselves to embroidery solely, but canter into other realms of art, tell us in a few simple words, understandable by the youngest of us, of the introduction of glass for windows, how they were confined for several centuries to palaces and churches, tenderly nursed, and carried from house to house by their owner at first, and so forth. I seem to be a child again at school, under the genial eye of the class-mistress, whose patience was greater than the sloth of her pupils. From windows to wood-panelling and painting on walls is a short step, and thence to the "earliest attempt at historical portraiture." Under Henry III., too, we learn that there was "very little originality or skill in these first rude attempts at art. The faces are without expression, the limbs are without proportion, and the draperies crude and ill-managed." Let us consider: Henry III. reigned the best part of the 13th century—with the 14th, the triumphant epoch of expressive art. Let it be the half-lost, ghostly fragment on a grey church wall, once glowing with life and colour; or up and down the borders of a manuscript, whose pages, like the embroidery of the same epoch, are precious as gold and jewels. Everywhere the same grace of line, the same sureness of eye, strength and delicacy of hand, the same tenderness and humour, the same power, in a word, that proclaims the artist executing his work, now, it may be, with simplicity and rapidity, and now with infinite labour and care, as circumstances demand, but never failing in his object of expressing himself and expressing life around him, graphically, sympathetically, and *humanly.* Truly spoke our authors on their second page:—"The untrained eye does not see what stares it in the face."

Why, also, have our authors labelled a bedhanging of the Late 17th century a century earlier, and the handsome pall of the Fishmongers' Company 14th century when it is obviously of the 15th century? Four of the clearest full-page illustrations are devoted to that ridiculous form of embroidery called "Embroidery on the Stump." Another illustration labelled "A beautiful curtain" wastes a whole page, while the Syon cope has one full-page illustration, of necessity very minute, and nothing else to show the scale and stitchery of this interesting piece of work. No other "Opus Anglicum" is represented, except for an indistinct, and therefore worthless, small reproduction (nicely placed in the middle of the page) of the Chesterfield cope, where the floriated arches in which the figures stand make it a very noteworthy example of 14th-century work, as interesting for costume, too, as for architecture. You may think I take embroidery too seriously; but it is worth while to consider whether needlework is of the faintest value unless of the best design and most curious and beautiful workmanship. Nothing but the utmost patience and steadiest application could have produced the work, the last few fragments of which we place among our greatest treasures, not to be replaced by all the money coined in all the smoky places of Merry England. To the wayward industry of covering this or that unsuitable object with tags and rags of stitchery I owe no allegiance, nor have I patience with a writer who can use the epithet, "chaste and elegant," to anything under heaven, or who speaks of the "art embroidery" of America. Poor America! I think the authors of this well-intentioned volume would be more at home in the sphere of modern art-embroidery; they had better leave the telling of the story of Mediæval "plain needlework" to some soberer pen. M. M.

---

* Old English Embroidery. By FRANCES and HUGH MARSHALL. London: Horace Cox, Windsor House, Bream's Buildings.

A SPECIFICATION ANNOTATED.—I.

SPECIFICATION of works to be done in building a pair of semi-detached villas at ——, for ——, in accordance with drawings prepared by ——, under whose superintendence and to whose satisfaction same are to be executed.

So far all is plain sailing; there is no disputable matter here, nor does the filling-in of the blanks require any more extensive knowledge of building than may be acquired in any art architect's office during a three years' apprenticeship. Here, however, the amateur "constructor" will stick; he can't budge an inch beyond this. What is he to say next? He does not know, for he cannot possibly explain to others—there being no metaphysics allowed here—what he cannot and does not understand himself.

GENERALLY.

1. *How Work is to be Done.*—All work in the various trades must be done in a proper, workmanlike manner, and as this description will not be again repeated, it must be understood as applying to every item in this specification.

The expression "to be done in a proper, workmanlike manner" is a venerable one. It makes up the chief bulk of many specifications, and the wonder is that the architect does not boldly cut the entire matter short by specifying at once, that "the villas are to be built in every respect in a workmanlike manner," and say no more! At any rate, the expression does good service, for when, after racking his brain for what will not come, the architect is perplexed as to how any particular piece of work should be done, then he heaves in that it is "to be done in a proper, workmanlike manner," and further description is needless.

2. *Definition of a Workmanlike Manner.*—The manner in which a skilled, intelligent tradesman, working by the hour, would perform work, as distinguished from the manner in which a handy labourer, working piece work, would perform the same, is to be taken as defining work done in a proper workmanlike manner.

Here the trouble begins! For when this neat definition is fairly landed in the specification, how is an amateur to know a good tradesman's work when he sees it? He had better consult one of the Royal Engineers' books on "Building Construction," or "ask a policeman!" There is another alternative—call in the services of a first-class quantity surveyor.

3. *The Architect's Satisfaction.*—The work done and materials supplied are to satisfy the architect, and as this specification is written with the object of describing in an intelligible manner what will satisfy him, the builder is requested, before signing the contract, to read and understand its contents, so that no dispute may arise after the contract is signed.

The clause "to the architect's satisfaction" runs in double harness, or rather tandem, with the "proper, workmanlike manner" of the last paragraph; the expression is consequently quite as venerable, though not so unwieldy in being handled when the work is in progress; for though it may puzzle the architect to tell when the work is done in a proper, workmanlike manner, it can scarcely embarrass him to say when it is done to his satisfaction, though the first clause, like the leader in the tandem, may turn round now and again to stare the driver in the face and "worrit" him; the last clause is well in the shafts, like the wheeler, and it can be made to go anywhere! Before any contractor signs a specification containing a clause such as this, which may mean anything or nothing, he should have a rigid definition of what will satisfy the architect, for the architect's certificate is given when the work is done "to his satisfaction"—not before. And suppose he persists in saying it is not done to his satisfaction, what is the contractor to do? Ask Mr. Wetherfield, Legal Column, Building News.

4. *Work is to be done in accordance with Specification.*—The builder will not be entitled to any payment on account until he obtains the architect's certificate that the work done has been performed according to the true meaning and intent of this specification.

This clause, perfectly fair and reasonable before commencing the work, unfortunately becomes obscure, at least to the builder, once the work is in progress. He does not extract the same meaning out of it as the architect does, and the strange spectacle may be seen of two men feeding out of the same vessel, one declaring the contents are meant for bovril, the other being as certain they are meant for cocoa and milk. It is of importance, then, that there be no ambiguity in the meaning and intent of the specification.

5. *Departure from this Specification.*—All instructions to the builder given during the progress of the work will be given in writing, and such instructions must be preserved, and produced when required. No verbal message of any kind involving a departure from this contract will be acknowledged in the final settlement of accounts.

This is a most important provision. The architect will frequently find himself in a muddle if he persists in giving verbal directions to the contractor or his foreman. He will be told he said this, that, and the other thing, which he may, or may not, have said; if he did say so, he will probably have forgotten it. Nor should the architect, under any circumstances, decide or answer definitely any question relating to the work without first making himself well acquainted with the provisions of the plans, specification, and quantities relating to the work in question. A good plan to adopt in visiting works in progress is to examine everything, carefully noting any departures from the plans and specification, and then subsequently, after due consideration, embody all objections or suggestions, in a general note to the contractor, of course, retaining a copy of the same. All friendly "palavers" with the contractor, or his foreman, should be avoided when the proper business of all parties is being discussed. The architect may close his visit by saying to the contractor, or foreman, "I have looked round the works, and I will communicate with you in writing my opinion of them." This the architect should do promptly, and with a view to assist the contractor, rather than lord it over or embarrass him. In fact, if the architect really knows his business, his visits will be appreciated rather than resented by the contractor, for he will frequently help, by suggestions pertinent and well timed, the carrying out in a prompt and economical manner many difficult portions of the work; but if the architect knows of nothing but his own great importance, and the corresponding inferiority of everyone else on the building, then Heaven help the contractor!

6. *Trade Customs.*—Trade customs and usages are frequently set up to define and limit the sense of some words and clauses in specifications; but what is stated herein is literally meant, and this specification is to be taken as forming portion of a special contract undefinable by trade customs and usages in London or elsewhere.

In the construction of the Britannia and Conway bridge, Stephenson specified that the "best" plates only were to be used, as it was absolutely necessary that the finest quality of iron should be worked up into girders for these important works. He was, however, much surprised to find that all the iron supplied to his specification was so bad as to be quite unfit for the work. On making inquiry he was informed that in the trade "best" meant ordinary quality in common iron, "best best" second quality, and "best best best" a good quality suitable for his purpose; in fact, he discovered that trade custom defined the meaning of commonest words, and these had no longer their ordinary signification. An architect may not have any iron plates to deal with, but trade custom defines the meaning of nearly every expression applied to timber, cement, and other building materials. For instance, a contractor ordered 50 squares of flooring "free from sap," using the actual wording of the specification supplied by the architect. When the flooring was delivered it was not only not free from sap, but the boards were unusually sappy. The contractor, on refusing to pay for the timber, was sued by the merchant who supplied it, and the latter put half-a-dozen other merchants in the witness-box, who all swore that the boarding had been examined by them, and that it was what was *known in the trade* as "free from sap." Under these circumstances the contractor was nonsuited, had to keep the boarding, and pay all the costs of the action. A quotation was once asked for, at per ton, for "best" cement. A few days after the quotation was accepted, and 100 tons were ordered, the contractor using the following expression in his letter to the manufacturers:—"Be sure you send your very best cement." When the order was completed, and the account delivered, it was noticed that 2s. 6d. per ton was charged beyond the price quoted in the first instance, and this mischarge was explained in this way:—"You asked for the price of our 'best' cement, and we gave it to you; but in ordering, you asked for the 'very best.' We charge 2s. 6d. extra for this quality." Shippers, timber merchants, brokers, and others catalogue and sell deals as "first quality" or "best"; the architect using such trade expressions in his specification may get some very unsuitable timber for his work, though it may be such as is known in the trade as "best" or "first quality." It is evident that he could not condemn such timber—for the contractor would have no difficulty in proving that the timber objected to was dealt with in the trade as first quality timber. Again, 2in. doors are understood in the trade to mean $1\frac{3}{4}$in., $1\frac{1}{4}$in. flooring only about 1in., and $\frac{3}{4}$in. matchboarding holds not more than $\frac{1}{2}$in. and $\frac{1}{16}$in. Hence the necessity for a clause such as that at the heading of this division, and it will always be advisable that the architect should make himself thoroughly acquainted with the exact meaning, in the trade, of tne terms he employs.

7. *Figured Dimensions.*—In all cases where dimensions are marked on the drawings, or herein specified, they are to be taken in preference to measurement by scale, unless there is an obvious error in the former, and all such dimensions are to be the net dimensions of the work when finished.

In every instance where possible, all lengths, breadths, and heights should be distinctly figured on plans, sections, and elevations, care being taken that all running dimensions across rooms and walls, when added, make exactly the total lengths figured elsewhere. It is necessary to be especially careful that dimensions on upper-floor plans correspond with, or work in with, those of floors underneath, and that figured heights on sections correspond with those on the elevations. The thickness of doors, scantlings of timbers, &c., may be all marked on the drawings. These latter will then become a condensed specification, admitting of easy reference. The contractor should be furnished with a set of drawings or mounted tracings. Tracings on cloth are liable to have the lines washed off in the rain, and when the original glaze or stiffening disappears, the foreman, on an emergency some cold frosty morning, is tempted to use them as pocket-handkerchiefs!

8. *Scaling Drawings.*—Measurement by scale from drawings plotted to less than $\frac{1}{2}$in. to 1ft. is to be avoided, and drawings, when finished to a large scale, are in all cases to be held as superseding drawings for the same portion of the work to a smaller scale. No enlargements of mouldings are to be made from small-scale drawings. All such will be furnished full-size by the architect.

No two people will read off the same dimensions from small-scale drawings in the absence of figured dimensions. Full-size templets of mouldings—enlarged by the foreman from small scale drawings—often totally misrepresent the architect's intentions. All enlargements necessarily made on the site of the building, as, for example, tracery windows, if not made by the architect or his assistant, should be inspected, and certified correct by the architect or his representative before the work is actually commenced.

8. *Laying out the Works.*—The builder shall provide all rods, straight-edges, squares, levels, pegs, and lines for laying out the building, and be responsible that all dimensions are in strict conformity with the drawings.

This clause implies that the drawings are correctly and consistently figured, which is very often not the case. All lengths are to be laid down with 10ft. rods, shod with brass and correctly graduated, or with a Chesterman's steel ribbon "tape," for the ordinary tape will stretch 4in. or 5in. in every 50ft., the exact length depending on the tension for the time being. It cannot be urged too strongly that the squareness of all rectangular spaces should be tested by diagonal measurement, more especially where the boundary lines are obtained by producing the sides of the square used in laying down the right angles. The square or squares used in laying out foundations should have sides not less than 12ft. long, and should be strongly framed. Where the building is over 50ft. long on either side, the first course of brick or stonework above the ground should be levelled throughout with a dumpy level, for the ordinary practice of levelling with a straight-edge and spirit-level, though fairly correct for short lengths, is altogether unreliable, in ordinary hands, for lengths of 50ft. and over. Moreover, as with an engineer's level, all points can be fixed from one station by merely turning the telescope on its axis, a great saving of time is effected, and absolute accuracy secured.

THE SURVEYORS' INSTITUTION.

At the opening meeting of the 1894-95 session of the above society, held on Monday evening last, at 12, Great George-street, Westminster, the new President (Mr. Thomas Chatfeild Clarke) delivered an inaugural address which has, for our readers, a more than ordinary interest, from the fact that the President represents the architectural branch of the surveyors' many-sided profession. After referring to the growth of the Institution during the twenty-two years which had elapsed since he was elected a member of the council, Mr. Clarke proceeded to emphasise the necessity which compelled all professional men, and especially men whose very avocations depended upon practical sagacity, to move with the times, and to carefully watch the direction in which public thought was day by day altering. He looked with hope to the time when the extension of small ownerships would enable our country to possess so powerful a reserve force as that insured to France or Belgium by the system of peasant proprietorship. Mr. Clarke then dealt exhaustively with the question of the practicability of some system of agricultural credit banks, such as have worked with good results on the Continent, being applied to the relief of the undoubted distress which exists among our own farmers. But the matters which more nearly affect the interests with which we have to deal were referred to later in the president's speech. The more healthy housing of the working classes, of which Mr. Clarke has been a persistent advocate for many years, was, he reminded his hearers, gradually being accomplished by legislation, which all must welcome as tending to a useful end. Great as had been the work done in this direction by such bodies as the Peabody Trust and the Industrial Dwellings Companies, it went but a small way to meet the ever-growing demand for better accommodation for the working classes. It was no doubt true that from causes difficult to define the rate of increase of the population of London had steadily declined 21·2 per cent. in the decade ending with the year 1851, to 10·3 per cent. in that ending with 1891; but even at the decreased rate some 400,000 persons were added to the population of the Metropolis during the last ten years. The density of population was shown that in some districts, notably St. George's-in-the-East, 22 per cent. of the whole population were members of families each occupying but a single room. Mr. Clarke thought that owners of large estates, City companies, and others might well extend the practice, which, he was glad to see, obtained to a considerable extent, of devoting a large proportion of their landed estates to the erection of dwellings for the industrial classes. There had been no more important legislation in recent years than the London Streets and Buildings Bill, which, as the London Building Act, 1894, received the Royal Assent on the 25th of August last, and it may be interesting to quote the President's own words: "It may be worth while to place on record in this address the genesis of the new measure, and to indicate the leading share which the Institution has had in moulding its provisions in the various stages of its evolution. For many years past it has been felt that the Act of 1855 has been outgrown by modern requirements, and that the existing law was insufficient for regulating many details of new construction and materials. Endeavours have been made to cure this by several auxiliary enactments, and by by-laws framed by the Metropolitan Board of Works, and subsequently by the London County Council, under the Metropolis Management and Building Acts Amendment Acts, 1878 and 1882. It was felt, therefore, that the time had come for the codification of the law relating to building, and the first step taken in the matter was the production of a draft Bill under the title of the London Building Law Consolidation Bill, issued by, and apparently prepared under the auspices of, the Local Government Board. Copies of this draft Bill were forwarded to the Institution, and to other societies, accompanied by a request that the Institution would furnish the Department with comments on the Bill. The council pointed out, in reply, that what was really wanted was not consolidation, but a new Act; but, on being further pressed for suggestions, they appointed a strong committee, who devoted a large amount of time and labour to the work of engrafting on the Consolidation Bill the additions and amendments in their opinion necessary for making it a useful working measure. The matter apparently slept until, in December of last year, the council received copies of a new Building Bill, prepared by the London County Council, embodying some of the suggestions made by the council of the Institution to the Secretary of State in connection with the Consolidation Bill already referred to. The Building Committee of the Institution devoted a very large amount of time to the consideration of the new Bill, and finally nominated their colleagues, Mr. Rickman, Mr. Garrard, Mr. Steward, and Mr. Cubitt Nichols to represent the Institution at a conference with the Building Committee of the London County Council, and to press the adoption of the amendments proposed by the Institution. They were met in the matter in the most friendly way by the representatives of the London County Council; but, failing to obtain concessions on some important points, they were authorised by the council to draw up and lodge a petition in opposition to the Bill. After a prolonged fight in the committee rooms of the House of Commons, the representatives of the Institution (for this purpose Mr. Steward, Mr. Garrard, and Mr. Cubitt Nichols) succeeded, themselves or in concert with others, in modifying, or getting rid of, most of the more obnoxious features of the Bill, and were able to appear, in support of the greater part of it, before the Committee of the House of Lords. The council—and particularly those members of it to whom I have referred—have spared neither time nor trouble in the endeavour to secure a Building Act worthy of this great Metropolis, and, although it has involved the Institution in an expenditure of nearly £900, the members will, I am certain, feel that the money had been well bestowed."

The subject of "betterment," which had been discussed *ad nauseam*, must, Mr. Clarke thought, be for the present regarded as in a state of suspended animation. It was only the very extreme opponents of the principle who ventured to deny that, in the words of the House of Lords' report, "persons whose property has clearly been increased in value by an improvement effected by local authorities should specially contribute to the cost of the improvement." The whole difficulty arose from the incertitude of the effect of any given public work in increasing the value of neighbouring properties, and the evidence given before the House of Lords committee showed how acknowledged experts differed on this point. The proposal to give the person to be charged with "betterment" the option of going before a jury was not above adverse criticism, for a jury summoned *ad hoc* was in a less advantageous position to decide such a matter equitably than would be an arbitrator dealing with all matters arising under a particular scheme. The "worsement" principle reduced to its narrowest limits by the proposal of the Lords Committee was, he thought, an almost negligible quantity. After dealing with the report on the unification of London, which he regarded as a step in the direction of settling a question which demanded some solution in the near future, the President desired to place on record the very interesting fact of the presentation this year, at the end of 25 years of unwearying service in the interests of the Institution, of a testimonial to Mr. J. C. Rogers, the valued secretary of the society.

A hearty vote of thanks to the President for his address was proposed by Mr. C. K. Bedells, who alluded gracefully to the many services which Mr. Clarke, during his long membership, had rendered to the Institution, and the vote was seconded by Mr. W. Wright, who considered that the many valuable suggestions contained in the address might well form matter for future discussion and consideration.

The President, in replying, said that while he considered honest difference of opinion and free discussion most valuable for the purpose of eliciting the truth, he had endeavoured, as he felt bound to do on such an occasion, to avoid offending the susceptibilities of everyone who might differ from him on points which had at least two sides. The vote of thanks having been carried by acclamation, the meeting adjourned.

THE INSTITUTION OF CIVIL ENGINEERS.

THE opening meeting for the session of this institution was held on Tuesday night. Sir Robert Rawlinson, K.C.B., the president, delivered an inaugural address, dealing with the history and progress of all branches of civil engineering. Of all these branches no more remarkable progress had been made, he said, during the last half-century in any one department than in that which was concerned with the health and personal well-being of mankind. Sanitary science was, in a sense, as old as civilisation; but it might puzzle a lexicographer to give a satisfactory definition of it, and sanitary engineering, he might reasonably say, was not a science. Sanitary science based its results on scavenging, town sewering, house-draining, and on insisting upon all means for domestic and personal cleanliness. Among the principal of the improvements brought about by the progress of sanitary science, after main-sewering, house-draining, water supply, and scavenging, had been the establishment of public baths, washhouses, and disinfecting apparatus. It had become usual to credit sanitary works, such as sewerage, drainage, and improved supplies of water, with the observed reduction of deaths in this district, and he was not inclined to repudiate this. But he also saw other powerful influences at work on this great and most interesting problem. There was no problem of sanitary engineering of vaster range than that presented by the great metropolis. At present the streets of London were crowded to a dangerous excess with sewers, drains, water-pipes, gaspipes, telegraph and pneumatic tubes, electric-lighting cables, and hydraulic pressure mains. Yet the main low-level sewers of London were now too small to relieve the area bordering the river. It had at times occurred to him that deep tunnel sewers, in lines irrespective of those of the streets above, might be found necessary to relieve the streets. In Paris there were such large underground tunnels for sewers, gaspipes, water pipes, and telegraph tubes and wires. The sewage of London, now wasted at great cost to the ratepayers, might be taken to the Maplin sands, and on its way be delivered in dressings of liquid sewage over the poor adjoining lands. A question of vital importance was that of the present and the future water supply to the ever-increasing millions who lived and worked in London. The supply of water to London was still derived mainly from open rivers, the Thames and the Lea. The important questions were:—Must these sources be continued? Must the interests of the water companies be bought? And, then, must there then be consolidation of management? If so, under the London County Council, or by a special water trust? The sources of both the Thames and the Lea were as pure or as free from objection as it would be possible to find water. The works were owned and managed by companies. Consolidation and purchase seemed practicable, and then any necessary extensions could be made. To bring in rival companies and to attempt to lay additional mains in the already choked streets of London would be impossible. To bring in soft water from long distances would be costly. Additional supplies of water for London might be obtained in or near the areas through which the Thames and the New River flowed.

CHIPS.

The governors of the Northampton General Infirmary have decided to carry out forthwith the first section of plans by Messrs. Hall and Young, of London, for a new north-east wing to be added to the infirmary buildings, at an estimated cost of £2,000. The addition will provide a new operating theatre, and will be temporarily roofed in.

The Holborn Board of Guardians are about to carry out works of alteration and reconstruction at the City-road Workhouse, estimated to cost £7,000. Mr. A. Saxon Snell is the architect.

The Cheshire County Council have decided to purchase Saltersford Hall, Holmes Chapel, as a site for an agricultural college. The house will accommodate 70 students, and is surrounded by 100 acres of land. The necessary alterations are estimated to cost £2,800, and a further £1,000 is to be expended on stocking the farm.

Works of water supply have just been completed for the parochial committee of Wootton-under-Edge. Mr. Ambrose was the contractor, and the cost has been £3,300.

The German Emperor conferred again on Saturday with the artists whom he has intrusted with the sculpture of the statues of the seven Hohenzollern Sovereigns for the White Hall. He criticised the models, but was satisfied on the whole. As to the material, he is at present in favour of marble.

All Saints' Church, Norfolk-square, which was destroyed by fire in June last, is to be rebuilt immediately. Mr. Ralph Nevill, F.S.A., of Chancery-lane, is the architect. To complete the church according to Mr. Nevill's designs, the vicar and churchwardens are asking for £2,500 beyond what is at present in hand. It is hoped that the church will be completed soon after Easter, 1895.

The length of railways in the island of Ceylon is 231½ miles, 40 miles having been added during the past year, and the traffic yielded last year a profit of 4·5 per cent. on the original outlay.

The town council of Evesham at their annual meeting on Friday, after a long discussion, decided to increase the salary of Mr. R. C. Mawson, the borough surveyor, by £45 a year, and that of Mr. Mann, the road surveyor, by £15.

A portrait of the late Sir Rupert Kettle, the well-known County Court Judge, and originator of arbitrations in trade disputes, executed by Herr Voss, has been presented to the art gallery of Wolverhampton, and a second portrait of Sir Rupert, by the late Frank Holl, R.A., is on loan at the same institution.

The west window of Hanbury Church, Staffs, has been filled with stained glass as a memorial to the late vicar. The chief subject is our Lord in Glory, and below it is a full-length figure of Melchisedek. Messrs. Ward and Hughes, of London, were the artists.

All Saints' Church, The Clive, near Yorton, Salop, was restored and enlarged from plans by Mr. C. J. Ferguson, of Carlisle, in 1887. Through the munificence of Mr. J. J. Bibby, of Hardwicke, it has now been again enlarged, and still further beautified. A new tower and spire have been erected by Mr. Bibby in memory of Mrs. Bibby, who died on the 19th of May, 1892, and, in addition, he has given to the church a font, six bells, and other gifts, and these were dedicated last week by the Lord Bishop of Lichfield.

OLD MASTERS ON THE CONTINENT, NO. XI.—"SACRED AND PROFANE LOVE," BY TITIAN.

Mr. Charles L. Eastlake, the Keeper of the National Gallery, who is contributing the descriptive articles which accompany our series of Old Masters, is prevented from writing anything about the famous painting by Tiziano Vecellio, which we illustrate to-day from the Borghese Gallery, Rome, because he has not lately seen the picture, and the original notes which he has concerning it are not sufficient to justify a full description of the work. This rule, which Mr. Eastlake always rigidly adheres to, materially enhances the value of his writings, for in no case have particulars of any work been given by Mr. Eastlake unless they were based upon notes recently made from the original painting. We are, however, desirous of making our choice of subjects as complete as possible, and consequently there are a few pictures selected for our series of Old Masters which will appear without the advantage of Mr. Eastlake's descriptions. "Sacred and Profane Love," illustrated to-day, constitutes the first of these. The original, which is one of the most beautiful and fascinating of Titian's works, forms one of the most valuable treasures exhibited in Room X. of the Borghese Gallery. In conception, as well as in colour, the composition illustrates in a marked degree the influence of Giorgione, which may be traced with equal certainty in some other of Titian's works. Like the same master's exquisite picture of "The Three Ages," in the Bridgwater House Gallery, this conception realises the poetic sense in the truest degree, while the melting harmony of its colour is to the significance of the composition what music is to the song. "Earthly and Heavenly Love" seems to describe the painter's ideal better, though some have thought that "Love and Prudery" more exactly expresses the intention of the painting, seeing that the draped figure is so completely clothed as to be gloved even, as she sits serenely secure in the stronghold of enshrined modesty. The calm sense of the delight of pure existence herein constitutes the dominant feature of Titian's creation. The contrast between the nude conception of earthly amours exhibits really no anomaly between the two maidens which illustrate his idyllic theme. The spectator, indeed, involuntarily partakes of the dreamlike feeling which it suggests. The plucked rose on the top of the sarcophagus fountain, whereon in bas-relief a Cupid is shown awakened out of his slumbers by genii castigating him into action, while a pair of lovers in the distance serve to illustrate his influence, and rabbits in the middle distance indicate the joys of the undisturbed state of natural being, in contradistinction to the mixed pleasures of the chase exemplified by the hound to the right of the principal group hunting a faun. The draped beauty is said to be very like the Flora and the Bella in the Palace Sciarra. Ridolfi, writing in 1646, speaks of the picture: "Due donne vicino ad un fonte, entro a cui si specchia un fanciullo."

CHURCH OF ST. AGNES, KENNINGTON PARK.

This, without doubt, is one of the most interesting churches erected of late in London, and its completion has been gradually going on for the last twenty years. A plan and view of the exterior, drawn by the late Fred C. Deshon, was published in the Building News for July 16, 1875, soon after the commencement of the buildings, which comprise as well a parsonage house and schools, the whole forming an extensive and exceedingly picturesque group overlooking the park at Kennington. Mr. George Gilbert Scott, M.A., was the architect from whose designs the work has been principally carried out; but more recently, since his illness, Mr. Temple Moore has acted in that capacity, the pulpit and font cover having been done from this architect's plans. The photograph which we reproduce to-day was taken by Messrs. Fry Bros., of Brighton, and the view illustrates the building with fir-trees standing under the arches of the nave, a novel and effective method of festival decoration. A great feature is made of the gallery over the chancel screen, and the rood-beam is a conspicuous and very handsome adornment to the sanctuary; but the brass grilles below in the screen itself are out of character, and quite disfigure the choir. It will be remembered that when we gave the previous illustrations of this church, to which reference has already been made, a curious and somewhat contentious correspondence took place which brought forth some admirable letters from the pen of the late John D. Sedding, who warmly, and very rightly, commended the originality and suitability of Mr. Gilbert Scott's design, although, perhaps, technically, exception might with some show of reason be taken against a few insignificant items of detail. The tower and spire, which some critics found fault with, has not been carried out, and the omission of this feature is possibly an advantage. Mr. Sedding's remarks will bear repetition after the lapse of twenty years, during which time he exhibited in his own works the principles which he admired so warmly when they were to be found in other men's designs, and his opinion, now that he has passed away, serves to re-echo the teachings of his master, the late George Edmund Street, whose principles were, in their turn, based upon the lead of Sir Gilbert Scott and Welby Pugin. The younger generation of Gothicists carried church development a stage further, and among these none with more success than Mr. G. G. Scott. Sedding thus commended what he called the "superficial qualities" of the design of St. Agnes, Kennington, which he specified as follows:—"1. A carefully thought-out plan of an English church suited to the exigencies of modern worship. 2. An entire mastery of the details and spirit of English Gothic, as manifested in ancient examples. 3. A simplicity and natural quaintness of treatment, the more valuable as it opposes the tricky picturesqueness and theatricality of the half-assimilated Gothic of much contemporary work. 4. That is is an independent effort, based on a period of English architecture almost wholly unrepresented in modern design. And let me add that the individual character and unmistakeable sincerity displayed in this design should merit the hearty approval of all well-wishers of the Gothic School of England."* Those who take an interest in church design, and have not yet seen this group of buildings, will find that a visit to Kennington will be well worth making for the purpose. We venture to think that the pulpit is hardly so successful as some other parts of the church and its furniture. The font cover is probably not yet finished. The façade of the vicarage facing the park is an extremely effective example of quiet and unassuming design.

LYDDINGTON BEDE HOUSE: PUGIN STUDENTSHIP DRAWINGS.

About three miles from Gretton is this prettiest of Rutlandshire villages. The Bede, or Almshouse, is charming in outline and detail, as well as colour, in lichened and ivied walls, of deep yellow and grey stone, and tiled roof. Originally a manor-house of the Bishops of Lincoln, it was founded as a bede-house by the First Earl of Exeter. The quaint wood cloister, or, more properly speaking, "verandah," on the other side, gives access by a staircase to the hall above, lit by the oriel and large windows seen in the sketch. These are still glazed with the old quarries of diamond shape, bearing devices of the rose and lily, with the mottoes "Delectare in Dno" and "Dns exaltatio mea." The very uncommon wood cornice and panelled ceiling of this room were added during the earlier half of the 16th century. R. Shekleton Balfour.

[We gave some other illustrations of this charming old bede-house, from the pencil of Mr. J. Alfred Gotch, F.S.A., in the Building News for August 18, 1882.—Ed.]

ST. ALBAN'S ABBEY, HERTS.

These sketches by Mr. F. G. Kitton appear in Mr. Chas. H. Ashdown's capital book, "St. Alban's: Historical and Picturesque," which we reviewed in our issue for March 23rd last. Mr. Kitton's drawings add greatly to the permanent value of that work. The upper view given on our accompanying plate shows the church from the N.E., with Lord Grimthorpe's masterpiece of design which he added in rebuilding the north transept. His transfigurations to the choir and Lady chapel have since been completed, and remain a monument to his taste and knowledge of architecture—qualifications which seem to afford his lordship much satisfaction, though no one of any repute in the art world has publicly confirmed this approval or condoned his productions. Mr. Kitton's sketch is rather too small to exactly define the detail of the new work. The second sketch shows the historic gateway to the west of the church, and once belonging to the old monastery.

HOUSE AT WALMER.

We illustrate this week, by perspective and ground and first-floor plans, a brick and tile-hung residence at Walmer, near Deal. Mr. Arthur Keen is the architect.

MEMORIAL TO THE LATE C. W. COPE, R.A.

This characteristic memorial is situated in Maidenhead Churchyard, and has been well executed in brown Portland stone by Messrs. Farmer and Brindley, from the refined and effective design of Mr. J. W. Simpson, architect, of London. The lettering and palm branch on the monolith shaft of the monument are in bronze, cast by Mr. H. J. Allen. The figures, flanking the base of the shaft of the cross, were modelled by Mr. Arthur Cope, the portrait painter, son of the late C. W. Cope, R.A., to whose memory this cross has been erected. It will be remembered that some of the frescoes which decorate the Houses of Parliament were painted by him. The drawing herewith reproduced was exhibited at the Royal Academy this year.

◆

The second of a series of fortnightly lectures, organised by the Art Galleries Trust of the Glasgow Corporation, was given on Saturday night by Mr. Alexander M'Gibbon, A.R.I.B.A., on "Gothic Architecture: its Place and Power," when the attendance was so large that many were unable to obtain admittance to the hall in the Corporation Art Galleries, where the lecture was delivered.

The Lord Bishop of London visited Finsbury Park on Saturday for the purpose of consecrating the new church of St. Olave's, Woodberry Down, which has just been erected from the proceeds of the sale of the site of St. Olave's, Old Jewry. The pulpit and font have been brought from the old church, and the communion plate from the church of St. Margaret's, Lothbury.

For some years past the Board of Trade have been losing the foreshore between Dover and St. Margaret's Bay, owing to the encroachment of the sea, and the lighthouses and other buildings on the cliff are likely to become endangered. It is proposed to let the cliffs be escarped by the convicts still at Dover, and the town will find paid labour to reclaim about 300ft. of land under the whole three miles of cliff.

An inquiry was held at the Public Hall, Erdington, on Wednesday week, by Colonel Ducat, R.E., with respect to an application made by the Aston rural sanitary authority to the Local Government Board to sanction a loan of £1,150 for extension of sewers within the district. The engineer, Mr. J. E. Wilcox, C.E., of Birmingham, explained the plans.

New Technical Schools &c in connection with the Wedgwood Institute Burslem : Ford & Slater Architects

WEDGWOOD INSTITUTE, BURSLEM.

THE Wedgwood Institute, the additions to which were formally opened on the 15th ult. by the Princess Louise, is a commanding edifice, with its principal façade to Queen-street, which is near the centre of the town, and the foundation-stone was laid on Oct. 26, 1863, by the Right Hon. W. E. Gladstone. The style of architecture adopted is emblematical of the arts of the district, and illustrative of the use of terracotta, and in the Pointed style based upon those types of Ceramic architecture so prevalent in Northern Italy during the 15th and 16th centuries. The building, previous to the recent additions, comprised a school of art, a laboratory, and a free public reading-room and lending library, the Free Libraries Act having been adopted by Burslem, the first of the Pottery towns. On entering the building from the main entrance in Queen-street, on the ground floor on the left is a large reading-room, whilst on the right is a lecture-hall with two classrooms, and from the entrance vestibule is seen the grand staircase leading to the upper floors. The first floor was devoted to art classrooms and a museum, whilst the second floor was devoted to science classes. The important additions to the Institute, which have been designed by and carried out under the superintendence of Messrs. Ford and Slater, architects, Burslem, comprise two blocks of buildings, and these are the buildings the opening of which was the occasion of the visit of her Royal Highness. One block of buildings is on the Baker-street side, and is three stories in height, with basement in addition. The ground floor comprises two large modelling rooms. On the first floor is an antique classroom, above which is a large laboratory, in connection with which is a lecture theatre, classrooms, balance-room, and master's room.

Several years ago, owing to the liberality of Mr. W. Woodall, M.P., a museum was erected at the rear of the Institute, but this has been removed to another position, and the building is now utilised partly in connection with the school of art, and partly by the Science Department. The second block of building referred to is on the Brickhouse-street side, and is four stories in height, and this, on the ground floor, provides a large reference library and an extensive department for the librarian, and the reference library is so arranged as to be in conjunction with the reading-room. On the first floor is a large classroom for elementary art, whilst on the second floor are provided two classrooms for technical instruction, and on the top floor is a gymnasium, or it might be used in conjunction with the technical schools.

On the Baker-street side the architects have purposely had regard to plainness of design, inasmuch as this portion of the building is somewhat excluded from view; but as regards the elevation in Brickhouse-street, this has a very imposing and pleasing effect. The elevation is carried out to accord with the original part of the building so far as its height extends; but in order to gain as much room as possible, this addition to the Institute is carried up considerably higher than the original building, and in consequence of the additional height so given to this part of the building, it forms a most distinctive and bold feature from many points of the town.

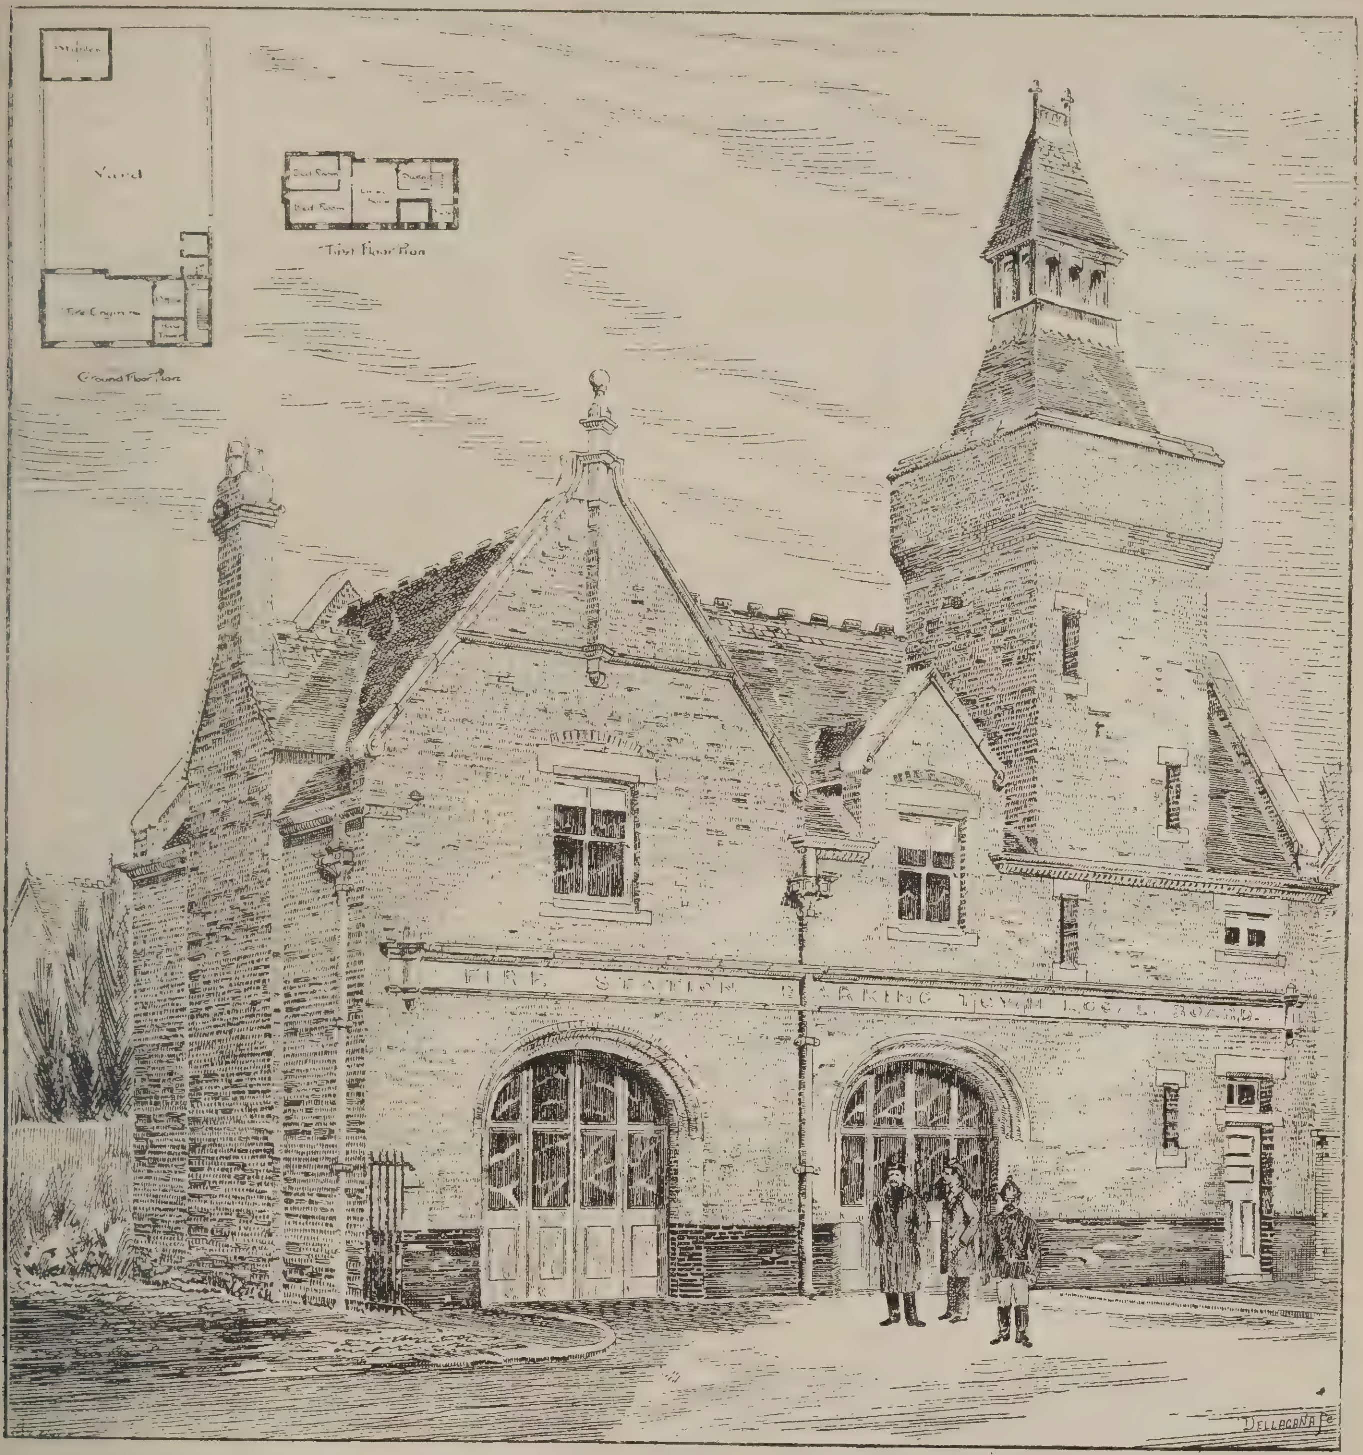
The walls of the buildings throughout are of red brick, with strings and dressings of terracotta, the floors being of fireproof construction of tiles laid on concrete, resting on iron girders. The various rooms are warmed by hot water on the low-pressure system.

The building contracts have been carried out by Mr. W. Grant and Mr. W. Cooke, builders, of Burslem. The cost of the additional buildings, including fittings and heating, including also several alterations, and the redecorating of the original building, is upwards of £5,000, the bulk of which is defrayed by voluntary donations intended to commemorate the Jubilee of the Queen.

* * *

A stained-glass window has been placed in St. Luke's Church, Southampton, as a memorial to the late Captain J. H. Buckler, of the Royal Mail Steam Packet Co. The work was intrusted to Mr. C. E. Kempe, of Nottingham-place, London. The window consists of two lights, with a circular light at the head. In the two principal lights are the figures of St. Peter and St. Stephen. Beneath these figures are allegorical representations of "Faith" and "Hope." In the circular light is an angel bearing a scroll. On the wall under the window is a memorial brass, by Messrs. Hart, Son, Peard, and Co., Limited, London, bearing an inscription.

At the last meeting of the Gravesend School Board it was decided to give notice to Mr. Rayfield, of Northfleet. the contractor for the schools in Wrotham-road, of the intention of the board to enforce the full penalty of £20 a week, due under the contract, for the five months' delay in the completion of the buildings. The contract was taken by Mr. Rayfield at £6,888, the buildings to be completed within six months, and the clerk mentioned that the builder demurred to signing the contract at first because he considered the time was not sufficient, but he gave in on the understanding that clemency would be extended to him. Mr. Stephens, a member of the board, said it was always apparent that sufficient men were not employed, owing to the fact that Northfleet men were given the preference. Mr. Rayfield would not employ Gravesend men, and as a Gravesender, he did not think Mr. Rayfield could expect much clemency from the board.



BARKING·TOWN L B FIRE STATION CHAS J DAWSON·F.R.I.B.A ARCHITECT

CONCRETE BRIDGE OVER THE DANUBE.

A CONCRETE bridge has been constructed over the Danube at Munderkingen, Germany, with a single segmental arch of 164ft. span, and 24·6ft. wide, an illustration of which appears in the *Engineering Record*. The abutments are of concrete on piles at an angle of 15° with the vertical, and are of considerable width, to equalise the pressure over the piles. A pressure of 15 tons per square foot is obtained on the rock abutment on one side, while on the other the pressure is less than 3 tons per square foot, this being on gravel and piles. To increase the security, joints were made at each abutment and at the crown; these joints allow the crown to rise and sink without causing cracks. The arch has a rise of 16ft. 4in. in the centre. Calculations were made for a live load of 82lb. per square foot, and the thickness at crown is 3·28ft., and 3·61ft. at the abutments. The arch curve was determined experimentally, and is approximately the line of pressure under full loads. On the left side, the arch has a radius of 213ft., on the other half, two-thirds of the soffit has a radius of 230ft., and the remainder 151ft. From the description, it will be seen that the arch forms two rigid segments of concrete, jointed or hinged at the abutments and crown, and these joints have abutting surfaces of steel in 12 separate parts in the width of bridge. These devices distribute the abutting pressure on steel bars over the concrete section of arch. The Portland cement used came from Ehingen Blaubeuren, and was of a fineness to pass a 5,800-mesh sieve.

* * *

FIRE-STATION, BARKING.

THIS building forms one of the group of buildings recently erected by the Barking Town Local Board, and referred to in our issue of October 19th. The accommodation is for two engines, hose-cart, &c., an office for the use of the captain, with suitable residence on the first floor for a resident fireman. The hose-tower shown in the drawing is fitted inside the lantern-roof with gearing for hoisting the fire-hose. The walls of ground floor are faced internally with salt glazed bricks; the external walls are faced with pressed red bricks, and relieved with Monk's Park stone, the roof being covered with Broseley plain tiles. In the rear of the building are a spacious paved yard, and stabling for two horses. The contractors are Messrs. Kirk and Randall, of Woolwich, and the architect Mr. C. J. Dawson, F.R.I.B.A., surveyor to the local board.

* * *

At the quarterly meeting of the Hants county council it was reported that good progress was being made by the contractors with the county offices at Winchester. Mr. Robinson is the architect, and Sir Arthur W. Blomfield, A.R.A., the consulting architect.

The Duchess of Teck opened, on Saturday, the building erected at Bethnal Green for the Oxford House Club, from designs by Mr. Hale. A lecture and entertainment hall is on the ground floor, while above are a library and *café*. On the second floor is the billiard-room, in which are three tables and three bagatelle boards, while the top floor is divided into committee and classrooms and a card-room.

WAYSIDE NOTES.

One's patience is taxed by the vagaries brought together and described as "Modern Pictures" by the New English Art Club. Their thirteenth show has just been opened in the Dudley Gallery; but it is for the most part a very tame and tasteless affair, devoid of humour, and characterless as a whole from an art point of view, though I am quite well able to see an amount of tricky cleverness in many queer things there, and real merit in a very few others. I am not surprised to note how the exhibition is becoming impoverished and lacking in skilled productions, for the cult of the whole thing is unhealthy and unnatural, with no manliness or honesty of purpose about it. Here and there a true piece of artistic work creeps in, and shines in merit midst the follies with which the room is garnished in its ghastly gasconade, loudly calling for notice in bedaubed vulgarity, displaying often, and by preference, the most commonplace of subjects. Mr. Will Rothenstein sends two large frames of this kind. His "Porphyria" (price £95) shows a fully-developed female wearing the ugly costume of the early Victorian period, with a low bodice to display amply the Dutch-like ideal of beauty, in a white frock, well beflowered, and trimmed with magenta pink, seated on a red-and-white striped sofa. His next exhibit shows two "Coster Girls" (£40) by the river-side, brutal in their realism, but not badly painted in an unsavoury manner, besmirched with the rough morality of the doss-house. Cast in the same low type of unwholesome association is Mr. W. Sickert's crude, inarticulate rendering of a serio-comic "turn," with limelight glare, at "Sam Collins's," Islington (£52), made more racy by colour daubed on to the frame. It is impossible to conceive anyone desiring to possess such a production. The same exhibitor's "l'Hotel Royal," Dieppe, is another unaccountably ugly subject, knocked off in the paint-pot style, and called "impressionism."

The best picture in the gallery, to my mind, is Mr. Wilson Steer's "Japanese Gown," in which a tall, graceful female—not, it is true, remarkable for beauty—stands in front of a cheval glass admiring her Oriental mauve dress, richly brocaded and splashed with patternings of black and red. The heavy tresses of her abundant hair partly shade the lady's face as she turns in graceful attitude, bespeaking movement, and exhibiting an ease of handling on the part of the painter which has secured a brilliant effect without needless effort. The big canvas by M. Paul Helleu, showing "La Fontaine de Latone, Versailles," at the end of the room, is singularly ineffective, and hardly realises, in its all-over drenching of paint, any idea of water in action. The picture exhibits an entire absence of concentration, and shows, too, a lack of knowledge of architecture. "Jenkins, fruiterer," is the name of a gas-lighted street view, probably in Hammersmith Broadway, by Mr. Francis Forster, which is in every way a direct contrast to the last-named picture. The subject is ugly enough; but as a true impression, brilliant in its luminosity and concentrated in intention, the exhibit deserves warm praise. Mr. C. W. Furse aims at daylight effect in his able portrait of "Lord Monteagle," but the result is elementary and ungainly, and the same remark applies to "Mrs. Walter Sickert," painted by Mr. J. E. Blanche; but then some people seem to be nothing if they are not queer, as if that could be the chief object of life. Cromer, always a favourite subject, makes a gay evening study by Mr. J. L. Henry, red in sunset glow, with the church tower tapering off in yellow. Mr. R. Anning Bell sends a coloured terracotta in red called "Helena of London"; and also in a frame are some clever enamels by Edith and Nelson Dawson set in *repoussé* metal frames, oddly designed and jewel-like in colour. Mr. E. Friant's drawing of Mr. Will Rothenstein is an honest piece of work, and I daresay a good portrait; and near it hangs a capital still-life study in red of a table with vases, by Miss Florence Ayling. Mr. W. Estall's pastel of an old horse (87) merits praise; but I do not like Mr. C. E. Holloway's widened river scene called "Cheyne Walk"—the details seem so untrue. "Six-o'clock Tea," by Mr. A. J. Finberg, shows a very plain person in a garden on a summer's afternoon, and another odd single figure is "Mr. W. Llewellyn Hacon," painted on a pier by Mr. Will Rothenstein, and making his subject a regular guy.

The disappearance of Claridge's hotel is about to be followed by that of another famous old London inn, the White Horse, in Fetter-lane, which is also going the way of all earthly things. If the reputation of Claridge's was connected with the 19th century, that of the famous Fetter-lane inn is identified with the 18th. It was the house of great men, too, in its palmy days, but these were long ago; and it has come down to such an extent that the wanderer in search of a night's lodging could get accommodated in one of its many bedrooms for sixpence. Yet, when John Scott, who afterwards became known in political and legal history as Lord Eldon, first visited London, he put up at this antique hostelry. It retained its standing till the close of the coaching days, which railways have brought to an end. From being a hostelry where nearly a score of coaches departed or arrived daily, with country squires, parsons, and people of all degrees, it has subsided into a very humble eating-house, where the hungry may be fed at a cheap rate.

The public are keeping very shy of all investments in houses or in land, and week after week in London, nothing almost is recorded in the estate market but the putting up of property for sale, and its failing to find purchasers. Out of a dozen properties exposed for sale one day last week only one house in London was sold. It is not the Budget only which may have contributed to this result, nor even the policy of the County Council. The chief cause is more likely to be the apprehension that the political drift of the times will throw more and more largely on such investments a share of the growing public burdens; but taking all three causes into consideration, it would seem to be felt that there are better outlets for capital than are presented by either houses or land.

Mrs. Lea Merritt's recent letter in the daily papers describing the wall paintings on Keim's process she has lately carried out in a mission church at Blackheath, Surrey, has given rise to a long correspondence on the general subject of frescoes. Professor W. B. Richmond, A.R.A., writes that the process for wall painting adopted by Mrs. Merritt is in no sense "fresco." Fresco painting strictly means that pigments mixed with water are laid into a fresh wet ground composed of slaked lime mixed with river sand or marble dust. The white pigment used in fresco is lime. All colours used in fresco should, if properly applied, become incorporated with their ground. They are protected and held together by crystals which, as the lime sets, form around them. There is no other fixing body in fresco than lime. The Keim process is wholly different from beginning to end. The durability of all wall painting, in whatever medium executed, whether it be size, egg, or even oil, depends upon the absolute dryness of the wall upon which the ground for painting is applied. Professor Richmond adds:—"If architects will give us dry walls, so constructed that damp neither rises, falls, nor penetrates, we can make use again of all the ancient methods of wall painting with perfect security. If science will give us pure air in London those methods can be used there. Until that is accomplished we must content ourselves with using our perfectly permanent processes in the country, away from acid-laden skies."

A recent case, reported elsewhere, in which Mr. Gundry, a district surveyor for Paddington, recovered full fees for surveying a dangerous cornice to a terrace of houses, has led to a correspondence in one of the daily papers on the high fees exacted by these officials for repairs. A firm of contractors gives an instance where £2 12s. was charged for repairs costing £5, which were carried out without delay, and in another case the fees for pointing a chimney stack in a Norwood house came to 32s. 9d., equalling the builder's charges. In both these cases the bill was accompanied by a notice stating that, if not paid within seven days, a summons would be taken out under the Metropolitan Buildings Act. It was such cases as these that helped to raise the storm of discontent that five years ago swept away the old Metropolitan Board of Works.

Mr. William Duncan, solicitor, of 50, Constitution-street, Leith, sends me a small contrivance he has patented which is designed to overcome the great objection to the incandescent gas-light —viz., the frequent breakage of the mantle when the chimney is removed or replaced. As I know from experience, the mantle is very delicate, so much so, that I had to abandon the use of the light in my own office, and it very often happens that, as the funnel is being removed before cleaning, and replaced after cleaning, it touches the mantle and breaks it to pieces. As each mantle costs 1s. 3d., and the funnels require cleaning every fortnight, the cost of the light soon mounts up, especially where several burners are in use. Mr. William Duncan claims that his guard absolutely prevents the breakage, and as it is only used when the funnel requires cleaning, and is detachable, one is sufficient for any number of burners. The guard costs 1s., and the wholesale agent is Mr. Thomas Ferguson, 17, West Maitland-street, Edinburgh.

OBITUARY.

Mr. James Keys Wilson, of Cincinnati, one of the oldest Fellows of the American Institute of Architects, died a fortnight since, aged 66 years. Mr. Wilson was born in Cincinnati, and from 1855 to 1875 designed a very large number of buildings there, among them being the Sinton Building, the Shoenberger Mansion, the Jewish Synagogue on Eighth-street, the Mitchel Building, and many other business structures and private houses. He was the first President of the Cincinnati Chapter of the Institute, and, a few years ago, was one of the most prominent candidates for the appointment of supervising architect of the U.S.A. Treasury Department.

The death has occurred, with some suddenness, at the age of 46, of Mr. Hugh Mackintosh, a well-known builder in Edinburgh. He had been ailing for some time, but the end came unexpectedly on Saturday morning, some twelve hours after his re-election for the third time as a member of the Edinburgh Dean of Guild Court. A native of Nairn, he migrated to Edinburgh about 25 years ago, and in a comparatively short time, by his enterprise and energy, reared a successful business. It was to him and to his partner, Mr. Galloway, that the public were indebted for the opening up of the Warrender Park district in that city. He was likewise concerned in the erection of many large public buildings in the city. The school board schools at Warrender Park, Lothian-road, South Bridge, and Abbeyhill were erected by him, as were also the offices of the St. Cuthbert's parochial board in Castle-terrace; and at the time of his death he was engaged in the building of the Sick Children's Hospital. He was a very active member of the Dean of Guild Court, where his practical knowledge gave his services a special value. He was unmarried.

CHIPS.

Mrs. Lancaster, wife of Mr. C. H. Lancaster, architect and surveyor, Liverpool, died on Tuesday while under an anæsthetic in that city at a dentist's.

At the annual meeting of the dock commissioners for Leith, held on Friday, it was reported that the value of the work done at the new dock works by the contractor, Mr. John Best, was £18,330.

The new premises of the Scottish Arts Club, at 24, Rutland-square, Edinburgh, built from designs by Mr. Dunn, were formally opened on Friday afternoon by Mr. Hall Caine. The proceedings took the form of a reception by the president (Sir George Reid, P.R.S.A.) and the council of the club.

On Wednesday week Mr. Thomas Codrington, M.Inst.C.E., inspector under the Local Government Board, held an inquiry at the Guildhall, Rochester, as to the application of the Corporation to the Local Government Board for sanction to borrow £3,250 for the carrying out of works of storm-water drainage of Strood and Rochester.

During the erection of an organ chamber adjoining the south aisle of the parish church of Harrow-on-the-Hill, a work in process under Mr. J. Oldrid Scott, F.S.A., a series of Early English lancet windows, which formed the original lights to the chancel on that side, have been disclosed. They were single lights, each having an interior breadth of about 5ft. from jamb to jamb, the breadth of the light itself being about 18in. or 20in. The splays, which are deep, were from the first covered with plaster, and were decorated in colour; some of this decoration is still to be seen. The height of the spring of the arch above the sill is about 12ft. 6in., and that of the apex of the arch about 15ft. Considerable remains, sufficient for complete restoration, have been found of three of the windows, and there were probably two more. An Early English window has also been discovered in the east wall of the south transept.

Building Intelligence.

Dunfermline.—The memorial stone of St. Margaret's Roman Catholic Church, now in course of erection in Holyrood-place, Dunfermline, will be laid to-day (Friday). The church is from plans by Dr. Rowand Anderson, of Edinburgh. The plan is cruciform, with apsidal east end, the greatest length being 194ft. and the extreme breadth at the transepts 75ft. The nave has five bays, with two aisles, and the choir has three bays, two of which open into side chapels. The tower at the transept crossing is finished internally with a dome. The entrance south porch, 24ft.sq. internally, is finished with a groined roof. It is intended to decorate the apse and the dome of the transept with mosaics, and in the apse and transepts the floors will be laid with marble and tiles. Immediately below the dome will be the baldacchino. Over the entrance to the nave will be the singers, and provision is made for an organ over the east chapel in the choir. The exterior shows a building of the Transitional style of the 12th century, built with natural-faced rubble. The nave will have a series of five circular-headed windows in the clerestory, alternating with buttresses of hewn stone, corresponding with the interior bays. The square tower at the transept crossing, 108ft. high, has two double round-headed windows on each face. The porch shows an open doorway flanked by turretted angle buttresses. Entered from the porch on the west side is a circular bell-tower. It fills the recess between the nave and the porch, has a diameter of 28ft., tapering slightly to the top, and is 174ft. high. The lower stage is a baptistery. Above this, for 105ft., the main body of the tower is plain, and the upper part, which is arcaded in two stages supported on a band of sculptured figures, is open. The tower is finished with a conical stone roof. Only the nave is being built; but the total cost, when the building is finished, will be £30,000.

Edinburgh.—The new Craig House Insane Asylum was opened last week by the Duke and Duchess of Buccleugh. The mansion and estate were bought in 1878, and the new building was begun five years ago; the grounds cover 61 acres, and adjoin the 50 acres of land surrounding the West Asylum. The building is French Renaissance in style, and has been erected from designs by Messrs. Sydney Mitchell and Wilson, of Edinburgh. It represents the eastern half of the complete scheme, and contains 75 beds. The asylum building extends east and west for a distance of 360ft., and from north to south, through the central block, 250ft. The ground plan shows a building of the "—E" form, the open face being towards the south. The chief entrance is placed in the north-east angle. The great hall in the central block is 63ft. by 33ft. 6in., and 45ft. high to the crown of its vaulted ceiling. It is panelled in oak to a height of 12ft., the walls above being divided by pilasters into six vaulted bays. Artificially the hall, as well as all the rest of the building, is lighted with electric light. On the south side are two large rooms, a drawing-room, 40ft. by 22ft., and 15ft. high, and a billiard-room, 30ft. by 22ft. The dining-rooms, five in number, and situated on the north side of the great hall, vary in size from 28ft. by 20ft. to 30ft. by 35ft. Below the dining-halls is a suite of kitchens, sculleries, and other offices. Further down the northern slope of the hill is a building for the engines and dynamos, and at a lower level are six steam boilers for supplying steam and hot water. The main building is divided into ten separate sections by stone walls carried through the roofs in order to prevent the spread of fire. Three detached villas and two hospitals have been erected as adjuncts to the main building. The accepted tenders for the asylum amounted to £65,494 6s. 5d., exclusive of furnishing and other accessories, which will run up the ultimate cost to £110,000. The contractor for the whole masonry and carpentry work was Mr. John Lownie, builder, Edinburgh. The clerk of works was Mr. Perry, and Mr. Bryson was consulting electrical engineer.

Glasgow.—A new sanitary washhouse and disinfecting station for the northern district of Glasgow was opened last week by Lord Provost Bell. They are erected in the Scottish Baronial style of architecture, of red sandstone, and have a frontage of over 200ft., standing 30ft. from the public road. The works have been designed and erected under the superintendence of Mr. Peter Fife, sanitary inspector for the city.

Morley, near Leeds.—The top stone of the tower of the new town-hall was laid on Friday, Nov. 9th. The stonework of the tower is about 120ft., and the dome, turret, and terminal will be 30ft., making a total of 150ft. It is expected that the huge building, which includes town hall, municipal buildings, borough court, police department, cells, and electric station, will be opened the early part of next summer. The architects are Messrs. Holtom and Fox, of Dewsbury. Mr. Henry Clarke is the clerk of works, and Mr. William Bines contractor's manager.

Stratford-on-Avon.—The new infectious diseases hospital in the Birmingham-road was opened on the 8th inst. It consists of five separate blocks. These are an administrative block, suite of offices, embracing disinfector, washing-house, laundry, mortuary, and discharging rooms; scarlet-fever pavilion block, diphtheria block, and typhoid, quarantine, or private patients' block. These blocks occupy three sides of a quadrilateral, all isolated and separated by a 40ft. zone from the boundary fence. The scarlet-fever wards contain 156sup.ft. of floor space, and 2,028c.ft. per patient. The other ward blocks contain 216sup.ft. and 2,700c.ft. per patient. In each ward is a double Shorland's Manchester warm-air grate. The walls are built hollow, and are plastered internally with adamantine cement plaster, finished with distemper. The floors are of narrow boarded pitch-pine, waxed and polished. The hot-water is generated by gas boilers of the multitubular description, placed in the passages. Mr. H. A. Campbell, the borough surveyor, was the architect, and Mr. Whateley the builder. The total cost has been £5,640.

CHIPS.

The Council of the Property Protection Society, in their fourth annual report, state that the Society had continued to make satisfactory progress, and that its efforts for the protection of proprietary rights have been maintained and extended. Among the public Bills opposed by the Society during last session were the Industrial and Provident Societies Bill, the Land Values Bill, the Leaseholders Bill, the Occupying Tenants Enfranchisement Bill, the Places of Worship Bill, the Smaller Dwellings (Scotland) Bill, and the Workmen's Houses Tenure Bill.

The foundation-stones of a new church in Davies-street, Oxford-street, to be called the Church of St. Anselm, and designed to take the place of the Hanover Chapel, Regent-street, were laid last week by the Duke and Duchess of Westminster. The former has given the site for the church and vicarage, and the building, to cost £20,000, is to seat 800 people. To provide the funds, Hanover Chapel, one of Professor Cockerell's best works, is to be sold and demolished, under a private Act passed last year.

The magistrates at Stratford last week, in compliance with an application by the Tottenham and Forest Gate Railway Company, appointed Mr. Alfred Savill, of Kingwell, as valuer for a small piece of land in Suffolk Park-road, Walthamstow. The railway company have taken possession of the land, for which no owner has been found. Its value will be deposited in a bank, to await events.

Extensive alterations have just been completed for a firm of drapers in Wine-street, Bristol, the shop having been extended to a frontage in St. Mary-le-Port-street, a total depth of 175ft. Mr. Herbert J. Jones, M.S.A., Bridge-street, Bristol, was the architect, and Mr. T. R. Wilkins, of the same city, the contractor.

At the Bristol Docks extension at Avonmouth a new hydraulic crane has just been erected. It has been supplied by Sir W. G. Armstrong, Mitchell, and Co., of Newcastle, and is capable of coaling a vessel at the rate of from 250 to 300 tons per hour. The crane is movable, running along rails placed parallel to the edge of the dock. The base is arched, and rails are laid between, so that a train can run along underneath. Besides being available for coaling purposes, the crane can be used for lifting any load up to 30 tons in weight. The cost was £4,700. The crane is 69ft. above the coping of the dock wall to centre of jib head, and weighs 160 tons.

The large block of buildings forming the Bishopsgate Institute, situate in Bishopsgate-street Without and Brushfield-street, will be opened by the Earl of Rosebery on Saturday in next week, the 24th inst. The buildings, which comprise a hall, library, and reading-rooms, have been erected at a cost, including the site, of about £70,000. The hall will seat 500 persons. Mr. C. Harrison Townsend, F.R.I.B.A., is the architect, and the contract was taken in May, 1893, by Mr. J. T. Chappell.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Leeds and Yorkshire Architectural Society.—The first ordinary meeting of the session of this society took place on Monday evening at the Mechanics' Institute, Cookridge-street. The president, Mr. E. J. Dodgshun, F.R.I.B.A., delivered the opening address. The number of members on the roll was, he said, the same as last session. Strength lay in unity. Could they truthfully say they were honestly united in the wish for the welfare of the profession, or were they more anxious about individual success as business men? If not the latter, why was it that so comparatively few of the architects in the district were attached to that society? The only reason he could give was that they were not sufficiently interested to join. If they were united, their endeavours would have more weight, and they would most undeniably advance their interests. He next referred to the building by-laws committee of the corporation, and their methods of passing plans. It was positively degrading to be supervised by a set of men—the sub-inspectors—who could not possibly have the experience they, as architects, were supposed to possess, and to have to explain to such how they proposed to carry a wall, ventilate a room, or lay a drain. Why should there exist a building by-laws committee at all? Would it not be preferable to dispense with the committee, and appoint district surveyors, whose duty it should be to see that the laws were not violated or infringed? The president said he thought the city engineer went beyond what should be required of him when he undertook the designing of buildings of an architectural character, such as lodges, park gates, laying-out parks, and so forth. The city engineer had quite enough to do in his own legitimate line, without being expected to make designs for architectural works, and it would be to the city's advantage to appoint an architect for work of that description. The new fish-market was ample proof of what he had stated.

Sheffield Society of Architects and Surveyors.—The ordinary monthly meeting of the members of this society was held on Tuesday evening, when there was a good attendance of members. The chair was occupied by Mr. E. M. Gibbs, the President, who delivered an address on the recent events connected with the profession in the city. Mr. Hugh Stannus gave a lecture on "The Three Greek Orders: Doric, Ionic, and Corinthian." It was announced that Professor Anderson had promised to give the concluding lecture of the session in March, which fills up the list.

The Surveyors' Institution: Junior Meetings.—The council have awarded the prize offered by Mr. T. Chatfeild Clarke (the president) to Mr. Harold Castle, for his paper entitled "French Light on the English Land Question." The fellowing papers are honourably mentioned:—"Fen Farming in 1894," by Mr. S. Stevens, and "Ventilation," by Mr. E. W. Hooper. The dates of the four meetings as fixed by the council for the session are:—1. Monday next, the 19th inst., at 7 p.m. Paper entitled "French Light on the English Land Question," by Mr. Harold Castle. 2. 14th Jan., 1895, "Fen Farming in 1894," by Mr. S. Stevens. 3. 11th March, "Ventilation," by Mr. E. W. Hooper. 4. 6th May, "Realisation of Landed Estates," by Mr. J. W. Tyler.

At the National Schools, Esholt, Mr. George Waller Wilcocks, M.Inst.C.E., one of the Local Government Board's Inspectors, held an inquiry, on Tuesday, into the application of the Wharfedale rural sanitary authority for sanction to borrow £2,500 for works of sewerage and sewage-disposal for the township of Esholt.

Yesterday (Thursday) the Bishop of Durham dedicated the new portion of the Church of Holy Trinity, Gateshead. Originally the chapel for the Hospital of St. Edmund, Bishop and Confessor, it was rebuilt in 1244. After the surrender to the king's commissioners in 1540, the chapel was allowed to fall into disuse, and was never again used for religious services until restored by Cuthbert Ellison in 1837. The recent additions include a new nave and aisle, erected on the site of a school which adjoined, and which has been rebuilt at the east end of the church. The cost of the work has been £5,100, the architect being Mr. Stephen Piper, M.S.A., of Westgate-road, Newcastle-on-Tyne; the contractors Messrs. Anderson and Slater, of Newcastle. Mr. Richley was the clerk of works. Among the special gifts are a stained-glass window, pulpit, brass lectern, choir stalls, &c.

COMPETITIONS.

Bury, Lancs.—In a limited competition for a new chapel and school to be erected in Walmersley-road, Bury, for the United Methodist Free Churches, the designs of Mr. Geo. E. Bolshaw, of Lord-street, Southport, and Victoria-street, Crewe, have been selected, and he has been instructed to carry out the work.

Kilkenny.—In the recent competition for a new Town-hall for Kilkenny, the design of Mr. J. Kelly Freeman, M.R.I.A.I., Sun Chambers, Trinity-street, Dublin, has been selected.

Morley.—For the new board schools to be erected in High-street, Messrs. Holtom and Fox, Dewsbury, are the architects selected by the board, out of 24 competitors from different parts of the country, to carry out the above.

CHIPS.

The town clerk of Bath on Tuesday received a letter from the Local Government Board authorising the raising of a loan of £30,000 for the pump-room annexe.

At Bridge-street Independent Chapel, Walsall, on Tuesday, memorial stones were laid of a new front which is to be put to the old building, erected in 1791. The plans have been prepared by Mr. McConnall, of the firm of Messrs. Bailey and McConnall, and embrace the renovation of the roof; a new front, which will be brought forward 8ft.; three front doors, with extra side doors for the galleries; a large vestibule, and extra seating accommodation in the gallery. The tender of Mr. W. Kendrick, Walsall, has been accepted for the works at £1,800.

The report of the Blackpool Tower Company on the first year's operations has exceeded the most sanguine expectations. The net receipts for the last eleven months are £12,389 14s. 9d., and of this £5,940 7s. 11d. is available as balance. Dividends are declared of 6 per cent. on preferred ordinary shares, and 4 per cent. on the ordinary shares, and £500 is set aside for the reserve fund.

Mr. George Fosbery Lyster, of Liverpool, and of Plas Issa, Llangyntrafel, Ruthin, is amongst the gentlemen named for appointment as High Sheriff of Denbighshire. He has long been the engineer of the Mersey Docks and Harbour Board.

Mr. Thomas Fenwick Hedley, a well-known rating arbitrator and valuer, died at his residence, 12, Park-place, Sunderland, on Tuesday, aged 73 years. Mr. Hedley's great familiarity with the law and practice of rating led to many demands for his services by unions and parishes throughout the country, and the High Courts referred to him many cases for arbitration. This work led him to devote himself to valuation and arbitration. In this business some of his sons joined him.

The opening meeting of the winter session of the Northern Architectural Association was held at the Art Gallery, Newcastle-on-Tyne, on Wednesday evening, when the president (Mr. Jos. Oswald, F.R.I.B.A.) delivered his inaugural address.

The ceremony of laying the memorial stone of a new wing to St. Clare's (R.C.) girls' orphanage at Pantasaph was performed on Monday, in the presence of the Bishop, the Right Rev. Dr. Knight. The addition will involve an outlay of over £2,000. The contractor is Mr. W. Henley, of Salford.

The foundation-stone of a new church of All Hallows has been laid at Higher Kew, Cornwall, by Lady Falmouth. The old church, built ninety years ago, was so poorly constructed and ugly that it has been demolished, and will be replaced by one designed by Mr. G. H. Fellowes Prynne, and Perpendicular in style. It will consist of a nave 170ft. by 21ft. 8in., a chancel 30ft. 6in. deep and 21ft. 8in. wide, two vestries, porch, and tower surmounted by copper-covered spire. The church will seat 380 people, and will cost £4,600. Mr. A. Carkeek is the builder.

The Mersey Docks and Harbour Board have approved of a recommendation of the Docks and Quays Committee to establish lairages and to build a floating landing-stage at Seacombe for the accommodation of foreign cattle at an expenditure of £400,000.

The reopening, after restoration, of the parish church of Ravenfield, near Rotherham, took place on Friday. The old, straight-backed pews have been replaced by open benches; carved oak choir-stalls have been provided, and a new carved oak lectern and reredos added. In the latter has been placed an old painting representing the Annunciation, formerly in the roof of the chancel.

Colonel Hasted, R.E., an inspector of the Local Government Board, held an inquiry at Taunton on Tuesday, in reference to an application from the town council for permission to borrow £5,000 for the purpose of electric light extension.

Correspondence.

THE SOCIETY OF ARCHITECTS' EXAMINATION.

To the Editor of the Building News.

Sir,—I am afraid, from his letter in your last issue, that Mr. W. H. Seth-Smith must have entirely misconstrned the intention of the examination which the Society of Architects has now decided to institute as antecedent to membership, to come into force in November, 1896; and it is the more strange that he should ventilate his misconstruction in the public Press, as, being a Past President, and therefore having a seat on the Council, he need only have attended the Council meetings when the matter was under discussion, to have made himself conversant with every aspect of it.

It goes without saying that no professional body of architects can claim that its entrance examinations, imposed in self-defence, to keep the unworthy out of its own ranks, shall be "regarded as constituting a test of qualification to practise architecture," so long as it has not the right to prohibit practice to those who have not passed such examinations. Such right can only be obtained by Act of Parliament. The well-known Registration Bill would, if passed, secure this to the Institute which has consistently opposed it, and leave in the cold the Society which has as consistently supported it. For years the Institute has been in a logically false position in opposing the Bill and at the same time examining for its own Associateship, and the Society has been equally illogically placed in supporting the Bill and admitting to membership without examination. This false position the Society now escapes from.

Further than this, it has been announced very definitely that when the Registration Bill passes into law, as it must do sooner or later, and may do at almost any time, the Institute will refuse to take the position of examining body accorded to it, whether from pique, or as a last endeavour to wreck the working of the measure, is not stated. Of course, such an eventuality is carefully provided for; but it will then certainly expedite and simplify matters, if, when this happens, there be another examining body in existence ready to take up the work. It will be two years yet before this will be the case, and if the Bill should happen to pass into law meanwhile, I shall look upon it as a very bad thing for the Society, and shall in so far regret it, anxious as I am that this much-needed measure should be pushed through.

The Society is, therefore, acting entirely in self-defence to raise the standard of its membership, and to avoid extinction on the passing of the Registration Bill. For two years yet, membership can be obtained by nomination and the production of photographs and drawings of satisfactorily executed works; but at the end of that time a closer barrier will be set up, in accordance with the resolution passed at the recent annual meeting.—I am, &c., G. A. T. Middleton.

THE SOCIETY OF ARCHITECTS.

Sir,—I did not have the pleasure of listening to the presidential address of Mr. Hamilton last evening; but I was delighted to see in the report which appeared in the *Times* this morning the following words:—"He (the President) urged the limitation of architectural practice as much as possible to what was certainly the main province of the architect—*the designing and superintending the erection of buildings*."

Let the Society of Architects follow up, in every possible way, the excellent advice of its President. Let them educate the public to understand that its interests can only be thoroughly protected when the real functions of the architect are brought into play, and that to surrender all questions of construction, materials, superintendence, and sanitation to others, whilst the so-called *architect* is devoting himself to carved brickwork, gauky roofs, floors at different levels, dark rooms and passages, broken pediments, burlesqued columns, chairs and tables, table-covers, and window curtains, is to surrender the distinct and best interests of the client, and the Society of Architects will very soon make it apparent that a young and vigorous body is a better guardian of the public interests than the Mutual Admiration Society at 9, Conduit-street. Let the Society tackle the *cant* which is the stock-in-trade of the half-dozen outsiders who cover their professional ignorance by the query, "Is architecture a profession or an art?" Let it teach "Art Standing Committees" that the designing and superintending the erection of buildings—within the full meaning of the comprehensive phrase—is the true work of the architect, and it will not be difficult to expose the shallow perversions of the falsely so-called "art architect."

That *architecture* is degenerating is not open to question. Whilst we are deluged with rubbishy talk about "art," we are treated to its degradation; whilst we are obliged to listen to the cant about "due regard for the works of others," we see it disregarded by the very set who utter the platitudes; and at the moment when "examining bodies" are insisting upon "true principles" their own members are murdering them. The Society of Architects has a free hand, and it is within its power, if it so wills, to open up a new era of truth in architecture.

And whilst, Sir, I am on the subject of the Society of Architects, may I be permitted to express the hope that, as regards its recent discussion on the question of *examination*, it will proceed to act entirely in its own independent capacity. It need not look at No. 9, Conduit-street at all—it will receive nothing but opposition from that quarter—and if examination is good, then go for the good, and go alone.—I am, &c.,

Wm. Woodward.

13, Southampton-street, Strand, Nov. 14.

STAINED GLASS.

Sir,—My attention has been called to a paper in the Building News of last week, wherein Mr. Herbert Bacon has taken upon himself to make statements the reverse of accurate with regard to myself.

Mr. Bacon should be obliged to me for being the instrument of his long and self-advertising article.

I have neither time nor desire to criticise that article, and I only wish to reply to Mr. Bacon's hasty mis-statements. He says: "Mr. Richmond does not execute his windows with his own fingers." "He employs glass-painters and mosaicists whose names the public never knows." Both these statements are untrue.

In answer to the first, allow me to state that the drawings and designs for all my windows were executed to 1in. scale, completely finished, down to the most minute lead, by me. That every square of glass was selected and chosen by me in my studio. That the working full-sized cartoons were drawn under my eye in my studio, and that all the figures were entirely wrought by my own hand. That I spent many days and, in all, several weeks, not only in teaching Mr. Powell's glass-painters what my desires were, but also in painting upon the glass myself. Indeed, there was not a single compartment left without my handywork upon the glass, correcting and executing all the more important parts—heads, hands, drapery, &c.—with my own hand.

I venture to remark that had Mr. Bacon given one quarter the time that I have given to my windows upon his, he would not have been able in three years to have turned out 410 windows.

Would he spend three weeks of his time in lining a window with double glass, seeing each piece cut and put in place, six and seven hours a day? I doubt it. No commercial firm would.

Mr. Bacon and his companions may be admirable artists—I hope they are. However, they should, before they accuse an artist of "cant," verify their assertions.

Mr. Bacon could have paid a visit to Messrs. Powell's, where he would have learned the truth in relation to my work.

In answer to his second assertion, as untrue as the first. The name of every individual who has worked with, and under, me at St. Paul's has been inscribed in the archives of that cathedral. Mr. Bacon will be able to read and learn, if he applies for permission at the Cathedral to do so.—I am, &c., W. B. Richmond.

Sir,—As a lover of fine arts, and an old friend of Mr. W. B. Richmond, I have read with great indignation the utterly unfounded and gratuitous libel upon that gentleman, published in the report (in your last number) of a lecture delivered by Mr. Herbert Bacon at Manchester. Referring to the new windows in the choir of St. Paul's, Mr. Bacon volunteers the statement (for which he can have no possible authority) that Mr. Richmond does not execute them with his own fingers, but employs a firm to do them.

It is, of course, obviously impossible that the artist who designs monumental work of any kind can do the whole of the work himself, no matter whether he be architect, sculptor, or painter. Does Mr. Bacon imagine that Phidias sculptured with his own hands all the figures on the pediment of the Parthenon? Of course, he knows better, and the gist of his charge against Mr. Richmond, therefore, is that the artist has been satisfied with preparing drawings or cartoons for stained-glass windows and mosaics, and has handed over the execution of them to a firm of tradesmen who employ unknown artisans to carry out the work. Nothing could be further from the fact than this misrepresentation. Mr. Richmond has given a minute personal superintendence to the work throughout, and has himself drawn largely upon the glass for the windows. Not only have I seen this with my own eyes, but I have witnessed the extreme care with which he has personally selected the exact colours of the glass to be painted upon.

It will doubtless be news to Mr. Bacon that out of the 20 men now working on the mosaics in St. Paul's only two had ever handled a tessera until they began to work under Mr. Richmond. Mr. Bacon is probably equally unaware of the fact that Mr. Richmond trained all the mosaic workers himself in the special studios he has built at Hammersmith, and that he devoted in all no less than four months to this preliminary training. Some distinguished artists have probably furnished designs for mosaic, without giving any profound attention to the technique of mosaic work; but certainly Mr. Richmond is open to no such charge. He has revolutionised the method of execution followed by modern mosaic workers generally, after giving the most patient and prolonged study, not only to the finest Mediæval work in Italy and Greece, but also to the optical principles which underlie the successful use of mosaics in a Southern climate. Moreover, he has worked out the many modifications of those principles requisite for the use of mosaic in a Northern climate and in a Renaissance or Gothic building.

I should be the last person to refuse a word of appreciative admiration to Messrs. Powell, the firm which furnishes the extremely beautiful glass for the mosaics at St. Paul's; but it must be remembered that admiration of the same kind (though less in degree) is due to the tradesmen who furnished the materials for the palette of a Titian or a Tintoretto; and that the *colour* (in the sense in which that word is used by artists and writers on art) is no less the creation of the designer in mosaics who works as thoroughly as Mr. Richmond does, than it is of the great masters of painting.

Mr. Bacon's advertisement of himself and the firm of architects to which he belongs may readily be pardoned, in consideration of his feeling against commercialism in matters connected with his art; but it is not easy to overlook a wanton attack upon a brother artist who is at least as much opposed, both in practice and in theory, to the purely commercial methods as ever Mr. Bacon can be.—I am, &c., Alfred Higgins.

The Burlington Fine Arts Club,
17, Savile-row, W., Nov. 13.

FIREPROOF PLASTER.

Sir,—In the Building News of November 2, a report is given of the result of trials made at Belleisle, York-road, with respect to the resistance of plaster ceilings to fire, and wherein it is stated that fire was allowed to play on a ceiling for three-quarters of an hour without any apparent damage thereto.

Allow me to state that similar experiments, made on ordinary ceilings of the same character as the one described, about a year and a half since, fully confirm the wonderful power of plastering to withstand a severe conflagration, but under more severe conditions than the one alluded to.

An ordinary ceiling on metallic lathing was constructed over a purpose-built brick room, and subjected to intense heat from burning wood for over two hours, during which time water was poured on the upper side at intervals, the result being that the ceiling remained intact. The only effect apparently was that the metallic lathing assumed a corrugated form from expansion, but the plastering appeared quite capable of conforming to this change of shape without cracking even, although, as a matter of course, every particle of hair was consumed. Wood laid on top of the ceiling was quickly alight, but a few inches above the heat was so slight that no serious damage could be sustained by any incombustible materials.

The unexpected results of these experiments undoubtedly places ordinary plastering mortar, properly applied to metalling lathing having a good key, in the first category of fire-resisting materials.

The non-conductivity of plastering when compared with burnt clay—viz., as 26 to 66—is another important advantage. Patent cements and plastering materials, the basis of which is gypsum or plaster of Paris, did not stand fire so well as common plastering mortar made in the usual way—probably the result of being much harder, and less capable of change of form without cracking and splitting up into fragments. On the other hand, the nature of the sand employed in common mortar had undoubtedly to do with the result. But no matter how much a plastered ceiling may be able to resist fire, unless the steel or iron joists are amply protected, the general result will be a failure, and this depends upon the efficient protection of the bottom flanges, which, during a conflagration, are the parts usually liable to acquire a high temperature, but in a general way are most exposed, and during a fire are called upon to sustain an increased strain.

Anyway, there can be no doubt that the best possible first line of defence is a plastered ceiling totally disconnected from the floor, and the second is to thoroughly encase and protect the metal joists, more especially the bottom flanges, upon which the stability of the floor largely depends, and the third to avoid as much metal, otherwise, as practicable, and allow it room for expansion. These conditions are embodied in a patent which I obtained about a year since, and which bears my name.

The German authorities made a number of experiments in 1893, with the view of determining the best class of floors to stand against fire, and the successful resistance of common plastering mortar to a conflagration was very marked. Our own Government are now adopting fire-resisting floors in most public buildings, but apparently with no prejudice in the matter, and no settled conviction as to the most desirable one. This is somewhat strange when it is remembered that thousands of pounds are being expended annually in this direction, while the issue at stake is very far from being unimportant. A few hundred pounds spent on an independent series of tests of the numerous systems now before the public would set at rest—for a time at least, until further developments took place—the description of floors best adapted to take the place of the time-honoured but dangerous and unsanitary wood arrangement.—I am, &c., Thomas Potter.

39, Victoria-street, Nov. 7.

A WARNING.

Sir,—A man I find is calling upon various architects and builders, representing himself to be a son of the late Gilbert Scott, and asking for assistance, though, as far as I have heard, without success. I need hardly say that he is an impostor.—I am, &c., J. Oldrid Scott.

35, Spring-gardens, London, S.W.

* * *

The rector of Flint has dedicated a new pulpit in St. Mary's Church, erected as a memorial to the late Miss Moon. The pulpit is of stone, and has been executed by Mr. Edward Griffiths, of Chester.

Reopening services in connection with the Asbury Wesleyan Memorial Church, Handsworth, which has just been enlarged by the addition of a new chancel and new classrooms, were held on Sunday. The schoolroom has been considerably enlarged, a commodious lecture-room erected, several classrooms have been added, and improvements made to the church itself.

The Mechanics' Institute in Skellgate, Ripon, founded about sixty years ago, has been rebuilt on a fresh and larger site, at the east corner of the old Market-place. There has been erected, from the designs of Mr. G. Styan, architect, York, a brick building with stone dressings, at a cost of £1,500. On the ground floor is a room, used for library and savings-bank purposes, and a schoolroom to accommodate a hundred pupils. On the first floor are a reading-room, two committee-rooms, a secretary's room, and a cloak-room. The second floor and the basement are occupied by the caretaker. Behind the building are a cookery kitchen and workshop for carpentry and other manual instruction. The formal opening took place on Friday.

Intercommunication.

QUESTIONS.

[11245.]—**Improved Cross-Staff.**—What concise book or paper is there on the right use of the improved cross-staff with revolving parts (degree marked) for surveyors?—Statutory.

[11246.]—**Lettering Marble or Stone Surfaces.**—In lettering stone or marble where it is desirable to have the letters filled in with black or red sealing-wax as more durable than painting, and if for greater permanency to have the dove-tailed grooving filled in with lead, what is the best way to bring the wax or lead to a smooth face with the stone or marble surface?—Tolop.

[11247.]—**Architect's Duty.**—Is an architect justified in providing healthy adjuncts ahead of his employer's requirements, such as special supply of fresh air and exit for foul in dwelling-houses when neither the employer or the occupants themselves care for these things?—Progressionist.

[11248.]—**Formulæ for Long Columns.**—Which is the correct formula for long columns? Hurst's Handbook gives Gordon's formula as—

$$W = \frac{36\,s}{1 + \frac{l^2}{400\,d^2}}$$

while Part IV. of "Notes on Building Construction" gives it as—

$$W = \frac{48\,s}{1 + \frac{l^2}{800\,d^2}}$$

These cannot both be correct. If some reaher will kindly say which is, he will greatly oblige one who is—Mystified.

[11249.]—**Window Tracery.**—Would some reader kindly inform me which is the best book showing the method of drawing window tracery. I have got Brandon's "Veritas."—J. W. S.

[11250.]—**Abutting Buildings.**—Has the owner of new erection built against higher adjoining building any right to insert flashing into the abutting building where the new erection is below that already built, for mutual protection against wet weather causing damp between the buildings?—Doubtful.

REPLIES.

[11236.] — **Colouring Deed Plans.** — "E. H." should, after pencilling, place a small quantity of powdered French chalk upon the parchment, and rub it in with a small ball of soft paper. Shake off surplus chalk, and ink-in with Higgins's waterproof drawing ink. Finally colour with water-colours without ox-gall. It is important that ox-gall should *not* be used in colour-washes, as it causes the parchment to shrink, and is unnecessary if the above directions are followed. Should it be desired to afterwards ink-in over coloured parts, allow same to dry thoroughly, and then finish off with a duster to prevent the ink flowing too freely.—J. E. M.

[11237.]—**Granite, Stone, and Marble.**—In reply to a letter of "J. T. P.," I think there is no work published in the locality of any stone and marble quarries throughout the world; but there is a handbook on "Marble and Marble Workers," by Arthur Lee, published by Crosby Lockwood and Son, which gives full particulars relating to the principal marble quarries in the world.—J. L. Williams.

[11239.]—**Open-Timbered Roofs.**—"H. L." states "if the roof-trusses are properly constructed, the chase is unncessary" in walling to receive wall-posts. The next question arises as to what is proper construction, as the office I was brought up in, during over the dozen years I was there, invariably had chases formed in walls to receive wall-posts, both for school and chapel structures, so as to prevent too great a weight coming solely upon the stone supporting corbels, and also preventing lateral movement between the binders while fixing same and afterwards. Perhaps "H. L." can throw some light on the subject of proper construction, and oblige.—Improver.

[11242.] — **Ventilation of Public Rooms.** — Assuming that no gas or artificial light, which fouls or heats to an unpleasantly high temperature the air of the room, be burning, and that the fresh air be warm, and the season be winter, then the best way to ventilate a room is to admit the fresh air through an opening in the wall, 8ft. from the floor, to extract it through an opening in the same wall, but at the floor level. It is assumed that there are no hot-water or steam-pipes or radiators in the room, and that the openings are connected to flues—i.e., that a system of combined warming and ventilation be in use. If gas or other air-fouling or heating light be burning, then an opening is needed in the opposite wall to that through which the air enters, and this opening must be as near the ceiling as possible, and it must have a shutter to close it, so as to prevent leakage and waste of warm air when the lights are not burning. If the room be not a square but a long one, put the openings and flues in the long wall. But if cool air be coming in, and it be desired to cool and ventilate the room as it is in summer, whether air-fouling lights be burning or not, then the outlet opening must be close under the ceiling, though the inlet may still have its lower edge 8ft. from the floor. The happiest compromise of relative positions of flues and openings is to put the inlet flue at one end of the longest wall of the room, and the outlet flue at the other end. Make the lower edge of the inlet opening 8ft. above the floor; make the top outlet opening (the summer or gas-light outlet) as near the ceiling as possible, and put a shutter in it, and let the sill of the bottom outlet opening rest on the skirting, if the skirting be not more than 15in. high.—Palatinus.

[11243.]—**Charge for Measuring Work at Completion.**—1. For an ordinary job the charge would be 2½ per cent. on the extras and 1½ per cent. on the omissions. 2. If the alterations to the building have been ordered by the employers, it is perfectly clear that the architect should be paid for the measuring at the rate of 2½ per cent., or at some less rate to be agreed with the clients, should the nature of the measuring justify the reduction. Is it quite impossible to settle the matter by measuring the variations?—Henry Lovegrove.

[11243.]—**Charge for Measuring Work at Completion.**—"Lancastrian" seems to assume that it is the rule for architects to prepare their own quantities. This is done in some small provincial offices, but never, I believe, in the best offices. (1) If 2½ per cent. has been received for quantities, only a nominal fee should be charged for measuring up the work at completion, providing, of course, that no very extensive alterations were made as the work was in progress. Three guineas would generally be sufficient for contracts not exceeding £2,000. (2) If the original contract was so altered by the employer as to necessitate the measuring up of the work in order to ascertain the amount due to the builder, then the employer is liable for an extra payment beyond the agreed percentage, and, should he object to pay this, the architect would have no alternative but to refuse to pass the builder's accounts, and then the builder would have to send in his claim direct to the employer.—Chas. W. Ball.

◆

CHIPS.

New board schools in Upton-lane, West Ham, were opened on Friday last. The schools accommodate 1,418 children—namely, ground-floor, 558 infants in classrooms; first floor, 430 girls in classrooms; second floor, 430 boys in classrooms. The playgrounds are spacious, the site occupying an area of 1¼ acres. Staircases are provided at each end of the hall. In each department separate private rooms for the head teacher and assistants are provided. There is a caretaker's residence, with cookery classroom. Mr. J. T. Newman is the architect.

At a choral celebration at Lympstone on All Saints' Day, a stained-glass window was dedicated in St. Mary's Parish Church. The artist is Mr. W. G. Taylor, of Berners-street. The subject is the Annunciation, and is treated in a novel manner, the scene being laid in the open fields in front of Nazareth.

The Filey Local Board have received the sanction of the Local Government Board to borrow £1,600 for the carrying out of sewerage works. They intend to construct a sewer which will carry the sewage well out to sea, and clear of the sands.

During the restoration of the parish church of Linlithgow, an ancient tombstone has been discovered in the interior of the building, and the inscription, which is in good preservation, bear the names of two former Provosts of the burgh. The inscription is:—"Heir lyis Jhon Forrest of Magdalane, Provost of this toun, quha deit the viii. day of March anno. 1589; as also Robert Steuart, his sonne-in-law, sometyme cornet of his Majestie's Guard, quha deit Provost of this toun the last day of October anno 1615." It has been remitted to the committee to consider as to a suitable place for the re-erection of the old stone.

The new municipal buildings presented to the borough of Burton-on-Trent last week by Lord Burton have been added to the existing premises at a cost of £17,000. Mr. R. Churchill, of Burton, was the architect, and Messrs. Thomas Lowe and Sons, of the same town, were the contractors.

A new block of buildings is to be erected in Esselmont-avenue, Aberdeen, for artisans' dwellings by the local branch of the Ancient Order of Foresters, and on Saturday the ceremony of laying the foundation-stone was performed by Baillie Mearns.

During the demolition of the north wall of the parish church of Llandrindod, a 17th-century structure erected on old foundations, a stone rudely carved in bas relief with the nude figure of a woman was found embedded in the wall.

Mr. J. P. Thomas, of Penally, has been elected by the Pembrokeshire county council as highway surveyor for the Narberth district.

A mayor's chain and badge were presented to the corporation of Eccles on the 9th inst. The badge bears the coat of arms of the borough, surrounded by Lancashire roses. The pendant and centre links are of 18-carat gold, and enamelled in heraldic colours. The rest of the chain is silver gilt, and it is suggested that each successive mayor shall add a gold link to mark his term of office, so that eventually the whole chain will be of gold. It has been executed by Messrs. T. and J. Bragg, of Birmingham.

The meetings of the Architectural Section of the Philosophical Society of Glasgow was opened by a conversazione on Monday evening in the Philosophical Institute, 207, Bath-street, Glasgow, in the upper lecture-room, which was decorated with articles connected with the building and allied trades. Among the exhibits were several working models of the new opening window, adopted by the Glasgow authorities as meeting the requirements of the Building Regulations Act, and a model of the stained-glass memorial window for Crathie Free Church, the latter having been lent by Messrs. J. and W. Guthrie. During the evening, Mr. T. L. Watson, the president, formally opened the section for the season, and a programme of songs and music was carried through.

Legal.

WHO IS THE "OWNER"?

Once more the definition of the word "owner," as given in the Metropolis Management Act of 1855, has come up again for consideration by the Court. The recent case of "Walford *v.* Hackney Board of Works" (*Times*, Nov. 5) is important, because it is of very general practical application. The question was whether a lessee who received the rent of a house from its occupier, and then paid over exactly the same rent to his lessor under his own lease, came within the definition of the word "owner" as given by that statute, was to be liable to pay the apportioned expenses of road-paving for the premises let. The amount was £110, and the facts were that Walford held the premises of one Harper, at a rent of £31 a year, while he had sublet them to Wright, the actual occupier, for the same rental. When he was summoned for the paving apportionment according to frontage, Walford argued that there had been some negotiation between Harper and Wright as to granting a lease direct, and though this had not been carried out, he was really only the agent of Harper to receive the rent from Wright and pay it over. The magistrate made the order apparently upon the ground that Walford, in the words of the Act, "the person for the time being receiving the rack rent." Then Walford brought this appeal, and the judges found a way out of the technical terms of the Act, so that they set aside the magistrate's order.

Mr. Justice Mathew laid it down that the Act intended to throw the charge for paving upon the "owner" of the premises, in the ordinary sense of that word, as meaning the person who really got the benefit of their rental value. If Walford had paid over anything less than he received, he would have been rightly held to be the party receiving the rack rental, and so liable. But he paid it all over, and obtained no benefit whatever. The learned judge also pointed out that if the magistrate's decision were to be upheld, the local authorities might easily have to claim against a mere man of straw, while the actual beneficial owner escaped. The appeal was therefore allowed, and now the Board of Works can only proceed against the lessor, who himself gets the full rent that is paid by the occupier.

Fred. Wetherfield, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

B. F. J.—Stone.—Contract.—Breach.—I do not consider that the delay on his side, and which is not provided for in the contract, gives you a good ground to rescind it. As to the payments, you appear to have taken the sums paid, and so to have waived your right to receive the full agreed instalments. I do not think you can safely refuse to complete the contract on those grounds and on the facts stated.

◆

A still further delay has occurred in the carrying out of the Cambridge memorial to the late Adam Sedgwick. Some twenty-one years have elapsed since his death, and the raising of a fund to provide a suitable memorial of the great geologist, and just when it seemed likely that the walls of the new Geological Museum would appear, it is discovered that the cost would exceed the estimate of £4,500, and so the syndicate are about to reconsider the plans.

At a meeting of the Western District Committee of the Haddingtonshire County Council, held at Haddington on Monday, a report was read from Mr. James Wilson, C.E., Edinburgh, regarding the recently tapped water supply at Gullane, in connection with which Mr. Hamilton Ogilvie, of Biel, proposes to make a generous arrangement with the board, in order that the district of Gullane may be supplied with water. The draft of the proposed agreement was submitted and was approved, and the scheme will proceed with as little delay as possible.

The opening conversazione of the Edinburgh Architectural Association was held at the Royal Institution in that city on Wednesday evening. After the reception, the president delivered a brief inaugural address, following which there was an exhibition of lantern slides, illustrating examples of the Mediæval architecture of France and Britain. An exhibition was on view of architectural drawings, sketches, prints, wood carvings, plaster modellings, wrought-iron work, &c.

LEGAL INTELLIGENCE.

Re J. Waterman.—The bankrupt, who had traded as a timber merchant at St. Benet's-place, Gracechurch-street, applied on Tuesday for his order of discharge. The Official Receiver reported that the bankrupt had contributed to his failure by gambling, and the discharge was suspended for two years.

District Surveyors' Fees.—At the Marylebone Police-court, on Friday, before Mr. Cooke, the London County Council summoned Mr. J. H. Hunter, a member of the Paddington Vestry, for £16 4s. 6d. as expenses incurred by the County Council in dealing with a number of houses in Gloucester-crescent as dangerous buildings under Section 69 of the Metropolitan Building Act. Mr. Horace Gundry, district surveyor for Paddington, gave evidence as to his having visited the premises and finding them dangerous so far as the cornices were concerned. About February 28 he made an inspection of the buildings, and found the danger removed, and he certified accordingly on March 1. The Council paid him a fee of £1 5s. in respect of each house he surveyed. Cross-examined, witness admitted that he had already received fees amounting to £16 10s. from the defendants for services in connection with surveying the work done on the premises in question; and he based his title to make the charge under a section of the Metropolitan Building Act. He had also received from the County Council a sum of £1 5s. in respect of each of the houses. How do you make out that you are entitled to be paid twice over in respect of these premises?—The fee of the Council is for surveying and reporting upon certain structures which were alleged to be dangerous, and that fee is specified in the schedule at 20s. Then after that your clients sent me notice that they were about to do these structural works on the premises, not as surveyor to the London County Council, but as district surveyor. Then you are acting in two capacities—one as district surveyor and one as Mr. Gundry?—No; one as district surveyor and the other as a competent surveyor. Continuing, the witness said that the two sets of fees he received were for two separate and distinct services. Exclusive of the cornices, the houses in themselves could not be called dangerous structures, but with the cornices as he found them they were dangerous. Mr. Bilney, for the defence, contended it was monstrous that an owner of property should be called upon to pay over £33 in fees on works which only cost £50 to carry out. His clients complied with the notice served on them without any delay. Another point, too, was, that of the eleven houses five were unoccupied, and therefore it was quite unnecessary to serve a separate notice in regard to each house. The Magistrate said he was of opinion that the fees might be very properly charged against the defendants by the County Council, and he ordered that the full claim should be paid, except a small charge for travelling expenses, which he understood the Council were willing to forego, but he could not allow any costs in the case.

What is an "Owner"?—Walford, Appellant, v. The Hackney Board of Works, Respondents.—In the Queen's Bench Division on Nov. 3, before Mr. Justice Mathew and Mr. Justice Charles, this appeal was heard, raising the question who is "owner" of premises within the Metropolis Local Management Act (c. 120), so as to be liable for a proportion of the expense of paving by the district board; and, in particular, whether a new tenant can be so liable, the occupier being his sub-tenant and he himself deriving no profit or benefit. The interpretation clause of the Act (section 250) saye that the word "owner" shall mean the person for the time being receiving the rack rent either on his own account or as agent for any other person. In 1886 one Harper let the premises to Walford for a term of years unexpired at the rent of £25 a year raised to £31. Walford occupied, and then in 1889 sublet to one Wright at the same rent of £31, and Wright took possession and paid rent to Walford, who continued to pay it to Harper. The board had paved the street, and demanded £110 from Walford as apportioned amount due from him in respect of his premises, and, on an application to the magistrate, he made an order for payment, against which Walford appealed. Mr. Bevan argued for the board in support of the order, citing "*Re* Christchurch Enclosure Act," and "Truman v. Kerslake." The appellant's counsel was not called upon. The Court decided in favour of the appellant Walford that he was not liable as "owner" of the premises. Mr. Justice Mathew, in giving judgment, said these local authorities would; if the magistrate's decision were upheld, often have put upon them a mere "man of straw" not really responsible. The charge was laid upon the "owner of the premises," and the question was—the appellant clearly not being the "owner" in the ordinary sense—whether the Court was coerced by the statute to declare that he was the "owner" as being in receipt of the "rack rent." It would be very extraordinary if he were so, he paying the whole of the rent over to another person really the "owner."

If he paid over less it might be different, for then he would be the only person in receipt of the full rack rent, but here he paid over the whole. The order of the magistrate, therefore, was wrong, and must be set aside. Mr. Justice Charles was of the same opinion. It might appear strange that if the appellant paid over less than the rent he received he would be liable, though not so as he paid over the whole; but in the one case the appellant would be the only person in receipt of the rack rent, whereas, in the present case, he was not. Order set aside. Leave to appeal refused.

An Architect's Responsibilities for Breaches of By-laws.—At Walsall, last week, Thomas Rollason, architect, 278, High-street, West Bromwich, was summoned for erecting five new houses and a shop in Princes-street, the Pleck, without putting in the necessary damp-course. The question at issue was whether the defendant was the person erecting the properties, within the meaning of the Act. The town clerk's contention was that the architect giving notice to the authority was the person erecting the building where he was superintending the erection; and that if he was not so generally, the effect of the notice which the defendant had served would make him so in this case. In support of this view particular stress was laid upon a printed note appended to the notice: "Further, I will make myself responsible for the work being carried out in accordance with the by-laws." For defendant it was maintained that he was not the person responsible under the by-laws. Being in the nature of criminal statutes, inasmuch as they imposed penalties, they must be construed strictly or literally, and the words "the person erecting the building" must be understood to mean the person actually doing the work, or someone acting as his agent. It could not mean either the owner or the architect. As soon as the defendant's attention was drawn to the fact that the damp-courses were not in, he saw the contractors, and wrote the borough surveyor, stating that he had called the attention of the contractors to the matter, and that the latter would no doubt attend to it before the buildings were completed. The magistrates, after some deliberation in private, dismissed the summons, but consented to grant a case for the consideration of the Court above, on the application of the town clerk, who said a decision on the point raised would be of great importance to the local authorities. Defendant's solicitor rejoined that it would also be of great importance to architects and builders.

Nuisance from Brick-Burning.—At the West London Police-court on Saturday, Mr. Curtis Bennett gave judgment in the case of three summonses which had been issued against Mr. Augustus Bird, Messrs. Alexander and Walter Thomas Richardson, and Mr. W. Willett, brickmakers, having fields in Wood-lane, Shepherd's Bush, for causing a nuisance in the process of brick-burning injurious to the health of the district. The summonses, which were taken out on behalf of the Kensington Vestry, though the brickfields were in the parish of Hammersmith, were heard in the early part of the year, and had been continued at intervals from that time, this being the twentieth day. A number of witnesses were called on both sides, the evidence as to the existence of a nuisance being most conflicting. Mr. Curtis Bennett, in giving judgment, said that under the Public Health Act of 1891 the vestry were compelled to take proceedings upon the receipt of a requisition signed by ten persons. The vestry had, however, the option of taking proceedings in that Court or in the High Court. As to the point whether there was a nuisance from these brickfields, it could not be doubted that a nuisance existed. Putting the question to himself, "Is the smell complained of the smell of brick-burning?" he came to the conclusion it was that, and that alone, which had been and still was the cause of the nuisance which the people of Hammersmith and Kensington had endured for twenty years. To that nuisance, one and all of the defendants had contributed. An expert witness had said a London stock brick was the only brick in the world in which ashes were incorporated with clay, and added that it was impossible for such a brick to be produced without causing an objectionable smell. The same witness had said to prevent the nuisance there were four things to be done—(1) to burn in kilns, (2) to burn small coal, (3) to use clean breeze and ashes from furnaces, and (4) clean breeze and ashes from houses. He (Mr. Bennett) thought the best practical means had not been used to prevent a nuisance, and, therefore, it was his duty to convict the defendants. He fined Bird and Willett each £50, and each of the other defendants £25, with 300 guineas costs. Ultimately, the summonses were adjourned for a fortnight for the defendants to consider whether they would give an undertaking not to burn bricks except with clean ashes and breeze. In that case the fines might be remitted.

The Legality of Rood-Lofts.—In the Consistory Court of Norwich, before Mr. Blofeld, the chancellor, an application was made in October on behalf of the vicar and churchwardens of St. John, Timberhill, in that city, for a confirmatory faculty for a chancel screen with rood-loft and gates, and also for a rood-beam, upon which were placed the figure of our Lord upon the Cross, and figures of the two Marys, St. John, and the Roman Centurion, some of which had been erected so far back as 1890 and other parts during the period when the see of Norwich was vacant. There was no opposition, but as it was the first case of the kind in the diocese, it was argued at length before the chancellor in the Beauchamp Chapel on October 12, when the chancellor reserved judgment. The chancellor gave judgment on Saturday last. A faculty to confirm the erection of the rood-loft and of the figures at present on the rood-beam, and to authorise the placing of the other figures there, was refused; but a faculty to confirm the erection of the screen without the rood-loft, and to authorise the placing of gates in the existing screen, the erection of the proposed side screens with gates in them, and the erection of the choir-stalls and screen behind them, was granted. Notice of appeal was given.

WATER SUPPLY AND SANITARY MATTERS.

Barnsley.—Special meetings are about to be held of Barnsley Town Council and ratepayers for the purpose of considering and approving application to Parliament for power to extend the waterworks of the town by the construction of a new reservoir at Hagg Brook. Mr. Chas. Hawksley, C.E., has prepared a scheme, which he estimates would cost about £146,000, for obtaining a supply of 1,800,000 gallons daily from the Little Don and the river Porter, after making full allowance for the compensation water to the Sheffield millowners and others. The borough surveyor (Mr. J. H. Taylor) has prepared a report on the scheme, in which he estimates the cost as follows:—Cost of works, £146,000; Parliamentary expenses, £10,000; interest on outlay during construction of works, £10,590; extras, £3,050; total, £170,000. The site is the same as that once chosen by Wakefield, whose attempt was defeated by Sheffield opposition; and it is expected that there will be great opposition in this case also.

Kendal.—The Corporation of Kendal having decided to augment their water supply at a cost of £30,000, a piece of land has been purchased from Lord Henry Bentinck at a cost of £4,500. Against this purchase 56 of the largest ratepayers in the borough petitioned the corporation, on the ground that Fisher Tarn was not a suitable gathering area, and contained peat. They asked for the engineer's report upon other sites, naming Longsleddale and Hullon Park. The engineer, Mr. G. F. Deacon, Westminster, has forwarded a long report, assuring the corporation that his original scheme is the cheapest and best. At a special meeting of the Kendal Corporation on Tuesday, the Fisher Tarn scheme was adopted, and the agreement between the corporation and Mr. Deacon to carry out the work was sealed.

CHIPS.

The Bishop of Beverley officiated on Wednesday week at the reopening of Ravenfield Church, near Rotherham, after restoration at a cost of £200. The whole of the old pews have been removed, and their places taken by seats of pitch pine. Carved oak choir stalls have been provided, also carved oak lectern and reredos.

Mr. Thos. Winter, builder, Durham, died at his residence, Claypath, Durham, on Sunday evening, at the age of 78. The deceased served his time under Mr. Thos. Grainger, the famous Newcastle-on-Tyne builder. He subsequently started for himself at Durham, and had executed many important contracts.

The Duke and Duchess of Devonshire, on Saturday, attended the reopening service of Baslow Church, which adjoins Chatsworth.

It is proposed to erect a pier about 2,100ft. in length at Ardeer, near Stevenston, on the Ayrshire coast, from designs by Messrs. Crouch and Hogg, C.E., Glasgow. It will be a private pier, solely for the convenience of Nobel's Explosives Company, and will be carried out into the sea a long way below water mark, so that their steamers may load at all states of the tide.

Folkton Church, in the East Riding, was reopened by the Archbishop of York, after restoration, on Monday. The cost has been about £400, exclusive of a new stained-glass east window, given in memory of the late rector, Rev. H. Blane.

The London County Council on Tuesday, in accordance with the report of a committee, rejected the proposal to acquire the Salisbury Hotel (late the Liberator building), on the Embankment, as a Municipal building, on the ground of the unsuitability of the rooms for a council-chamber, committees, and offices, and the bad approaches.

Our Office Table.

Professor A. H. Church is engaged on the "restoration" of the frescoes and other paintings in the Houses of Parliament. The two great Maclises, each 44ft. by 12ft., and representing one the "Meeting of Wellington and Blucher," and the other the "Death of Nelson," had accumulated upon them a thin disfiguring coat of sulphate of lime. This an application of sponging and syringing with distilled water has effectively removed. These pictures were executed by the process known as water-glass. Herbert's "Judgment of Daniel" has been treated with minute doses of linseed oil, and careful treatment has been given to his "Moses bringing down the Tables of the Law." Professor Church is now engaged on the pure frescoes by Dyce, which are in the Queen's Robing-room. Three of these are still so dirty that they can scarcely be seen, though they were treated by the late W. C. Cope, in the year 1868, to an application of paraffin wax.

The London Building Trades' Federation have sent a copy of the following questions to all the candidates for the London School Board:—Are you in favour of contractors supplying with each tender a schedule of the wages paid to their employées, and, where found less than the trade-union rates, that the tender not be entertained? Are you in favour of the insertion of a clause in all contracts compelling the Board's contractor to recognise the working hours of the London district? Are you opposed to contractors sub-letting any portion of work to one or a number of workmen? Are you opposed to any contractor sub-contracting any portion of his contract without the direct sanction of the Board? Are you in favour of the enforcement of a penalty for any evasion of the Board's terms of contract? Are you in favour of the Board, where possible, doing their own work direct, and without the intervention of a contractor? Are you in favour of practical mechanics only being appointed by the Board as clerks of works? As a body, the Progressive candidates have answered these questions in the affirmative. The Hon. Lyulph Stanley thinks that the Board might do its own repairs, but does not deem it practicable that it should build new schools.

The 141st session of the Society of Arts will be inaugurated on Wednesday next, when the opening address will be delivered by Major-General Sir John Donnelly, K.C.B., chairman of the council. The papers to be read before Christmas include "The Electrical Treatment of Sewage," to be read on Dec. 5th, by Mr. E. Hermite, and another on "Forestry," by Lieut.-Gen. J. Michael, C.S.I., to be read on Dec. 19th. Among the papers for meetings after Christmas are "Electric Lighting of Ecclesiastical Buildings," by Major-General Charles E. Webber, C.B., and "Technical Carpet Designing," by Mr. Alexander Millar. The courses of Cantor lectures will include a series of three by Mr. Alan S. Cole, on "Means for Verifying Ancient Embroideries and Laces," to be given on February 11, 18, and 25.

A loan exhibition of some 300 pictures was opened in the Queen's Hall of the People's Palace, Mile End-road, on Saturday. The pictures include Bauerle's portrait of the Princess Louise of Wales, Webster's "Sunday Morning," Mr. Watts's "Gill," Professor Herkomer's "John Ruskin," Hacker's "Fire Fancies," Mr. J. W. Waterhouse's "Mariamne before Herod and Salome," Graham's "Rising Mists," and Sir John Millais's "Mr. Gladstone." Among those who have lent pictures are the Queen, the Prince of Wales, the Duke of Norfolk, Mr. F. Goodall, R.A., Professor Herkomer, Mr. Alfred East, Sir C. Tennant, Sir John Millais, and the Corporation of Nottingham. In a room adjoining the hall are loans from South Kensington and the People's Palace Sketching Club. The exhibition will remain open till December 1st.

It is satisfactory to learn that the recent statement which went the rounds of the London papers that John o' Gaunt's stables at Lincoln were about to be pulled down and rebuilt, is unfounded. The buildings were described by the late J. H. Parker, C.B., as probably the most valuable and extensive range of buildings of the 12th century that we have remaining in England. The origin of the rumour was that the fields behind the stables are about to be built on, but the 12th-century premises will be left intact.

The scheme of architectural education recently organised by Mr. Henry R. Babb, headmaster of Plymouth School of Art, has commenced. Mr. B. Priestly-Shires, A.R.I.B.A., delivered on Thursday in last week the opening lecture of a course on "The History of Architecture, including an Analysis of Mouldings, Features, and Ornament." Mr. Shires dwelt at length on the different forms of Greek temples, and mentioned the architects, sculptors, &c., connected with the more important ones. It is hoped before long to establish an architectural association for the "Three Towns"—Plymouth, Devonport, and Stonehouse.

Electric wiring is a matter that few architects trouble themselves about. They are content to leave it to the electrician. Among the necessary rules which have been framed is the necessity of providing an extra covering where the wires pass through walls and floors. These coverings should be durable and moisture proof, and of good insulating material; where the wires run along ceilings and walls, they ought to be separated by an interval of about 3in., and each wire where it passes through a wall should have an aperture to itself. Another necessary precaution is to avoid all metal gas-pipes, speaking tubes, &c. Where these have to be crossed the wires should be bridged over with wood or hard rubber tubing. Between wires and hot-water or steam pipes an air space of 4in., at least, must be allowed. An eminent English authority says no wiring is to be imbedded in the walls or under floors, or in any inaccessible position. Composition metal tubes are to be used where casing is found impossible, but these should not be longer than can be threaded.

The German Archæological Institute in Athens has resumed the excavations at the Western base of the Acropolis at Athens. The object in view is the discovery of the Enneakrounoi, the ancient nine-piped well, the site of which is essential to a correct topography of ancient Athens. Herr Dörpfeld, who is conducting the operations, reports that a well of the time of Peisistratus has been found between the Areopagus and the Pnyx, west of the Acropolis, at the spot where, according to the description of the market by Pausanias, the Enneakrounoi, constructed by Peisistratus, was situated. If the further excavations show that the Clusinion lies above it and the Odeon below, its identity with the latter will be proved.

* * *

New National schools are being erected at Coleraine, Ireland, and special consideration has been given to the ventilation, which will be carried out on the Boyle system, the latest patented improved form of self-acting air-pump ventilator being adopted for the extraction of the vitiated air.

The monthly report of the Labour Department states that "though fairly well employed as a rule for the time of year, the various branches of the building trades show a slight falling off, not, however, more than is accounted for by seasonal cause. The percentage of unemployed in the unions concerned has risen from 3·6 to 3·8. The furnishing and wood-working trades continue fairly busy on the whole. The proportion of unemployed in the unions connected with these trades has fallen from 4·7 to 4·6 per cent.

A new eight-day illuminated turret clock has been erected in the Grand Hotel, Ashington, by Messrs. Wm. Potts and Son, clock manufacturers, Leeds and Newcastle-on-Tyne, who are also making a new Cambridge-quarter clock for St. Cuthbert's Church, Crook, co. Durham.

An action of ejectment was before the Court of Appeal on Wednesday, in which the owner of some small houses at Limehouse sought to recover possession of them from the sub-lessee for non-payment of rent. The defendant, who had spent £400 on sanitary works upon the property, sought by a counterclaim to recover this from the plaintiff, but Mr. Justice Charles had decided against him. The defendant contended that, as the plaintiff had demanded a halfpenny too little, the claim was, under an old statute, invalid. The Master of the Rolls admitted that the "dear old judges" had thus laid down the law: but he had long ago made up his mind that at the proper time he would over-rule such decisions. The defendant's appeal was dismissed.

St. John's Church, Egremont, was reopened on Sunday, after internal decoration carried out by Messrs. G. H. Morton and Son, of Bold-street, Liverpool. The style adopted is Byzantine, the building itself being an attempt to reproduce a Greek temple. In the sanctuary a richer treatment has been made use of than in the nave, the basis of the decoration in the eastern portion being a representation of the Resurrection.

MEETINGS FOR THE ENSUING WEEK.

Monday.—Royal Institute of British Architects. "Notes on the Architecture of China," by Frederick M. Gratton. 8 p.m.

Tuesday.—Institution of Civil Engineers. "The Machinery of War Ships," by A. J. Durston. 8 p.m.

Glasgow Architectural Association. Paper by Jas. Chalmers. 8 p.m.

Wednesday.—Carpenters' Hall. Lecture to students on "Sanitation," by J. Wright Clarke. 8 p.m.

Society of Arts. Opening Address by Major-General Sir John Donelly, K.C.B., Chairman of Council. 8 p.m.

Friday. — Architectural Association. "Sanitation in Regard to Hospitals and Infirmaries," by Keith D. Young. 7.30 p.m.

* * *

CHIPS.

Stanley Church, near Bishop Auckland, which was destroyed by fire during the November gale of last year, has been rebuilt, and has been opened by the Bishop of Durham this week.

The foundation-stone of the first permanent home on the Farm Colony for Epileptics at Chalfont St. Peters, in Buckinghamshire, was laid on Wednesday, by Mr. J. Passmore Edwards.

The Bill seeking powers for the projected new railway between Bristol and London, *viâ* Bath, Trowbridge, and Andover, will not be proceeded with this session, on the ground that insufficient time is available to complete the arrangements.

The Prudential Assurance Company of London have bought the London Hotel, St. Andrew-square, Edinburgh, and their architect, Mr. Alfred Waterhouse, R.A., is preparing plans for a new building, to be erected on this prominent site next year.

An Association of Yorkshire students of the Institution of Civil Engineers has recently been formed in Leeds, and the inaugural dinner was held in the Queen's Hotel in that city last Saturday. Sir Jas. Kitson, Bart, M.P., occupied the chair, and the toast of the evening was proposed by Mr. T. Hewson, the city engineer.

The foundation-stone of a new parish hall and Sunday school for the parish of St. Peter's, Middlesborough, was laid on the 14th inst. by Sir Raylton Dixon. The building consists of two floors. The lower floor will be used as a Sunday-school, and the upper floor as a parish hall, to seat about 400. The building is being carried out from the designs of Messrs. R. Lofthouse and Son, architects, Middlesborough.

There is now being fitted in the Pontifical apartments in the Vatican a complete system of hot-water pipes. These apartments have hitherto been without any heating apparatus, and in many of them there are no fireplaces.

The school boards of North Staffordshire are combining to provide a deaf-and-dumb school, and have decided to acquire for the purpose The Mount at Penkhall. The plans prepared by Mr. E. E. Scrivener for altering the premises have been approved by the Education Department, and will soon be carried out. Accommodation is to be provided for 28 blind and 108 deaf-and-dumb children, and the entire cost of acquiring The Mount residence and grounds, and adapting the residence to the purposes in view, is estimated at £13,200.

For £35, the corporation of Deal have agreed to purchase, from the War Department, all that is left of Sandown Castle, erected by Henry VIII., with Deal and Walmer Castles. The ruins are being acquired for sea defence purposes.

In memory of the late Mr. William Norton, a stained-glass window has been placed in the lecture-hall of the Congregational Church, Truro, with which he was connected as deacon, teacher, and school-superintendent for forty years. The window, supplied by Messrs. T. and W. Farmiloe, Westminster, comprises three lights, the centre portraying Christ blessing little children.

The new schools for the Barrow-in-Furness School Board are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

In the case of the application for discharge from bankruptcy of George Taverner, of Lyndhurst, builder, the application has been adjourned *sine die*.

The Council of Egyptian Ministers has voted a sum of money for archæological exploration in Nubia.

DOULTING STONE.
CHARLES TRASK & SONS.
DOULTING, SHEPTON MALLET.
London Agent:
E. A. WILLIAMS, 16, Craven Street, Strand, W.C.

FAMBRINI & DANIELS,
Manufacturers of IMPERISHABLE CONCRETE MASONRY for
CORNICES, STRING-COURSES, MODELLED PANELS,
And Every Stone-Work Requisite.
LANDINGS and Plain or Moulded and Mitred STEPS, durable throughout.
NO SPECIAL FACE REQUIRED.
WORKS AND OFFICES: LINCOLN.

HAM HILL STONE.
The attention of Architects is specially invited to the Durability and beautiful Colour of this material.
Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.
Address:—
THE HAM HILL STONE COMPANY,
NORTON, STOKE-UNDER-HAM, SOMERSET.
London Agent:—
Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

WM. OLIVER & SONS,
MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,
120, BUNHILL ROW, LONDON, E.C.
The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender; it adds to the value of the information.

Belfast.—For internal plumbing and gas-piping at new National Bank, &c., Belfast. Mr. W. Batt, Garfield Chambers, Belfast, architect:—

Dowling, J., Belfast (accepted) ...	£215	10	0

For electric wiring switches, &c. (exclusive of fittings):—

Laing, Wharton, & Down, London*	196	0	0

* Accepted.

Bermondsey, S.E.—For alterations, &c., to stabling, Jacob-street, Dockhead, for Messrs. R. Chambers and Co., 58, Mark-lane, E.C. Messrs. W. Eve and Son, 0, Union-court, E.C., architects and surveyors:—

King, W. R.	£179	0	0
Harris and Wardrop...	175	0	0
Johnson, J. H....	163	0	0
Newman...	145	0	0
Chafen	143	0	0
Josolyne and Young, Borough* ...	142	10	0

* Accepted.

Bermondsey, S.E.—For erecting on a vacant site in Page's-walk, Bermondsey, three new temporary iron buildings, for the London School Board:—

Charteris, D.	£1,880	0	0
Cruwys, T.	1,764	0	0
Croggon and Co. (Limited) ...	1,735	0	0
Keay, E. C. and J. (Limited) ...	1,663	17	0
Humphreys (Limited), Knightsbridge (accepted)	1,644	0	0

Bermondsey, S.E.—For erecting new offices and drainage for the boys' and girls' departments of the Southwark-park School, Bermondsey, for the London School Board:—

Foxley, G.	£1,520	0	0
Parker, G.	1,390	0	0
Newton, G.	1,313	0	0
King, H., and Sons	1,290	0	0
Calnan, M., and Co.	1,231	0	0
Stevens Bros., Yonge-park, N.* ...	1,226	0	0

* Accepted.

Bicester.—For repairs, alterations, and sanitary work to The Priory, Bicester, for Mr. G. R. Norbury. Messrs. W. Eve and Son, 10, Union-court, E.C., architects and surveyors:—

	A.	B.	C.	D.
Head, W. B., and Son:—	£259 0 0 ...	£135 0 0 ...	£141 0 0 ...	£535 0 0
Smith, J. W.:—	178 10 0 ...	90 0 0 ...	120 0 0 ...	388 10 0
Kingerlee:—	153 0 0 ...	67 0 0 ...	105 0 0 ...	325 0 0
Bartlett Bros., Witney (accepted):—	172 10 0 ...	65 0 0 ...	83 10 0 ...	*321 0 0
Grimsley and Son:—	185 7 0 ...	—	... 132 9 0 ...	—

A.—General works. B.—New bath-room and w.c. C.—Drainage work. D.—Total.

Bournemouth.—For the making up of Grosvenor and other roads. Mr. F. W. Lacey, A.M.I.C.E, borough engineer and surveyor:—

Hoare, F., and Sons	£1,439	10	0
Saunders, W. H., and Co.	1,404	2	11
Troke, G. (accepted)	1,321	5	4

[Surveyor's estimate, £1,235.]

For making up South and other roads:—

Saunders, S., and Co....	£605	5	7
Saunders, W. H., and Co.	599	19	7
Troke, G. (accepted)	572	10	7

[Surveyor's estimate, £632.]

For making up western portion of West Cliff-road:—

Jones, W. E., and Son	£285	4	7
Hoare, F., and Sons	259	10	0
Saunders, W. H., and Co.	258	13	2
Troke, G.	220	9	11
Saunders, S., and Co. (accepted) ...	204	7	0

[Surveyor's estimate, £200.]

Bridgnorth.—For building tramp wards at the workhouse:—

Bickerton and Maddocks, Shrewsbury (accepted).

FRIDAY, NOVEMBER 23, 1894.

"AN ARTISTIC NATION."

MOST things have their uses, at one time or another; and even a wet blanket, on occasion, may do invaluable service. But it is startling when an observer of the humorous side of life, like Mr. H. S. Marks, R.A., presents himself to us in this depressing character. It is true that he does not act the part very long. Its assumption was due, we may hope, to a passing shade of feeling: to the sense, perhaps, of uncongenial surroundings, which, at times, must come over every man of cultivated tastes. Such a man soon learns by experience that the people who really appreciate him are few, and that, even if he is popular, his popularity is brought about, not so much by the best elements in his work, as by the second-best or third-best ones. The multitude learn by hearsay that so-and-so is excellent, and they praise him for his excellence; but what they really like in him is not that which is above them, but that which is on their level. When he happens for a moment to reflect on this, and to consider how much, or, rather, how little, their admiration is worth, we need not wonder if, like the courtier whom Touchstone disputed with, he "disables their judgement"; nor, supposing him to be an Englishman, if he says in his haste, as Mr. Marks does in his recent volume, that "England never was, and never will be, an artistic nation."

Yet, if taken seriously, an utterance like this, by an artist of eminence, may do a great deal of harm. It is bad for the student who aims high to be impressed with the idea that his very nationality is against him. We are only beginning in these days to learn the immense power of suggestion. A hearty belief in one's capability to do a thing goes a long way towards making the thing possible: a sincere disbelief, on the contrary, may produce a kind of spiritual paralysis. If anyone thinks that he has already attained, and is already perfect, by all means disabuse him; but do not discourage him in the race by prophesying beforehand that he will never win. You don't know what you can do till you try. You don't know what desperate mistakes the most successful men have, at one time or another, made. You have never seen what miserable failures the greatest workers in every art have produced, even side by side with the masterpieces which have made them famous. Most important of all, you have never looked upon the slow, painful steps by which they gained their height. Nothing would be more instructive, nothing more encouraging, than to study, if we could, the long series of attempts by which the masters of our craft came to be what they were. But it is with the great men of old as it is with some great works of antiquity: the result remains, the means which produced it have disappeared. The traveller comes upon an enormous monolith, raised and left where all the engineering resources of to-day could hardly put it, and he thinks a race of giants or magicians must have set it there. Not at all. The people who reared it were not as big—perhaps not half as strong—as an English labourer. But they worked with a will, and took no count of time. Year after year, it may be, they built up a mountain of earth. Month after month they dragged their monolith up its sloping side—an inch in a day. At last they set it in its place with rejoicing, and then they dug away the mound. So it has been with many a great accomplishment: the monument remains, the mound has disappeared, and the faint-hearted say, "There were giants in those days."

There is no need to point out how likely Mr. Marks's words are to aid and comfort the Philistine, who is already too strong in the land. "If we never were, and never shall be, an artistic nation," he will say, "what is the use of spending all this money and trouble in trying to make us one? How much does the Science and Art Department cost us? How much do we pay yearly for the National Gallery, and how much for the Kensington Museum? Here is an opening for the reformer; here is a possible saving for our pockets in these hard times." The "practical man," with an R.A. to back him, is likely in this way to become more rampant than ever! Like the wife of Andrea del Sarto, in Browning's poem, he can only be pacified and kept quiet while noble work is being done, by having it constantly whispered in his ear how much money that work will bring in. If we once let him think that our work, in the sphere of art, will never bring in enough to pay for the training of the workers, he, as far as in him lies, will stop that training for the future. Let us see what the facts are.

We will leave the prophetic part of the utterance. One prophet is as good as another, when neither can show anything to support his claims; and a prophecy on our part, or on the part of anybody who agrees with us, that England will be an artistic nation, would be a fair set-off against Mr. Marks's prophecy that she will not. But the historical side of the question can surely be settled, one way or the other. Has England ever been artistic? The answer to this depends on what the word "artistic" means. Some people—and we rather suspect that Mr. Marks in this place is amongst them—use it in as limited and conventional a sense as that in which other people use the word "moral." A, they tell us, is envious, and hateful, and uncharitable, but at the same time highly moral. B has been convicted of theft, and C of murder; but their morality has always been above suspicion. To be moral, with people who talk in this way, is to keep one particular commandment; and to be artistic, with people who talk in a parallel way, is to be versed in one particular art. This, of course, is the art of painting.

With this enormous limitation, England may, perhaps, plead guilty to the impeachment, and feel none the less hopeful for the future in doing so. For, after all, painting is not an art which very deeply affects the daily life of a nation. Poetry, which is infinitely higher, is incomparably more pervasive. Very few of us can have a picture of Titian's, very few can so much as have a sketch by Constable; but we can all keep beside us the best that has been written, from Chaucer to Tennyson. Here is an art in which England has held her ground for twenty generations, and bids fair to hold it still. But it may be said that a score or two of poets do not show that a whole nation is artistic. Even this is not so certain. If, now and then, a man arises who can thrill the world by the expression of his feelings, it is because he had ancestors and contemporaries who could feel, though they could not express. But in the most universal arts of all—in architecture and its offshoots—England was for ages, and in the most literal sense, an artistic nation. What nation was more so? Scarcely even Italy, and assuredly no other state in Mediæval Europe. France, in the Middle Ages, dreamed of magnificent cathedrals, and left them unfinished. England counted the cost beforehand, and, in the main, effected what she set her hand to. It was not only a few great architects who did this. Every workman in his way was an artist. The village mason—too obscure to leave so much as a gravestone behind him—yet bequeathed us some fragment of a moulding, some boss or finial, which tells us that he, too, was a maker, and one not easily rivalled. The village carpenter worked his door or his bench-end, or, perhaps, his porch, so soundly that it has stood till now, and so beautifully that every cultivated person would grieve to find it gone. The blacksmith, in the interval between his horseshoes, wrought, perhaps, a hinge, perhaps a stanchion-head, that proved his "mystery" worthy to rank with those of his fellows; while—most astonishing of all—the very plumber was human and had an eye for beauty. And all this did not happen only in one place. It was not at some favoured spot, where the monarchs of the period had set up the Middle Age equivalent for a School of Art; it was everywhere, from the Channel to the Thames, and from the Thames to the Tweed.

We shall be told, perhaps, that down to the 16th century or later all Europe, and not England only, was artistic. This is true. But, judging from the remains that are left, art in England was more universal and went deeper down into the nation than almost anywhere else. In Italy it belonged chiefly to the rich and powerful. Its accomplishments there were too costly for common use, they were for popes, and princes, and kings. In France, too, they were chiefly for the Church and the nobles. Germany and the Low Countries had less ambitious works mixed with their great ones; but it is in England supremely that we find a homelike, unpretending loveliness, even about the very cottages of the poor. And this outlasted the decline of all of English art in general. A certain feeling for quiet beauty had become part of the very selves of Englishmen, and it was long before it could be preached and educated out of them. This, indeed, was effected for a time, their nature was expelled with a pitchfork; but we have seen, in our own days, how quickly and enthusiastically they return to the abandoned types. The artistic instincts of the country have not been dead, but sleeping, and they bid fair, in another generation or two, to be as active as ever.

No race, perhaps, is wholly without capabilities for art. Even the Jews, who seem to have left nothing in Palestine but tombs, and those mere excavations in the rock, have since given to the world noted painters and great musicians. Our ancestors, or a powerful section of them, tried hard, some three hundred years ago, to make their own tastes and habits Jewish. Like all imitators, they found it easiest to copy the weak points in their model. The grandeur of Hebrew literature was beyond them, but the Hebrew incapacity for producing art and the Hebrew intolerance of it when produced by others were quite within their reach. This imitative spirit has scarcely died out yet. Some of us can remember how a Quarterly Reviewer once tried to send us back to Solomon's Temple as the very fount and source of all perfection. This sort of teaching, more than anything else, made England for a time an inartistic nation. But its influence is passing away. We shall again be ourselves; and, though we may never equal the sculptors of Greece or the painters of Italy in their particular lines, we shall once more, as of old, be first in our own. There are far finer flowers abroad than at home, but they do not line every wayside and cover every field, as English ones do; and a great living naturalist has declared that in all the glories of the Tropics there is nothing so fair as a common full of gorse or a wood full of bluebells.

COMMERCIALISM.

THE Catalogue plays a large share in the practice of architecture and building, As the outcome of industrial enterprise, there is much to be learned from these publications of our great firms. They show the progress made in various branches of building and manufacture, and they to a certain extent indicate the practical results of science in many directions. Often the catalogue is of more practical value than the treatise, for it gives what the treatise does not—the actual working-out of the problem to the requirements in such matters as heating, ventilating, draining, and plumbing. Many important branches of construction, like those of fireproof floors, lifts, and roofs, are detailed in these published pronouncements of the trade, which are of much use to every architect and engineer. There is another aspect of the trade catalogue equally instructive, which shows the development of the commercial and competitive spirit, and it is on this we wish more fully to dwell. Commercialism is destroying the vitals of all art. Let us take a few instances. Pictures are no longer confined to the studios of artists, but are vaunted in galleries which have become rather bazaars for picture buyers and gossips who have more leisure than appreciation of painting. Their subjects and handling are often chosen with the ostensible object of gratifying the popular taste for thrilling incident, domestic commonplace, or for a kind of landscape and seascape which invariably appeal to people who like their walls adorned by gilt frames. Like the reader of novelettes and sensational fiction, the average picture-buyer looks rather for a kind of cheap effect than for any higher or deeper motive that can only be discerned by educated and critical persons. In fact, the modern painter must paint "down" to the level of the ordinary British public. It is the same with furniture and art decoration. The makers of marketable furniture of the Curtain-road style are quite alive to the class of goods which command the largest sale, and it would be useless for them to keep in stock any designs after those masters of the 18th century like the Adam Brothers, Chippendale, or Sheraton, or those revivalists of the period which the high-class manufacturers produce. The architectural furniture designer who turns out work from the designs of Mr. Norman Shaw, Mr. Edis, and others find only a limited sale for their goods, simply because such furniture does not "take on." In wallpapers, though, a better taste prevails: the general purchaser prefers certain decided patterns and a lighter key of colour. Subjects, rather than decorative patterns and colour, are chosen: floral devices, animals, grotesques, and even figures are the most saleable. To digress a little, people like to have a subject or story told both in pictures and wall decoration; they have not yet learned to appreciate what has been called the "Persian Carpet" theory of painting—that is to say, that a picture should be beautiful in itself, without telling any story. The advocates of this extreme school, "Impressionism," as it is sometimes called, tell us that a portrait should be reading of character, not mere delineation of feature; a landscape the ideal representation of form and colour—all that makes it beautiful, instead of the minute drawing of every object. Now there is considerable truth in this presentment of nature, and all real decoration should be of this character. Speaking of pictures, Mr. Whistler has said the "vast majority of English folk will not consider a picture as a picture, apart from any story which it may be supposed to tell"; they will not consider it, in short, as a beautiful colour study or mosaic or carpet, or blending of hues of light and shadow; but we need not now carry this discussion further.

The spirit of commercialism is rampant in architecture; every trade is more or less under its influence. At one time every artificer depended on the honesty of his trade: he sought to make it useful, his motive was to aid the architect, and to make his work harmonise with the design; it is now to make it independent of the architect's work if possible, to make it attractive as well as remunerative. Just as the painter panders to the popular taste for humorous or pathetic incident, placid lakes and mountain scenery, the manufacturer seeks to please by all kinds of devices and tricks. His catalogue is at once comprehensive and attractive. If of metal castings or ironwork, he shows us everything from a window-fastener to a wrought-iron church screen, chimney jambs, and sanctuary ornaments, and the designs are characterised by the usual desire for a tricky display and ornament which invariably captivates the vulgar and untrained eye. The tesselated paving manufacturer indulges in varied and brilliant colourings, in panels for stoves and hearths containing landscape or figure groups and other pictorial subjects, defiant of all canons of good taste. He likes embossings and bright colours, and his one aim is to quote low prices by the yard super. In almost every department we have the same evil. From the house-furnisher to the cemetery mason everybody is ready to sell us art "by the bushel," so to speak, at a bargain, and ready made. The danger, in fact, is in making art "cataloguish," of valuing and describing everything by the foot or the yard, like flooring or carpets. And it is this "shopkeeping" view of the artists' and manufacturers' work which has almost extinguished the real artistic sense, and has done so much to make the public undervalue the real artist. Again, in stained-glass work the limits and methods are wofully misunderstood. Popular taste still prefers pictorial designs. Subjects from classic legends, mythical romances, nursery rhymes, and even landscapes are forced into windows and panels of secular buildings without any restraint. As a decoration, stained glass is not understood by the general public; they will admire one of those highly-modelled, coloured, and shaded German windows, seen in a few church walls in which the tracery is entirely ignored; but they cannot see any beauty in the old examples of painted glass of many of our churches in which light is admitted as the first essential. Imperfect though the drawing of many of our old windows are, the glass is decorative, and fills the lights with a charming variety and blending of colour. There may be no design clearly traceable, as in the great west window of Winchester Cathedral; but still, it has a decorative value. Look at some of the modern glass used in panels or medallions! Atrocious colours, of blues, purples, reds, and greens, without any harmony, fill up all the space. There is no proper proportion of white glass to give light. There is a medallion or panel in the centre, filled with a badly-drawn figure or floral device; but this kind of leaded glass is turned out by the yard to suit the love for decorative display. Like cheap pictures and engravings, people will have stained glass and tesselated tiles, and ornamental chandeliers and electroliers, and decorated stoves and furniture; but as to the real merits of the designs, or who produced them, they do not trouble. If they are bad copies of Burne-Jones, or Norman Shaw, or Aldam Heaton, or any of our leading furniture designers, they are sought after, it may be with greater eagerness; but the element of personality or individual genius is, after all, a minor matter with the public, who go in for decoration at any price.

In the old days such new-fangled productions were not known; there was no attempt to make glass, or leather, or wood assume other appearances than their own, or to treat them otherwise than plainly and honestly. But now the commercialism of the age has introduced a number of products—plastic, fictile, and textile—which are all more or less counterfeits for obtaining decorative effects. We have not only our "Chippendale," "Sheraton," "Empire," and bamboo chairs and tables, but machine imitations of lacquer goods, "crocodile" glass and "leather." Some very pretty effects are obtained by subjecting glass to certain agencies, by which the crystalline forms of hoar frost and other natural forms are produced; but we may have too much of this sort of thing, and at a serious expense to true art. Perhaps one of the most remarkable instances of imitating hand-work is to be seen in the decorated panels of our rooms and West-end buffets and large passenger steamers, in which the wainscot panels are carved or engraved by a mechanical process, with the ground gilded. Italian and French arabesques are reproduced with precision, and the general effect is all that can be desired. Perhaps, after all, it will be impossible for our architecture and its allied industries to recover the position it once held, but we can endeavour to raise the level of public taste. Several influences at present are at work in making art commercial. The first and foremost is that of competition, which, as at present conducted, prevents a fair contest amongst real artists. The big firm with machinery and plant makes it impossible for one man to compete single-handed. He is "over-weighted." The contract is too much governed by tender, too little by honesty of purpose. The payment of the profession by commission is equally inimical.

As long as architects are paid in the same way as the auctioneer and the broker, the public will not be able to distinguish their services. As long as the architect charges 5 per cent. for buildings, good, bad, and indifferent, it will be hard to make the ordinary man think there is anything artistic about his work, or that it stands in the same category as that of painting. The eminent painter's work commands a high price in the market, which is estimated by his artistic genius; the skilled physician and lawyer both command fees in excess of those paid to average practitioners; but the architect's fees are uniform, like those of the auctioneer and house-agent. Can we be astonished that the art he professes is measured accordingly? If payment for services is on one uniform scale, can we wonder that the business and money-making architect prefers to take the most remunerative kinds of work, and even pander to tradesman-like devices in obtaining commissions?

Lastly, the want of education stands in the way of any immediate improvement. The average client looks at nothing but the barest results of mechanical labour, the quantity of bricks and timber, or the finished structure. He cares little or nothing about design or plan, motive, or artistic sense; how much thought has been expended on paper. A book of designs or patterns, or a trade catalogue is of far more interest to him, so that he can select what pleases his fancy. The architect soon finds out that he may throw away much more time, thought, and invention on the work than he will ever get paid for. It is like throwing pearls before swine; he accordingly does not scruple to make use of those expeditious means which are suggested to him by everyday practice. The "provisional sum" is an easy way to transfer his duty; the illustrated catalogue offers itself readily in questions of fixtures and decoration. The phrase "not exceeding so much per foot run," or "yard superficial," or "per piece," as the case may be, supersedes labour and invention, and in those ways the commercial spirit creeps into every transaction.

The new board schools, Cardiff, are being warmed and ventilated by means of Shorland's patent Manchester stoves, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

THE EXAMINATION QUESTION.

TWO or three important questions have been raised at recent opening meetings. The examination question was broached at the meetings of all the three leading bodies of the profession, and from the remarks made it is evident there are two views of the subject—one coming from those who wish to make the entrance into their own ranks secure, the be-all and end-all, the other from those who wish to institute a test of qualifications for all who enter the profession. The first party are anxious to make all competent men members of their own body, and ignore any legislation which seeks to impose a test of competence on all outsiders who practise architecture. This imperfect and "dog-in-the-manger" policy has been pointed out in our pages as only benefiting a very small proportion of the whole profession. The President of the Society of Architects, Mr. Hamilton, has spoken of this qualifying test in a comprehensive sense and more liberal spirit. As a test for membership, some form of examination is absolutely essential to secure that modicum of professional knowledge which every member ought to possess. It should undoubtedly take cognisance of the candidate's general education, his acquaintance with materials and construction, and his general ability in questions of art and design.

That he should submit satisfactory proofs of his architectural powers, in the form of designs and executed buildings, goes without saying. But the intentions of a professional body or any society should not stop here: they should be directed to the education of students and pupils, and of assistants already engaged in architects' offices, who one day may claim to be admitted, or to a course that will be preparatory for any examination under a Registration Act. We are, therefore, glad to see that the S.A. council contemplate the formation of a students' section, and in this connection we may suggest that all students, whether members or not, may be admitted under certain conditions. Instruction to be really useful must embrace a bold acceptance of all modern as well as old materials and inventions. It is too much the rule to direct the student's mind to academical or archæological studies first, with the consequence that the mind gets filled with ideas and forms before it is able to master the actual conditions which gave birth to those forms, and which ought logically to be learned first. Mr. Beresford Pite rightly pointed out the weakness of the Institute Art section examination when he said its syllabus seemed to imply that the materials and power of design depended on a knowledge of the forms and features of ancient architecture. A more mistaken view of art cannot be conceived; but all our art schools and educational classes have assumed that it is necessary to verse the student thoroughly in the forms of ancient Classic and Gothic architecture before they teach him the fundamental principles of all building art. Models and photographs of important historic edifices are valuable helps after the student has been taught the rudimentary problem of how to design on rational principles. As Mr. Hamilton said, the aim of such studies as the best examples of Classic, Gothic, and Renaissance afford should "be fundamental, not with the object of slavishly copying, but of learning the principles upon which the builders wrought." If the instructor or professor would give the probable reason of such-and-such a feature, like a cornice, or a roof, or the form of a window, he would be doing the right thing. Instead of which, copies of Classic buildings and Gothic edifices are set before the student to reproduce, without any comment or instruction. And it is precisely the same in giving the student examples of construction like framed roofs, partitions, masonry, &c., to copy, which we find in many schools of art. They copy, but do not understand the reason of this or that construction.

One point in connection with the student's qualifications has not received the attention it deserves, though it has been incidentally pointed to—namely, in what sense and how far is an examination to be taken as proof of an architect's competence in design? We must all acknowledge that an "artistic sense," as the president of the Society called it, is, first of all, essential to an architect; but how is this sense to be tested by question and answer? It cannot be so tested. As we lately remarked, there is just a fear that an examination—excellent as it is as a test of ordinary knowledge—will be looked upon by many as the aim and end of all effort; that professional equipment in the essentials of construction will be taken to represent a complete architectural qualification. Nothing can be farther from the objects and aims of the architect. If it should tend to make the student indifferent to the prosecution of further study, its effect will be disastrous. If, for instance," the candidate who has "passed" by "cram" in necessary elementary subjects thinks he has acquired all that an architect should know on art matters, the test will have the result of bringing into the profession men who have little qualification for the title of architect. Good mechanicians, experts in mathematical analysis, surveyors, theorists in construction, business men will have the best opportunities of entering the ranks, while men who have a highly-developed artistic sense, artists and draughtsmen, will necessary be excluded. It would be injurious to the best interests of the profession if it should turn out that the examinations instituted repelled men who had naturally the instinctive faculty of art, and hence the importance of considering the subject from two sides. The examination should be made attractive to both the student skilled in science and technical subjects and to those who are by nature and training artists. We are of opinion that it would be an error to make one course or syllabus binding on all. The division of subjects adopted by the Surveyors' Institution in their examinations has worked well; and a like subdivision of subjects may be necessary for architectural students. As a preliminary qualification, however, every candidate ought to be able to prove his talent in design by some infallible criterion. There are certain subjects which every candidate would be required to pass in a preliminary examination, such as the elements of construction, the use and strength of materials, elements of surveying and valuation, law of landlord and tenant, of fixtures and dilapidation, &c.; but specific subjects or subdivisions might be left to each candidate to determine for himself.

BRITISH BUILDING STONES.—XV.

THE probable origin and mode of formation of igneous and sedimentary rocks having been considered, there is yet another class of rocks mentioned in the Building News Quarry List which are neither igneous nor sedimentary, though they partake of the characters of both. Metamorphic rocks are those which have been altered from their original condition by external or internal forces; these have affected their structure, mineral composition, and texture. Metamorphic rocks are unstratified, as some granites; stratified, as marble; and stratified with cleavage planes, superinduced as clay-slate, which splits into leaves at an angle having various inclinations with the rock-bed. As many clays and sandstones yield the same ultimate chemical analysis as some granites, and as the latter bear unmistakable evidence in many cases of having been melted down from pre-existing rock, sometimes even from granite, it is concluded that such rocks are of metamorphic origin, and are indeed clays or sandstones melted down, and perhaps remelted, always under great pressure, and in presence of water. It is well known that chalk, or ordinary limestone of any kind, if burned in a kiln, becomes converted into lime. Now limestones at present lying some thousands of feet under the surface have been subjected to heat infinitely greater than that of a limekiln by the intrusion of molten rocks, such as granites and basalts; but these limestones are not, and cannot be, converted into lime, for the air has no access to them. In other words, the carbon dioxide is shut up with the limestones, and cannot escape as it does in an ordinary kiln, and the effect of this is to convert these limestones into marble—that is, to alter the structure of an earthy limestone, such as chalk, and convert it into a crystalline rock, such as statuary marble. Chemically, both these rocks are identical; the only difference is in their structure, which difference has been induced by pressure, heat, and moisture. Hence marble, using the word to mean crystalline limestone, is a metamorphic rock. How is it known that chalk has been altered into marble in this way, if this rock so altered must, of necessity, have been acted on by fire and moisture at such a depth from the surface? In Antrim, in Ireland, where the chalk has been upheaved, and is overlain by a once molten sheet of basalt, the former is converted into hard crystalline marble. Similarly, in Donegal, carboniferous limestones are converted into marble when in contact with granite, and wherever non-crystalline or earthy limestone rocks have been invaded by igneous rocks, the former are converted into marble along the lines of contact, and the gradation from crystalline to non-crystalline is clearly traceable throughout. Ordinary white chalk powdered and melted with a little water under conditions of pressure which prevented the escape of its carbon dioxide, was converted into hard crystalline marble similar in every respect to the well-known statuary or Carrara marble. Hence it is inferred that all non-crystalline limestones may be altered into crystalline by heat and pressure in presence of water. The rock from which roofing slate is cleft was once a mass of soft clay. This clay was subjected to enormous pressure, laterally and vertically, and at the same time to intense heat. The effect of these has been to convert the clay into hard rock, and induce in it a structure called "cleavage," a property which permits the rock to be split into thin leaves in planes not coinciding with the original bed of the rock, and frequently at right angles to it. Every piece of sandstone invariably flakes off in places parallel to the original quarry bed of the stone; but a piece of a slate rock does not—it flakes off in leaves, which probably stand at right angles to the quarry bed of the stone. A slate is therefore set on a roof on its cleavage bed, not in its quarry bed; and where the original bed of the slate rock is not completely obliterated by metamorphic action, the slate will break across that bed. It is known that cleavage has been produced in this manner, for mud, beeswax, and other finely-divided substances have been poured into a box, and on being subjected therein to enormous pressure horizontally and at the same time vertically, the material so treated will have undergone a change called molecular re-arrangement, which permits it being split into thin sheets exactly in the same way as a clay-slate rock is split into slates. Now, if any rock which has undergone change since it was originally deposited is a metamorphic rock, it would be very difficult to find a rock which is not metamorphic, for all have undergone change more or less, and some have been altered several times over. Take a limestone, like the Binstead limestone for instance (Building News list, No. 36), or the "Paludina Marble" (No. 181). Here are rocks built up exclusively of shells of once-living organisms, fresh-water molluscs, chiefly Planorbis, and Paludina. Now, before these animals could secrete shells, which are calcium carbonate, this mineral must have been in solution in the water in which they lived, and could only have come into the water from the wearing down or denudation of rocks containing limestone. Again, the sandstones and millstone grits are all built up of the *débris*, more or less finely ground, of other rocks, such as granite, basalt, &c. One of the typical constituents of granite is mica. This is very clearly seen in many sandstones, chiefly in the "old red," and it is sometimes present in such quantities that it gives the stone a fissile character, the mica occurring in distinct planes, and always with the surfaces parallel to the bed of the rock. Rocks Nos. 55, 77, and 221 are striking examples of sandstones which can be readily cleft into "stone tiles," owing to the presence of mica. All these rocks have, therefore, undergone change since their original deposition. Yet they are not "metamorphic" rocks in the ordinary meaning of that term. Page ("Handbook of Terms," Blackwood, 1865) defines metamorphism to be "that change of structure or of texture which has been effected in many rocks by the agency of heat, chemical action, or otherwise." Seeley, in Phillip's "Manual of Geology" (Griffin, 1885), p. 356, says strata are "metamorphic" when they have been "transformed in structure or appearance by subterranean heat, or heat developed by pressure applied since their deposition." He opens this definition by indicating "aqueous" strata as being the strata referred to, and closes it by adding that "all strata" may become metamorphic. Granite rocks are not deposited in beds in layers like sedimentary rocks; they cannot, therefore, be referred to as "strata" of any kind. Yet they are clearly sometimes of metamorphic origin, so that it may be added, in addition to "aqueous" rocks and "all strata," all rocks whatever may become metamorphic. Prestwich ("Geology," Clarendon Press, 1886), p. 32, says: "Metamorphic rocks are those in which the molecular structure has been altered, new chemical combinations formed, and the structure rendered more or less crystalline. So great is this change in some cases, that the line of demarcation between rocks of metamorphic and those of igneous origin is often extremely difficult to determine. Rocks formerly supposed to be of igneous origin are now commonly considered to be altered sedimentary strata. By many granites are now held to be due to changes of this character." Green ("Physical Geology": Rivington, 1882, p. 399) says: "There yet remain a number of crystalline rocks which cannot be placed either in the Volcanic or Plutonic group. Most likely they were originally, all of them, bedded, derivative rocks; but they have been altered in such a way as to acquire a crystalline texture." Further on he says that the term metamorphic is "usually restricted to those rocks which have suffered transformation of so radical a nature, that it is only by long and attentive study that we become convinced they are merely the altered forms of some of these rocks we have become already familiar with"; and in a footnote to Prestwich's definition, already given, the author adds, "There is much difference of opinion as to where the line between these and the unaltered rocks should be drawn. Some geologists would exclude ordinary slates." Now, if geologists do not know exactly what rocks are metamorphic and what original, the quarryman and stonemason may be excused if their knowledge is so limited; but the endless vista of changes opened up by this question of metamorphism is startling, for if granite is but a melted sandstone, and that sandstone was a broken down granite, then granite was probably a sandstone, and so on; all these changes forming apparently links in an endless chain, reaching from the present into a past the extent of which the mind utterly fails to grasp. The question to be decided here is, How many times has sandstone been derived from granite which has been derived from sandstone, which has been derived from granite, until we reach the original rock found in the first instance from the cooled down gases of the incandescent nebula from which our earth sprang? It is believed that not a single rock is known to exist which formed part of the original crust of our globe. It may be well, however, to mark this important fact—that though the rocks have frequently changed in their structure and in their mineral composition, their chemical elements remain constant throughout; they are neither added to nor taken from; they merely combine to form new minerals and new arrangements of minerals, so that, though all rocks have undergone constant ceaseless change, there is a substratum eternal and indestructible which knows no change. Pursuing this extremely unconventional way of dealing with the geology of the British building-stones it may be well to get into the field, and consider some of the rocks *in situ*. A visitor to the Isle of Sheppy will have noticed that the cliffs to the north of Minster Church, and lying between that place and Warden Point, are composed of a bluish putty-like clay, which weathers of a deep brownish red colour. In dry weather this clay is fissured in all directions, when it parts with its moisture. In this clay are imbedded lens-shaped masses of clayey limestone, from a few inches to a few feet in diameter. These blocks, called "septaria," when broken with a sledge-hammer, reveal a curious partitioned structure, the divisions or partings, which sometimes radiate from the centre of the block, being completely filled with calcite; they were once collected on the beach at Sheppy and Harwich, and burnt in kilns, and ground to make "Roman" cement. Here and there through the mass of this clay, glistening crystals of a mineral called "selenite" may be seen. Some of these are from 2in. to 3in. long, and deserve notice, because this mineral is the same as alabaster, from which plaster of Paris is made, selenite, alabaster, and plaster of Paris all being known to chemists as calcium sulphate. Plaster of Paris is simply alabaster, or gypsum, with the water of crystallisation driven off. Another digression into chemistry is here almost unavoidable; but the opportunity is too good to be lost. Ordinary limestone is calcium carbonate, commonly called carbonate of lime. When this is subjected to heat, the carbon dioxide (carbonic acid) is driven off, the limestone being "decomposed," and lime only left. When, however, alabaster, which is calcium sulphate, or sulphate of lime, is subjected to heat, it is not decomposed, the water of crystallisation is only driven off, and a white powder remains called plaster of Paris. This is still calcium sulphate, but it has the property of reabsorbing part of its water of crystallisation, and setting hard. The clay of the Sheppy Cliffs is also found across the water on the opposite coast, where it extends to Harwich, and inland to Sudbury. A belt of it also runs from near Dorchester, past Salisbury, under Chichester, and dies out about a mile north-west of Worthing. A narrow band runs across the Isle of Wight from the Needles to near Culver Cliffs. The stratification of this clay is everywhere obscure. At Sheppy, where it is well exposed, it appears to be one great homogeneous mass without a trace of bedding of any kind. Where did all this clay come from, and what threw it down in this chalky basin under London, and along the southern coast of Dorset and Hants? First, then, in order to know something more of this subject, it will be necessary to "take off the quantities" approximately of the material being dealt with. It is not possible to say how great an extent of surface this clay covered originally; but a fair estimate of its present contents will be about six thousand square miles—four thousand for the London basin and two thousand for the Hants basin. The area of the London basin includes the present water-covered estuary of the Thames, between Sheerness and a line drawn from Harwich to Thanet. Now as this clay runs from a few feet thick in Wilts to 600ft. thick in Essex, a moderate estimate of its entire average thickness will be about 300ft., the contents of the whole may therefore be stated at 50,181,120,000,000c.ft., and this figure will be very considerably under the mark, for the clay at one time extended across the Channel to France and Belgium. All this fine impalpable mud was certainly deposited in water, salt water, probably an estuary of the sea, the carrying-power being some great river which flowed northwards from the Tropics, bringing down all this sediment with the Tropical plants and animals swept from its banks, and spreading the whole over the 6,000 miles of surface already indicated. That Harrow, Highgate, and Hampstead Hills should at the time have have been sunk in the sea 500ft. or more, below Trinity high-water mark, seems incredible, but it is nevertheless true. Now what was about the size of the great river that did all this navvy's work? It is not possible to say; but assuming it to be as big, and as dirty, as the Mississippi, then it would have taken thirteen thousand five hundred years to have deposited the London clay in the present London and Hants basins, allowing its work to be at the rate of 3,702,758,400 (three billions and three-quarters, roughly) cubic feet annually, this being the actual carrying work done at present by the great American river. It is remarkable that, although strata representing sands and gravels underlying and overlying the London clay are found in the Paris basin, resting conformably on each other, and giving no evidence of any break in time during their deposition, yet the London clay was quietly laid down in the London and Hants basins during an interval between the formation of two of these French beds; and there is no indication whatever in these beds of any lapse of time, much less of a period of 13,000 years, or even of the great physical changes which such a deposition implies. In the preceding sentence the technical term "conformably" has been used, and it may be explained here. When ordinary three-coat plastering is being done, the rendering is laid "conformably" on the brickwork or lathing, the floating is laid "conformably" on the rendering, and the setting is laid "conformably" on the floating. "Conformably" means, then, that each successive coat is laid on in layers parallel to the preceding one. Nature does not always work so regularly as the plasterer, for she will, after laying on her "rendering," squeeze it up together into great waves or undulations, and then, again, after laying on her "floating," she may take both and turn them completely upside down? In which case the successive coats are said to be laid down "unconformably," or, in plain English, "anyhow." When a joiner wishes to make a glue joint, he takes the boards to be joined, and having fixed them on his bench, he proceeds to plane down the waves or irregularities left by his saw; the edge of his boards, in fact, suffer "denudation" at his hands. Nature treats rocks in a similar fashion. She squeezes rocks together edgewise, so that they present a waved surface, something like a deal cut by a circular saw, only on a much larger scale, and she then proceeds to plane the irregularities down with tools far more potent than jack or trying planes—viz., frost, flood, rains, and tides—until she has made a smooth surface, and then other rocks are deposited on this, but *not* conformably. It has been stated that the great river which brought down the London clay also brought down and entombed the remains of certain plants and animals not known at present in these latitudes—except perhaps in Regent's Park—and many of which have been extinct for thousands, perhaps millions, of years. What were these like? Amongst plants, there were pines, oaks, magnolias, eucalyptus, custard-apple, gourds, melons, and millions of palm fruits and seeds. Trunks of trees, considerably worm-eaten, may be seen scattered over Sheppy beach, and choice collections of the fruits and seeds have been made in the cutting at Highgate Archway, in the late brickfields in Parliament-fields, and other places. Amongst animals are turtles of greater variety than the entire world now produces; a sea-serpent, called Palæophis toliapicus, though why they should have given him this name is a puzzle, for, so far from being an "old serpent," he was a brand new one, about 12ft. long—none ever having been found before; a kind of wild duck, called Odontopteryx (geologists and chemists always like simple names!), and this must have been a very wild kind of duck indeed, for it had jaws something like a Yankee cross-cut saw, the teeth being solid with the jaw, not mere "fixtures," and it may therefore be safely assumed that Odontopteryx was well able to secure a "close season" without the assistance of any Wild Birds Act or Game Laws. The foregoing remarks have been more in the interest of brickmakers who work the London clay extensively for bricks, rather than of the stonemason, for the latter can have little interest in the formation as a matter of business, except perhaps in a calcareous sandstone of purely local occurrence, found at Bognor in the lower beds. Here sandstone rocks of the London clay once, and that quite recently, formed a line of cliffs along the coast. Mantell says that the lowermost part of these rocks is a dark grey limestone, in some instances passing into a sandstone; the upper part is silicious. The Barn rocks, the Houndgate, and Street rocks, and Mixen rocks, south of Selsea, are portions of this same bed. Mantell adds that the septaria found in this rock are sometimes cut into slabs and polished.

DESIGNING OF STEEL BRIDGES, THEORETICAL AND PRACTICAL.—XI.

IN connection with the subject of the bearings or the bedding of girders, there are one or two practical considerations which require attention. The span, total load to be carried by the bed-plates, and the means to be adopted so as to deal effectually with the expansion and contraction of the material, due to the natural rise and fall of temperature, are all factors in the treatment of this detail, which are too important to be disregarded. At the same time it must be confessed that a great deal of nonsense has been talked, written, and, if we may use the term, constructed by adhering in a manner almost servile to the dictates of pure theory. We have inspected drawings and plans of bridges not surpassing the insignificant span of 40ft., in which there was more provision made for expansion and contraction over the bearings than in some structures known to us which have spans of seven and eight times that dimension. Independently of this question, to which we shall return subsequently, the absolute length of the bearing of a girder upon its supports must be first determined, and this is a matter which does not concern the girder alone, but has a special reference to the character, composition, and proportions of the supports themselves, whether they take the form of piers or abutments. It is evident that if the span, weight, and other conditions be similar, and that a certain unit of pressure per unit of area is not to be exceeded, then a comparatively narrow girder must have a longer bearing than a broader one. Obviously, also, a pier or abutment of solid masonry will withstand a much greater crushing strain per unit of area than similar erections of steel or iron, without taking cognisance of the fact that the latter materials would fail by reason of flexure long before their crushing strains were arrived at.

Let W equal the load upon the support, l the length, and b the breadth of the bearing, and w the safe load per unit of surface, which may be taken at one square foot. Then we have, keeping l and b in feet—

$$W = l \times b \times w.$$

The value of b, which is always rather in excess of the actual width of the lower flange of the girder, is nevertheless determined, as has been already amply demonstrated, by the exigencies of practical construction, and w is always a constant for the same description of building materials, so that the variable quantity is l, the theoretical value alone of which, apart from considerations to be hereafter entered into, will be given by the equation—

$$l = \frac{W}{b \times w} \text{ .... A.}$$

It is assumed that in all cases the absolute pressure brought by the girder upon the support is uniformly distributed over the whole of the bearing area by means of proper bed-plates, or if they be altogether dispensed with, as may be done in small examples, by a proper system of bedding. In the example we have selected for the plate girder, the expansion of the steel within the comparatively limited range of our normal temperatures requires but very little play. Until a span of 80ft. is attained, the arrangement shown in Fig. 1 will more than suffice for all contingencies. The points to be attended to are the following:—All the rivets beneath the bearing area of the ends of the girder are to be countersunk—that is, the holes of the rivets in the lowest or bearing plate are to be widened or drilled out, and the ordinary head of the rivet hammered in flush with the surface of the plate, instead of being hammered *in rilievo* on the outside. If very accurate fitting is considered necessary, this bearing end of the lowest plate may be planed smooth, which renders the girder the better able to slide slightly on its bed-plate. The surface of the bed-plate P in Fig. 1, upon which the bearing end of the girder rests, is planed true and smooth. It is laid upon timber half-balks, B, and consequently not less than 6in. in depth, which are let into the solid masonry or brickwork of the pier or abutment. The end of the girder, the bed-plate, and balk are all held down to the support by four bolts, which should not be less than 1in. in diameter. In order to allow the girders of the bridge to accommodate themselves to any fractional part of an inch that might occur as an element of the force of expansion, or of its negative corollary contraction, the holes for the bolts are made of an oval shape, the major axis being in the direction of the longitudinal axis of the main girders. In other words, the holes are slotted. It is not absolutely necessary to set the bed-plate B, which, in accordance with the subject we are treating of, will be of cast steel, upon a wall plate of timber; but it is usually done, especially in the case of railway-bridges or structures exposed to rolling loads of great weight, accompanied with a high velocity. The timber, which should be thick, is more or less of a slightly compressible character, acts in some degree the part of a cushion or buffer, and thus absorbs, or breaks to some extent, the impactive violence or actual shock of the advancing live load. In some instances, a sheet of lead, weighing about 8 or 9lb. to the square foot is placed betwen the bearing of the end of the girder and the cast-steel bed-plate, and in the other a thick pad or layer of asphalted felt is inserted between the same surfaces. Instead of planing the under surface of the lower plate of the bottom flange of the girder, the alternative, especially in large girders, is usually adopted of riveting or bolting a cast-steel plate, previously planed true and even, to the flange plate. The steel plate, in fact, becomes an upper bed-plate, capable of sliding, when such a movement does occur, upon its lower fellow.

Having now practically provided in the simplest manner for the expansion and contraction of a girder 63ft. in total length, it will be as well to ascertain by calculation what the elongation or shortening ought theoretically to amount to.

FIG. 1.

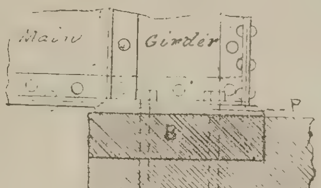

FIG. 2.

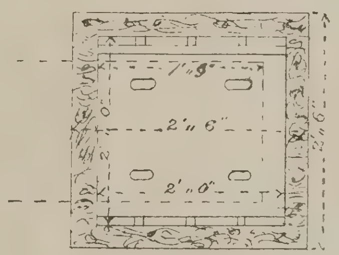

FIG. 3.

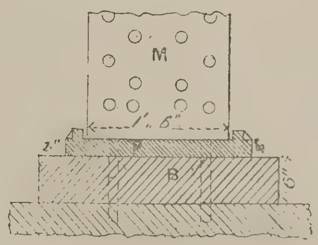

Steel, iron, all metals, and, in fact, all bodies, with one or two very rare exceptions, expand with the application of heat, and contract with the withdrawal of it. Restricting our attention solely to the former phenomenon, it follows, therefore, that each body expands a certain amount for a certain amount of heat. But as we are at present only concerned respecting the linear expansion of metals, it may be stated that steel, whether in the form of the smallest testing specimen or in that of the continuous tube of the Britannia Bridge, 1,510ft. in total length, undergoes an elongation which is proportionate to the rise in temperature to which it is externally subjected. For every rise of one degree there will be a corresponding elongation of a fractional part of the original length of the material, which will vary with the physical properties of that material itself. Consequently each material will have its own rate of linear expansion or elongation—that is, its own coefficient of linear expansion, which may be stated to be "that fractional part of its length by which it is elongated or shortened in consequence of a change of temperature of one degree." It may be remarked here that, as the coefficients for various materials are sometimes given in Centigrade and at other times in Fahrenheit degrees, care must be taken either to use the right thermometric scale, or to convert the value of the coefficient from the one scale to the other, as may be required.

We may now proceed as follows:—Let L = the original length of a girder at a temperature of degrees t, and L_1 its length when the temperature is raised to t_1 degrees, both t and t_1 belonging to the Fahrenheit thermometric scale. Put K for the coefficient of the linear expansion of steel, and we shall have—

$$L_1 = L + KL\,(t_1 - t),$$

from which—

$$L_1 = L\,[1 + K\,(t_1 - t)\,].$$

Make the actual elongation equal to E, and from the nature of the problem—

$$E = (L_1 - L),$$

so that we have by substitution—

$$E = L\,[1 + K\,(t_1 - t) - L,$$

which, by reduction, gives E a value of—

$$E = KL\,(t_1 - t).$$

But as in every instance the increase in temperature is either known or assumed, the value of the expression $(t_1 - t)$ is also known, we may write—

$$(t_1 - t) = N,$$

and we thus obtain a simple equation, in which—

$$E = KLN.$$

In the case before us, L is equal to 63ft., and if we put N equal to 70° Fahr., which will be an ample allowance for our climate, and K equal to 0·000006, we get our elongation—

$$E = 0{\cdot}000006 \times 63 \times 70 = 0{\cdot}02646.$$

As the value of L is in feet, the value of E will also be in the same denomination, so that the actual elongation or linear expansion, in inches, to be provided for in our plate girder is—

$$0{\cdot}02646 \times 12 = 0{\cdot}31752\text{in.}$$

In other words, the total elongation, owing to an extreme range of temperature for our climate, for a steel plate girder 63ft. in length, barely exceeds $\frac{5}{16}$in. Should the girder be free to expand over both abutments, which is unusual, the amount of each elongation would reach the insignificant figure of $\frac{5}{32}$in. In our own practice we have, for girders of a span of 75ft. as a maximum, dispensed with bed plates altogether, and simply bedded the girders upon two or three thick layers of asphalted felt laid upon the timber wall plates, and there they are to this day.

The actual amount of pressure which may be safely placed upon a pier or abutment must not exceed a safe proportion of the actual crushing strength of the material of which they are built. As a general rule, a weight or vertical pressure of sixteen tons per square foot may be safely placed upon an ordinarily constructed solid pier or abutment. A length of 1ft. 6in. has been taken for the actual bearing length of the ends of our plate girder of which the breadth of the bottom plate is also 1ft. 6in. It has been already mentioned that the bed-plate is in both its length and breadth rather larger than the absolute bearing area of the girder itself, and would in our present example be made about 2ft. by 2ft. By using formula A, enunciated in the first part of this article, it can be readily ascertained whether the dimensions will afford the requisite bearing area. From equation A, in which $l = \frac{W}{b \times w}$, we shall have, since the weight W supported at each end of the girders amounts to 55 tons for each abutment, the following values for the remaining quantities, b = 2ft. and w = 16 tons. From these data we obtain—

$$l = \frac{55}{32} = 1{\cdot}72\text{ft.}$$

A length of bed-plate, or, if the girder be simply bedded on the wall-plate, a length of bearing, of 1ft. 9in. will be sufficient for all contingencies. Practically, a bearing of 1ft. 6in. would meet all the working requirements; but we have, in the general tenor of our articles on this subject, as well as in those upon other cognate subjects, invariably preferred to err—if we may use the term in reference to the production of our own pen—upon the safe side. We consider it far more desirable that the young engineer and architect should be guilty of a little excess in the matters of estimation of loads, calculation of stresses, and distribution and apportionment of material, than that he should under-estimate any or all of these indispensable items and details of his design. If he accustoms himself to start on a fair, liberal basis, inclusive of the pecuniary or monetary factor, practice and gradual professional experience will, before long, amply point out to him how, and in what manner, he may safely make reductions in his original estimates. It must be kept in view that, in accordance with previous statements, a number of problems have been discussed, equations and formulæ deduced and practically worked out, and rules—some of rigid, and others of approximate accuracy—have been laid down, which obtain not merely for girders of the plate type, but for every description of girder, whether solid-sided, open-webbed, continuous or discontinuous, arch, bow-string, truss, rib, suspension, or cantilever.

It is evident that it would be futile in these days of excessive dead loads, and live loads running at exceedingly high velocities, to attempt to cause the bearing area—or what may be regarded as its equivalent, the length of the bearing—to be a constant fractional proportion of the span of the girder. A rough-and-ready rule was used in the early time of railways, in which the length of bearing was made equal to about the fourteenth to the sixteenth of the span, which in solid-sided girders was nearly the same as the proportion of depth to span. It is clear, apart from other obvious considerations, that the introduction of the open-web system of bridge-building, with a maximum proportion of depth to span of $\frac{1}{8}$, would render the adoption of this rule an absurdity, although it was not excessively disproportionate in girders the span of which did not surpass 50ft., of which there were abundance of examples in those days. A plan of the cast-steel bed-plate is shown in Fig. 2, with the slotted or oval-shaped holes, through which are passed the holding-down bolts, 1in. in diameter, which are carried down some 3ft. or 4ft. into the solid abutment, and secured to iron plates by large square heads. Sometimes special castings are made for these plates, which then take a wedge shape with the smaller end downwards. The timber wall-plate is frequently laid flush, or nearly so, as shown in Fig. 1, with the surface of the masonry or brickwork, as the case may be; or it may be raised altogether above it, as in Fig. 3, which is an end section of Fig. 2. Should there be any "beam filling," as frequently occurs when the roadway is brought up level with the tops of the cross girders and platform, the wall-plates are then necessarily imbedded in the abutments. It should be remembered, in setting steel-work in masonry or brickwork, that a small space or "clearance" must always be left between it and the other materials, for if they should happen to touch the last named are certain to get shaken, and possibly badly loosened. Again, in structures subjected to heavy rolling loads, the jar and vibration resulting from them will of themselves frequently produce an almost dislocating effect upon any work that is in any way badly put together. Sliding, rubbing, or friction plates answer perfectly well for the bearings of the main girders of bridges with spans not exceeding those alluded to; but when they pass these limits, it becomes necessary to adopt a nicer and more accurate adjustment of the details providing for the effects of changes of temperature. There are several descriptions of arrangements of this character, including the plain roller method with upper and lower bed-plates, the pin or pivot also mounted on roller beds, and a "rocker" appliance which is both new and ingenious. These will be described and illustrated in our succeeding article.

THEATRES.—XLV.

By Ernest A. E. Woodrow, A.R.I.B.A.

MUCH has been said and written upon warming and ventilating theatres; but as far as England is concerned, little has been done, especially to provide a scientific system of ventilation in our play-houses, and the little that has been done has only been accomplished within recent years.

The thorough ventilation of a theatre is a hard problem, but it is one where half measures are better than none. In order to avoid draughts, the supply should be in large volume, through large inlets, and the air should not be made to rush through small apertures at a high speed; and corresponding outlets should be provided so that the hot, vitiated air would find its way out.

Warming and ventilating must go hand in hand, for the fresh air must not be admitted so cold as to be perceptible. The heating coils should, therefore, be placed in the vestibules, staircases, entrances, passages, and lobbies, so that as the air travels up these parts of the building from the streets towards the auditorium it is warmed, and does not enter when a door is opened as a chilled draught. The introduction of the electric light has altered the arrangements of our theatres in more ways than one. The abolition of gas has removed the past-favoured method of warming, and a system of heating coils and pipes has been found absolutely necessary in the theatres which now have the electric light. We are, therefore, so much nearer pure air than we were in days gone by, inasmuch as the air is not vitiated by the gas, and being warmed before admission, can be let in imperceptibly in larger volumes than heretofore; and, again, the extracts can do the work allotted to them, and not be enticed into doing the work of inlets.

It is not my purpose to speak of any special system of either warming or ventilating as adapted in England, but only of American or Continental methods. Every building must be treated of itself; the position, number of tiers, number of people, number of doors, &c., are all factors in each individual scheme. Suffice to say that sufficient attention is not yet given to ventilating our theatres, even with our improved methods of lighting. For scientifically ventilated playhouses we must look abroad—either on the Continent, or, in a few instances, in America.

Referring to America, no doubt many of my readers have seen Mr. Dankmar Adler's articles on "Theatres," in the *Engineering Magazine*, New York. Therein he devotes some space to the part of the subject now before us. Real and popular success in heating and ventilating a theatre, he says, is even more difficult of attainment than its lighting and decoration; people consider a theatre well ventilated if in warm weather they are kept very cool, and in cold weather they are kept moderately warm; and he explains that they are little, if at all, influenced by the extent to which the air is actually changed and renewed. "The temperature which people consider respectively warm or cool varies by at least 10 degrees in different individuals at the same time, and is subject to the same range in the same individual at different times under variations of moral and physical condition." Whatever standard is therefore adopted, it will be unsatisfactory to many persons in the audience, and Mr. Adler points out that even after a standard temperature has been determined upon, it is difficult to maintain it, for it will quickly be raised upon coming in contact with the lights and the bodies of the people, while the amount of illumination varies from time to time during the same performance; the number of people in the audience changes nightly; there are variations in the external temperature, and in the direction and velocity of the wind. Bringing the matter to a practical head, this American architect advises that, in designing and operating the heating and ventilating apparatus of a theatre, all thoughts of satisfying cranks and hypochondriacs must be abandoned, and a standard temperature satisfactory to the average healthy human being must be determined upon and adhered to.

The system propounded by Mr. Adler consists of the entire banishment of window openings, and the provision of as many sets of doors (at least three sets) between the street and the auditorium as it is possible to find room for, the warming of the vestibules and lobbies between these doors, and the making of windows and skylights where they exist double or triple so as to prevent the precipitation of excessively cool air into the auditorium. These provisions are to prevent external disturbances. "The fresh-air supply should reach every person in the house, and should be approximately constant in temperature, volume, and velocity; nor should its velocity ever be sufficiently great to make itself perceptible as a draught. To accomplish all of this the ducts for both admission and removal of air must be very large, and the openings from the ducts into the rooms quite numerous and very much diffused."

Mr. Adler does not advocate the admission of fresh air through the floors and the extraction through the ceilings, as he says such air inlet openings become the receptacle for dust; the coolest air is at one's feet, and the slightest excess in velocity is felt as a draught about one's ankles. He prefers to admit the air at the ceilings, and to exhaust it at the floors, to prevent the blowing back into the room of sweepings, and having the warmest air of the room at one's feet. Ordinary disc-fans and pressure-blowers, driven by steam-engines or electric motors, constructed to operate at varying speed, are advocated as best adapted to obtain these ends, as well as the purification of the air by forcing it through water, the cooling of the air by ice or brine, and the warming of the air by heating coils.

Mr. Wm. Paul Gerhard, C.E., in a recent pamphlet upon "Modern Theatres," also dwells upon the subject of ventilation. He deals with it as a matter of "theatre hygiene," and tells how the Boston Building Law wisely prescribes that every theatre must have a system of ventilation so contrived as to provide 50c.ft. of fresh air per minute, or 3,000c.ft. per hour, for each occupant, and for each light other than the electric-light. The old-fashion central chandelier as a ventilator, Mr. Gerhard states, carried with it in more than one instance death and destruction, by creating during a fire a strong current of air from the stage towards the auditorium, thus leading the smoke and fire gases to the upper galleries and suffocating the people. Serious accidents have also occurred through the falling of the chandelier during a performance. Ceiling ventilation must be adopted, but a judicious arrangement of the ventilators and registers is required. The ventilator over the stage (of which I have yet to speak) should, according to Mr. Gerhard, be larger than the combined area of the ventilators in the auditorium ceiling; this, together with the fact that the stage ventilator is almost always higher than the one over the audience, should assure a movement of air away from the audience towards the stage, and to make quite sure of this, it is a good plan to have the vent registers in the ceiling of the auditorium, controlled from the stage, so that in case of fire they will be closed simultaneously with the lowering of the fireproof curtain. The smoke and fire gases will thereby be prevented from passing into the auditorium.

Experts differ in America as elsewhere, for we find the ventilation of the Chicago Auditorium the exact opposite of the principle described above by Mr. Paul Gerhard. Here the general movement of air is from the stage outward and from the ceiling downward. Fresh air, taken from the top of the building, is forced into the house by means of fans, and comes down through a shaft, where it is subjected to the action of a heavy spray to wash it of all impurities of dust, soot, &c. Brine is used for cooling the air in summer, steam coils for heating it in winter.

The ventilation of the Madison-square Theatre, New York, is described, according to Mr. Townsend, as being managed by means of a large shaft on one side of the stage behind the boxes, with a 7ft. suction fan in the basement, which drives the air into four air-boxes supplied with steam radiators, and placed in various parts of the building; from that again small tin pipes lead to openings under each row of seats. Thus, when the fan is in motion fresh air is drawn from a point above the roof, and after being efficiently warmed is driven into the house, to escape, when vitiated, at openings in the ceiling and under the galleries. Fresh cold air is also discharged from the downcast shaft at various other points. In summer the same system is in operation, only in place of driving the air over steam radiators, it is passed over enormous blocks of ice.

In order to show how behind the times we are in England in these matters, I purpose illustrating the manner in which the Frankfort Opera House is warmed and supplied with air fit to breathe in all weathers, before concluding with a *résumé* of the regulations enforced in this respect at home and abroad.

The description of the Frankfort Opera House, and the section illustrating it, I take from a German monograph upon the building.

By far the greater portion of the basement of this theatre, which under the auditorium consists of three stories, is used for the purposes of heating and ventilating after the manner, but on a more elaborate scale it is said, of the Vienna Opera House. The rooms used by the *personnel* of the theatre around the stage, such as the dressing-rooms, rehearsal-rooms, &c., are warmed and ventilated in a different manner to the auditorium. There the heating is done by means of coils placed in window niches, so that as the fresh air from without enters the room it is suitably warmed. By means of a handle fixed in the window board, the supply of air from without can be regulated or cut off altogether, thus allowing the coil to act only on the air in the room. If the air in the room becomes too hot, then the occupants can cut off the steam from the coil by turning off the valve, by which means they can regulate the temperature to their own satisfaction. In the walls opposite the inlets are extract gratings, one near the floor level and one near the ceiling. In the winter the air, being dense, escapes by the lower extract; in summer by the upper one, and is from thence conveyed by flues to the cupola at the top of the building (see section, Fig. 1).

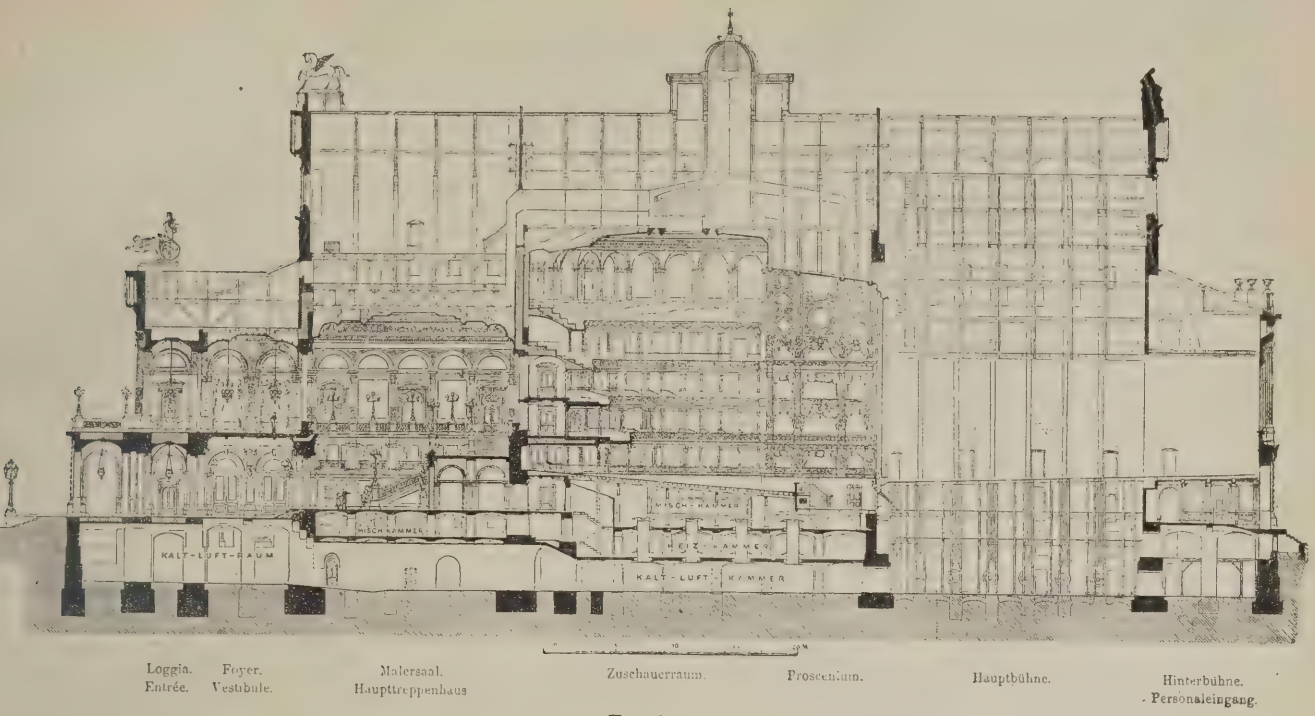

FIG. 1.

The method of warming the various rooms, passages, staircases, and auditory used by the public differs from this method, inasmuch as the air is heated before it enters the room. The Frankfort Opera House seats 2,000 spectators; 40 cubic mètres of fresh air is supplied to each of them per hour. The fresh air is brought into the building by means of a huge fan, which drives it into a collecting-room situated under the vestibule. The air is heated in this collecting-room in winter by passing it over steam coils, and cooled in summer by being forced through a three-fold sheet of water. The fan which causes the necessary 80,000 cubic mètres of fresh air to be drawn into the building each hour is three mètres in diameter, and is propelled by a 15H.P. engine, so as to revolve from 90 to 100 times a minute.

The basement beneath the auditorium is, as I have said, three stories in height; the bottom chamber, as shown on the section, contains the cold air, which rises through large perpendicular hanging cylinders composed of plate iron into the top or mixing chamber. The air also passes from the cold chamber through circular openings round the bottom of the cylinders into the middle or heating chamber, where, after passing over steam coils, it ascends into the mixing chamber simultaneously with the cold air from the lowest chamber. As the cold air passes through the cylinders it hits against a wide cover at the top, and falls over the edge of the cylinders, to mix with the ascending warm air from the centre chamber. The air passes from the mixing-rooms through perpendicular flues to the various rooms and levels of the auditorium, which it enters through gratings fixed just above the floor-level. On the ground-floor seating these gratings are placed in the floor under the seats; but in the tiers above, slits are made in the risers of the steppings, through which the air passes and supplies each individual spectator.

Corresponding with the inlets are outlets, situated in the ceilings above the seats. These allow the vitiated air to escape and be conducted through channels, which unite above the theatre in large conduits, which culminate in a large central shaft below the cupola, and passes through the louvred sides of the cupola into the outer air. A sun-burner in the top of the theatre causes the air to become rarefied, and to rise into a chamber containing heated tubes; thus the air has a constant upward motion, which is further increased by the pressure of the air from below.

If the quality of the inner and outer temperatures in summer requires a further means of expulsion, then it is performed by an exhauster, which is placed close to the cupola, having a diameter of about 3 mètres, and moved by means of a wire rope worked by the engine boiler, and having fifteen more revolutions per minute than the fan below.

In order to facilitate the working of various large valves (some are several square mètres in area) which regulate the inflow as well as the outflow of the air, the machinery of the same is all collected into a central control room. Here the engineer watches the temperature of the different rooms, which is announced to him by electric signals, and he handles the whole apparatus by regulating steam-valves, and the revolving of the fans.

NOTES FROM PARIS.

OVER six hundred applications have been made for the programme of the proposed Exposition of 1900. It is probable that not more than a hundred and fifty or two hundred serious sets of plans will be sent in, for out of the six hundred who have asked for the programme, probably more than half of this number desired the information out of curiosity to see the plan of the grounds devoted to the Exposition, and the instructions to competitors. Again a large number of those who may have commenced plans and designs have since retreated before the heavy expense of properly preparing an important and showy set of drawings, or finding that their ideas do not work out well on paper, have given up the idea of competing. There will be very keen competition between the engineers and architects, who are preparing important sets of plans and façades, for during the four months allowed for the competition a large amount of work will have been gone through, and those who have special ideas of their own for the planning of the Exposition, will have had sufficient time to properly study and work out their arrangements. The day for delivering the drawings is, however, fast approaching, and the large staffs of draughtsmen in some of the Paris offices are now "en charette," the school term for the very busy time as the last day approaches, and hastening on the effective colouring of the plans and most important façades in order to take up the less interesting buildings left to the last, and put in as far as time allows. The date for sending in is the 15th December next. The competitors will certainly be divided into three classes, those who make a clean sweep of the existing buildings remaining from the last Exposition in order to proceed on perfectly new lines of plan and arrangement; those who are perhaps more prudent and who preserve all the important buildings, altering their façades in order to change their aspect, adding new features and smaller buildings, and changing the arrangement of the grounds; and lastly, those who destroy some of the existing constructions and utilise others. The first class will almost certainly have the most followers, for the school traditions and habits of the Parisian architect make him dislike all rearrangements of existing constructions which may hinder him from planning on perfectly classic lines, preferring to be entirely free as regards space and plan, endangering often cost and practibility. It is not, however, at all certain that the premiated plans will be from amongst this class of competitors, for although the Exposition committee desires an arrangement as classic and grandiose as possible of plan and façades, doing away with many of the inconveniences of the last Exposition, at the same time it is probable that the question of economy will be largely entered into, and the spending of several hundred thousand pounds for pulling down an existing building, and the erecting of another more monumental, but perhaps not more useful, be avoided as much as possible. Several of the competitors will probably not hesitate in proposing the demolishing of the immense Machine Gallery, if it in anyway interferes with their intended planning. The spacious galleries of fine arts and liberal arts may possibly be pulled down, the Trocadero will certainly be much enlarged, and the Eiffel Tower, which will be in the way of a number of competitors, may possibly be transported by them to some other part of Paris; but as an indemnity of £400,000 would have to be paid to the owners if the tower was demolished, it will probably remain in its present place. The Palais de l'Industrie in the Champs Elysées, where the annual Salon is held, is assuredly the "bête noire" of most of the competitors: they are undecided whether to leave this building as it is, or to destroy it in order to erect in its place a more modern and elegant construction. The programme does not afford any hints on this subject: it is entirely left to the competitors to do what they think fit with any or all the existing buildings, excepting the Trocadero, on the site for the Exposition. Each competitor must therefore form his own opinion on the matter, and decide for himself whether the committee intends to spend five or six hundred thousand pounds in demolishing the existing Palais de l'Industrie, and in constructing a new building. The programme asks also for a broad bridge over the river in front of the Invalides: a number of the competitors will probably propose to cover the river along a large portion of the Seine, passing through the Exposition grounds. The public exhibition of the drawings will take place towards the beginning of the coming year, and will be very interesting. The present difficulty is the finding of galleries large enough for the exhibition of the many sets of drawings, for each competitor will send at least ten or twelve stretchers; the Palais de l'Industrie is the only available place large enough at Paris, and this building is occupied for some time to come by various exhibitions. The sub-committee of the Exposition is now meeting to go through the report, presented by the secretary, concerning the numerious ideas which have been received from private individuals for arrangements and "clous" for the year 1900. Some of these ideas are very interesting and deserve attention; but many of them seem to come from persons of unbalanced mind, so strange and grotesque are they.

An army of workmen is now busy at the cathedral of the Sacré Cœur at Paris, on the construction of the large dome, which is completed as high as the cornice. The interior and exterior cupola will be completed next year; the former will be situated at 165ft., and the latter at 270ft. above the paving of the cathedral. The completion of the campanile will take longer, and will not be finished before 1896, its elevation of 400ft., added to the height of the "butte" on which the edifice is built, 800ft. in all, will make this campanile the chief point of Páris. The offerings towards the erection of this commemorative monument amount up to the present to twenty-seven million francs.

The magnificent buildings of the new Sorbonne are rapidly nearing completion; the portions lately finished comprise the chemistry laboratory of forty rooms, and the physical laboratory, a gallery 225ft. long. In this latter laboratory a cage 250ft. high has been constructed for experiments on falling bodies. A well 110ft. deep below the ground floor of the building forms a portion of this cage. Rooms at the bottom of the well are connected by means of the telephone with the laboratories above. The decoration of the new buildings has been intrusted to the well known artists, Dagnan Bouveret, and J. Weerts: the former will undertake the painting decorating of the fine amphitheatre of letters, and the latter will paint an immense panel for the court of honour.

M. Homolle, director of the French school at Athens, informs the Academy that the excavations at Delos are giving very good results, and that very soon a complete description of the second century Greek house will be given. The musical inscription discovered in the Athenian treasury shows signs of musical notation: it is engraved in two columns on a marble tablet, and will therefore be very easy to reconstitute. The poetry is a development of the story of the birth of Apollo in the island of Delos, his arrival at Delphos, and his victory over the serpent, ending with a prayer for the city of Athens, and for the Romans, thus permitting the date of this inscription to be fixed as being at the end of the second century.

The Exposition of the Flower, which is being held at Paris, is an original and interesting effort at this moment when all attempts are being made to deliver decorative art from its Classic bonds. The organisers appealed to artists and collectors of modern and ancient art, desiring all pictures, objects, furniture, drapery, &c., where the natural flower is reproduced. All fine arts and decorative arts were thus appealed to, painting, sculpture, ceramic, metal-work &c., and examples of art work of all kinds abound in the galleries of the Rue de Seze. The object of the exhibition is to give a proper impulse to the evolution of industrial and decorative art, putting aside the imitation of old styles, and seeking in Nature herself elements which an intelligent interpretator should transform into artistic reproduction.

The inaguration of the small monument to Felix Duban took place a few days ago. It is placed in the vestibule of the hemicycle of the Ecole des Beaux Arts, on the threshold of the building which Duban loved so much, and which he made it his lasting joy to decorate. This monument is rather a tardy souvenir of the admired architect. Born at Paris in 1797, he became architect to the Ecole in 1832, and professor of one of the school studies, following up his work and studies until his death in 1870 at Bordeaux. During his stay in Italy as laureate of the Academy of France, he published many interesting studies on the Tuscan monuments, and on the ruins of the tombs of the old cities of Etruria.

The monument consists of a bust of Duban on a bracket of white marble supported by the Genius of Art, symbolised by a beautifully graceful figure of a child. The bust stands out against a background of while marble relieved by fine mosaic work, and gold laurel branches. The author is M. Eugene Guillaume.

The death at Tours of Leon Palustre has deprived France of one of her best known and illustrious archæologists of French Renaissance. His work on the Renaissance in France is world known and treasured by all architects and artists.

At the Ecole des Beaux Arts the principal competition for the month was that for a hospital or almshouse for old people. This almshouse should be large enough to receive 160 old people of both sexes. Before the entrance should be two buildings destined for the dwelling of the director and that for the sisters of mercy. The principal building should comprise, on the ground floor, a general room, two workrooms, two dormitories with lavatories, &c., two refectories, kitchen and offices, a chapel and adjoining sacristy, an infirmary, and drug room, staircases with lifts. Two dormitories, dwelling rooms, a library, and a gallery overlooking the chapel should comprise the first floor, the second floor being reserved for the rooms of the assistants. This was the programme for the holiday work. The plans and façades of M. Hurtré, to whom the first medal was awarded, were excellent, although rather too Classic and monumental for such a building. The competition sketch for the month was a monument to M. Carnot at Lyons. A great simplicity, something of the men-hir of olden times, should characterise this monument, a simple stone, 15ft. high, roughly hewn, with simple lines and sentiment, the story of the crime engraven thereon, the date of the birth and death. No medal was awarded in this concours, for such severe simplicity was beyond the imagination of the competitors, whose designs were much too elegant and elaborate.

Some very interesting excavations have been made at Vezelay, in the Yonne department, during the course of the work of leading water-mains into this interesting old town. In the centre of the town square the legendary well has been opened up. This well, excavated in the rock during the time of the religious wars, and closed up since, is 17ft. in diameter, and attains a depth of 230ft., having on its coping a very fine railing of wrought iron decorated with the French fleur-de-lis and porc-epic, the arms of the town. On the top of the hill before the famous church a large quantity of bones of the victims of the civil wars and of the famous siege of 1569 have been discovered, and behind the church a number of complete skeletons, in a perfect state of perservation, arranged methodically and separated by flat stones forming coffins, are probably those of the monks of the old abbey. A large quantity of coins of different epochs, from the time of the Romans up to the last Bourbons, has been discovered. All the most interesting of the objects found have been placed in the town museum of Vezelay.

Remnants of frescoes of vaults have just been discovered at Poissy in an old chapel, now converted into a barn. La Maladrerie, a hamlet of Poissy, was from the time of St. Louis used as a refuge for lepers. The chapel dates from this epoch, and was already falling into ruins when converted into a barn. The frescoes, which are not in a very good condition, are, however, very interesting, as containing certain portions in which figures of remarkable colouring are still visible.

The inauguration of the siphon of Clichy has just been made by M. Barthou, Minister of Public Works. This famous siphon is that which plays an important part in the new scheme of Paris drainage. The visitors descended by the air-hole of Asnières, passing under the bed of the Seine, into the town works of Clichy. During the visit the chief engineers explained the object and use of this immense siphon, and the visitors had the opportunity of witnessing a series of miniature luminous fountains which had been arranged at 80ft. below the bed of the river Seine. M. Berlier, the chief engineer, was decorated with the Legion of Honour by the Minister of Public Works.

The Academy of Fine Arts, at its yearly public meeting a few days ago, awarded the following prizes to the laureates of architecture for 1894. Prize of £60, founded for the encouragement of young architects showing ability in their art, to M. Dumesnil; the Leprince prize was awarded to M. Recoura; the Leclerc prize, £40, to M. Rey, the subject being a sacristy; the Lusson prize, of £20, delivered each year to the student laureate of the 2nd Prix de Rome, to M. Patouillard; the Delannoy prize, of £40, to the laureate of the Prix de Rome, to M. Recoura, the prizewinner of this year; the Pigny prize, of £80, to M. Patouillard; the Bailly prize, of £60, to the architect of the most important work of the year, to M. Hardy, for Notre Dame de Lourdes; the prize of the school, to the student who has carried off the most medals in the competitions, to M. Recoura; and the Jay prize to the laureate in construction, to M. Huillard.

The Prefect of the Seine has been authorised to make the following purchases of land for the spreading of drainage matter, in view of the new sanitary law at Paris. Lands at Achères, Triel, and Poissy, to the value of £50,000, together with a heavy indemnity to the company of waste-water from the city. The opposition met with from the various communes near the spreading ground has in most cases been overcome, so that now there will be little difficulty in accomplishing the important work of entire drainage during the delay fixed by the new sanitary law.

The metropolitan railway for Paris is being seriously discussed, and doubtless will very shortly be decided upon, for it is desired to complete this work in time for the Exposition of 1900. ARTHUR VYE PARMINTER.

Paris, Nov. 14.

A SPECIFICATION ANNOTATED.—II.

9. — *Sanitary Authority.* — The builder must deposit a copy of the plans with the "rural sanitary authority," and obtain its approval of the same in writing before the work is commenced. Any fines levied on the building owner, or expenses incurred in altering work through the builder's neglect in this respect, shall be discharged by the builder, and will be deducted from any balance due to him at the final settlement.

A sanitary surveyor in a rural district may be a broken-down farmer, shopkeeper, or auctioneer; his knowledge of building work will, therefore, not be profound. This will not, however, prevent his formulating his views in dogmatic terms, and as his employers (the guardians) are mostly men of the same stamp as himself, so far as a knowledge of building goes, they are always ready to sustain him in any attack on the builder, no matter how idiotic. It is quite true there is an appeal to the magistrates, which comes on when the builder is summoned to some police-court to be dealt with as the law shall determine. Now it may not be generally known that a man is raised to the bench (magisterial, not joiner's) without having previously passed the Institute examination, or even having read "Is Architecture an Art, or is it Worked Successfully by 'Eminent' Architects as a Trade?" His knowledge of building must, therefore, be represented by —0: hence it is no wonder that magisterial rulings on this subject have so frequently a fine New Southgate flavour, and so seldom deserve the respect which they have such an unpleasant way of commanding.

In many instances the builder is no doubt justly overhauled by the powers that be; but there are cases in which the surveyor, not being treated with the respect he considers to be his due—and his importance generally bears a direct proportion to his ignorance—proceeds to make it "hot" for the builder. It will be found advisable under all circumstances to agree with the surveyor whether he is right or wrong, and this as promptly as possible, for it will save trouble, annoyance, and expense. But if the builder is a novice, and allows his temper to get the better of his judgment, then, after kicking against the pricks and submitting to the inevitable, he will find a salve for his wounded spirit in Herbert Spencer's "Coming Slavery," and in Matthew v. 25, 26, where he will find the best possible advice to him under similar circumstances. This specification, and its notes are nothing if not practical. The foregoing remarks on sanitary authorities and surveyors are very general. Now for some cases in point. A builder in a certain locality, not a town or village, merely a rural district, and that not 100 miles from London, decided to do away with his draw-well and bucket and lay on an "installation" of pipe-water instead. The drainage of the entire locality was effected by means of cesspools in the chalk. These were sunk about 20ft. deep, 12ft. or 14ft. in diameter at the lowest part, and tapered up to a manhole above. Such receptacles were in use in the locality "from the time of Adam," and the inhabitants appeared to get on fairly well with them and to be utter strangers to all those fancy ailments that come into being with sanitary surveyors. In this instance, as pipe-water from the waterworks three miles away was now laid on to the premises and to all other premises in that locality, the builder naturally thought it a good idea to turn the w.c. drainage into the disused well. He argued thus: "There is a cesspool already in the garden, there are several in this locality, one at least in every garden. Moreover, they are all comparatively shallow. This cesspool will be 80ft. deep against 20ft. in the others, and no greater harm can result from this than if a new cesspool is dug, and against this there is no by-law." The reasoning appeared to be unanswerable, and the builder proceeded to connect the w.c. apparatus with the disused well. But now the sanitary surveyor appeared on the scene. He inquired if it were really the intention to turn the soilpipe drain into the well? and on being told it was the intention to do so, he at once bristled with notices, legal and illegal, and warming up with indignation at such a horrible proceeding as this desecration of a well with sewage, he finally served the builder with a summons to appear before the magistrate "to be dealt with according to the law as this case made and provided." The poor builder pointed out that though it was intended to pour sewage into the well, it was not contemplated to draw any drinking water out, as pipe-water had been laid on! But the surveyor's heart was hardened: he would have no desecration of wells in his district, and the work was discontinued. What was to be done? On thinking the matter over, the builder recollected that another builder in the same district had a near relative on the board of guardians from which the sanitary authority had been drawn. This person was naturally one of the surveyor's employers. What if this builder was employed to connect the drains with the well? Builder No. 1 communicated with builder No. 2, and, without stating any reasons, asked him to continue the drainage work so recently abandoned. This No. 2 promptly did, without let or hindrance from the surveyor; in fact, it was now discovered that the proper thing to do was to connect the closets with the disused well. It made a good cesspool, and a much safer one than the others on account of its greater depth! The moral of this tale is, of course, that a builder in a rural district should be a poor law guardian, or should have a near relative on the board, and thus comply with the sanitary authorities' *unwritten* by-laws! Yet one more instance to illustrate this paragraph No. 9:—In a village of from 300 to 400 people, a house was being built with materials in every respect sound and satisfactory, and to plans deposited with, and approved of, by the sanitary authority. This particular house was rather a large venture for the village in which it was built, and the owner had the house so designed that if he failed to let the building as a house to one tenant, a slight structural alteration would have divided the house into two, each a copy of the other, and, of course, capable of being occupied by two families. The alteration was to be effected, if required, by closing up some large openings left in what would be the party-wall. The roof was all but completed, when the owner was served with notice by the sanitary authority, that the by-laws required him to raise the party-wall through the roof of the "two houses." The owner replied (1) that there were not two houses, but one house; (2) that there could not be "a party-wall" in that house; (3) that the sanitary authority approved of the roof plans, which showed no such wall; and (4) that if the house was at any time divided into two separate houses, and a party-wall built, then, and not till then, would the owner carry such party-wall up through the roof. In this particular case, this raising of a wall through the roof affected the wall in the centre of this building only, for one gable stood completely detached by 12 or 14ft. from any other building, and the other gable rose from 10ft. to 12ft. above the adjoining and abutting roofs. The sanitary authority would have none of these excuses—the surveyor had been rubbed the wrong way—and they insisted that the roof should be reconstructed. The owner was determined he would not comply with their demand, as he had both law and justice on his side. He, however, hadn't the magistrates on his side, and they ordered the work to be done at once, to the surveyor's satisfaction, failing which a penalty of £7 per week was to be levied on the unfortunate owner for every week the order remained in abeyance. These men actually decided that the sanitary authority could, if they pleased, at any time during the progress of the works, withdraw their approval of plans given before that work commenced, and make, through their surveyor, any order they pleased! As the only appeal against this idiotic decision lay at the quarter sessions, and as the prosecuting of such an appeal would be more costly than reconstructing the roof, the latter alternative was adopted. This building now stands a monument of magisterial imbecility and official spite, with a party-wall separating rafters at one side from rafters at the other side, whilst the whole building below is divided into a number of apartments shut off from each other by ordinary wooden doors, no party-wall existing except in the roof! It is a singular fact that within one hundred yards of this house another house was being erected, at the same time, under the same sanitary authority, which contravened that authority's by-laws in the most flagrant manner, the whole roof being of boards and felt only—no tiles or slates. Yet no notice whatever was taken of this, probably because the owner was a good fellow, who kept a good table, and was rather generous with a good, drinkable beer! The moral of this is: Before a building is commenced in any rural sanitary district, invite the authority to "sample" the beer, or test it for microbes; if wine is preferred, a sample may be tried on the premises, and a few samples taken for analysis in sealed bottles, as required by law. It must be distinctly understood that these remarks do not apply to every establishment of sanitary authority, with its clerk and surveyor, but the cases mentioned have occurred, and may occur again; therefore the builder—and in the expression "builder" is now included the owner and architect—must be careful not only to comply rigidly with the by-laws, but will also pay all due respect to the authorities' officers, and to order himself lowly and reverently to his betters, that his ways may be ways of pleasantness, and his paths paths of peace. In London certain fees are payable to district surveyors working under the Metropolitan Building Act, a copy of which may be seen in every price-book; but, as a rule, no fees are payable in the provinces for approval of plans or inspection of works in progress by any public authority.

10. *Lay on Water.*—Lay on water from the company's mains to the site of the mortar heap. Pay all charges for same, and for the subsequent use of water. Make good the road and path after the pipes are laid. The stand-pipe and tap are to be cased with straw or felt to prevent damage in case of frost, and should either be injured by frost or otherwise, the pipe or tap so damaged must be renewed at once, and a new one substituted.

It is no uncommon thing to see a tap or pipe burst by frost leaking to such an extent as to flood the entire space occupied by the mortar heap, thus drowning the lime, and converting the mortar into slush. This should not be allowed. The workmen will not be anxious to remedy this defect, for the more water the less labour required to mix, or properly temper the mortar. The water may be paid for by measure, so much per thousand gallons, and registered by a water meter, or so much per rod of brickwork in the proposed building. Of course, if there is no public water supply, a well must be sunk and provision made for a windlass and buckets, or a pump. This well should be sunk in such a position that it will be available for the house supply, and this will be vertically under the pump, whether in the scullery or elsewhere. The workmen cannot have too liberal a supply of pure water for their own private use, but the less the mortar gets the better.

11. *Provisions in Cash.*—Where sums of money are provided in the specification for the purchase of grates, mantels, ranges, or other fittings, the sums are net sums—i.e., net to the trade, and from which the builder is to derive no profit or discount from the manufacturer. He will, therefore, add in his estimate to these net sums:—(1) For profits on the goods as in the way of trade, (2) for carriage to the building, (3) for fixing complete in the building, (4) for risk of breakage in transit, (5) for use of packing-cases, and (6) for returning same to the manufacturers carriage paid; and the said sums must be held at the architect's disposal to the full amount stated without deduction of any kind.

The Building News Intercommunication Column has from time to time afforded ample evidence of the necessity of this clause being made plain to the densest understanding, and it is marvellous how dense some people—especially builders dealing with such provision clauses—can be at times. It would appear that the most satisfactory and businesslike way to deal with these provisions would be to omit the net sums altogether from the contract, and let the architect inform the client of this fact, handing him at the same time a list of the fittings meant to be supplied, and the net cost of same, with an intimation that the gross amount must be expended to complete the work, but that it is not included in the builder's estimate. There is one objection to this plan—viz., the client would know too much, and this, under certain circumstances, may not be good for him, the architect, or the builder.

12. *Access to Plans.*—The architect shall always have access to the buildings, and all plans, specifications, and other documents connected with the works and furnished by him shall be kept in an office on the site for his inspection when required. No marks in pencil or otherwise, or alterations of any kind shall be made on such plans or documents, and these shall be properly preserved and delivered up to the architect on completion of the works.

The best way of preserving plans for reference or use on a building in progress will be to mount each plan—"plans" meaning sections and elevations as well as ground and other plans—on a board; yellow pine from $\frac{1}{4}$in. to $\frac{1}{2}$in. thick clamped being lightest and best for this purpose. No measurements by scaling should be made from plans so mounted unless the scale is first drawn on the plan so that it may shrink and expand with the drawing. Some architects merely write $\frac{1}{8}$in. scale or $\frac{1}{4}$in. scale on the plan; but in all cases it will be found advisable before commencing any drawing on paper, mounted or unmounted, to draw the scale at the bottom of the sheet, and lay off all dimensions from this with the compass. The scale will then be correct for the drawing, and the absurd mistake avoided of placing a $\frac{1}{2}$in. scale on a drawing to a 1in. scale, or vice versâ, an error which has frequently been made, especially when a drawing is taken up hurriedly after being put away without the scale being indicated when the drawing was commenced. When, however, the scale is worked to on an unmounted sheet, it is not always safe to take dimensions from the drawing by the scale after the sheet is mounted, for the paper pulls irregularly in drying, and straight lines on an unmounted sheet will sometimes be very crooked lines on the same sheet when mounted. Some provision should be made to protect drawings from rain when being referred to, and worked from in the actual work.

13. *Charge of the Works.*—During the progress of the works the builder must be constantly on the ground during working hours, or, in his absence, the building must be left in charge of a properly qualified foreman as the builder's accredited representative.

Nothing is more provoking to the architect than to go on a building and find no person in charge; the builder may be a man given to subletting, in which case he will probably neither look after the work himself nor keep a foreman to do so. An important addition may therefore with advantage be made to this clause thus: "No sub-contractor shall be considered a foreman within the meaning of the clause; the builder's representative must be either a paid clerk or 'day's work foreman.'"

14. *Piecework.*—No piecework will be allowed except by special consent of the architect to be obtained in writing. The name and address of the proposed sub-contractor to be furnished to the architect before any work is sublet. In every case the architect will furnish such sub-contractor with the plans, specification, and quantity relating to the trade of such sub-contractor, and the builder shall pay for preparing the same.

This is an unusual but very important provision. It is quite a common thing for a builder to sublet work, and entirely misrepresent the nature and quantity of the work proposed to be done, in which case the architect finds himself obliged to withhold his approval from the sub-contractor's work; the latter may at the same time have performed the work in strict accordance with his agreement; but that agreement was not quite in accordance with the architect's drawings and specifications, and was purposely made so in order to obtain a low price for the work. If the provisions of this clause are carried out, and the sub-contractor placed in a position to know what the architect requires independently of the builder, then if he "scamps" the work, he has no one to blame but himself when that work is condemned. As for the general question of the advisability of permitting "piecework" on a building, it may be assumed that piecework need not, and, as a matter of fact, is not, generally speaking, inferior to daywork; and when in any particular case it is attempted to scamp the "piecework," the architect should be in a position to take care of himself and his client. The whole contract is a piecework contract, and there is no reason why a system, if good in bulk should not be good in detail. In practice a piecework man will be found to take more interest in his work than a "daywork" man.

15. *Bad Work.*—Should the architect discover that work is being improperly done, or materials supplied which are not in conformity with the drawings and specification, he shall deliver to the builder, as soon as possible, a statement in writing of such departure from this contract, and should the builder consider that the architect's requirements are arbitrary and unreasonable, he shall, within 12 hours of the architect's complaint, forward to him in writing a statement of his objections to the architect's views; and if on consideration of the builder's statement the architect still persists in his opinion, or if the builder neglects to furnish any objection as herein provided, then the architect's decision shall be final and conclusive. All work done, and declared unsound, and not according to this contract, shall be taken down, and the defective materials removed off the premises within seven days of date of the architect's notice, and all work actually in progress at the time of delivering such notice shall be stopped at once, and any neglect of this condition shall render the entire contract null and void.

There is a strange superstition held by many, workmen and others, that an architect can go on to a building and pull down and destroy, or order to be destroyed, any defective material he may object to; but he has no right whatever, under any ordinary contract, to do anything of the kind. This conduct would be grossly unjust to the builder, and strangely undignified for the architect. An appeal to the County Court by the builder would teach the architect that, no matter how objectionable some building materials may be to him in any particular instance, he has no right to destroy the property of others. The architect can order its removal within a specified time, and this method of dealing with the matter will be the most equitable for all parties concerned. Nor is there anything to be gained by adopting an offensive and bullying manner, for any and every infringement of the contract. A loss of temper, and, with it, the loss of ordinary common sense, will be entirely avoided by adopting the method prescribed in this clause; and, in addition, a record in writing of the entire transaction will be preserved for future use.

OLD ENGLISH COURT AND LIVERY CUPBOARDS.

[WITH PHOTO-LITHOGRAPHIC ILLUSTRATIONS.]

THESE drawings, by Mr. William Bliss Sanders, are taken by permission from his handsome new folio, which has just been published under the title of "Half-Timbered Houses and Carved Oak Furniture of the 16th and 17th Centuries,"* with thirty full-sized plates in uniform character with the author's original volume on the same subject issued under a similar title a few years ago. The scale adopted is in all cases to a sufficient size to enable a workman to imitate the details of the furniture and inlay-work represented. Our reproductions which accompany this notice are necessarily reduced in size to accommodate the proportions of our pages. The drawings are considerably larger in Mr. Sanders's work. All his specimens are believed to be of English manufacture; but no precise opinion as to the date of some and the nationality of others can be made with any degree of certainty, as not infrequently British workmen copied foreign examples, and besides, the same design, with but slight variations, was repeated time after time all over the country, few types of make being really confined to any particular district or county. The sturdy, and even coarse, style which marked the furniture, particularly of this period, usually known as the Jacobean, had the advantage in a general way of being honestly constructed with its ornament, however crude it may be in some cases, made subservient to it structural lines, for the Old English workman naturally followed his Mediæval predecessors, and the Gothic tradition still permeated, to some appreciable extent, the vernacular style of the day. The oak grown in this country too, always very hard, presented difficulties of manipulation, to say nothing of its liability to cast, shrink, and split, and so rendered delicate details and small, scaled parts, as well as intricate construction, a matter of no little trouble, and likewise a test of skill, so that the joiner and cabinet maker had every reason to keep to elementary forms and simple outlines. The foreigner, always more fanciful in his predilections, wrought also in a material which permitted more scope and was easy to carve and shape. He, too, had richer models preserved to his hand, and he worked with no such limitations as those which governed the more prosaic craft of his English neighbours. The civil wars and the troubles peculiar to those times on this side of the channel had largely obliterated the traces of old tastes, and appreciation for the elegancies which marked the every-day articles in use during the Tudor period, and when less unsettled times permitted more prosperity, merchants and others, whose ideas were enlarged by travel, imported foreign work of great interest and beauty, such as we still find existing at Yarmouth, Oxford, Bristol, and other places, more particularly in the Eastern Counties. Of half-timbered houses no endeavour is made by Mr. Sanders at anything like a comprehensive series of specimens; indeed, his four examples are all located in Kent, so that since the time when the late Mr. Habershon issued his rather poor volume of drawings, more than half a century ago, it may still be said that no serious attempt to illustrate such buildings in a systematic way has been realised. The typical Kentish cottage, such as that which our present author has sketched just below the mill in the odd little village of Leeds, dates from a much earlier period than the 16th or 17th centuries named on his title-page. There are several similar examples still standing in a more or less altered condition in various parts of the county, and even this capital instance of its class at Leeds has at some time or other been shorn of a considerable portion of its original extent. The old house at Pluckley, one among many in the same village, is different in the arrangement of its façade, with the eaves-line broken into to light an upper window. The roadside cottage near the village of Leeds is a plainer example, with the roof-space still retained as a loft, while the house at Lenham, built at a later period, possibly in the days of James I., has two gables, with enriched bargeboards in the front, besides those at the end of the building, the chimney-stack rising in the centre. Among the wainscoting which figures in the book, are good examples from Norwich, Exeter, and Lincolnshire, and chairs, chests, tables, sideboards, and settles from a variety of places. We have chosen two or three specimens, which may be taken as fairly typical of the remainder. The larger example figuring on our lithographic plate is a Court Cupboard in an hotel at Tunbridge Wells, and on it stands a distinct piece of furniture once known as a Bedroom Livery Cupboard. The two have been fastened together, as shown by the sketch, and generally have been thought to form one article thus designed, for no one had any recollection of their having been separated. About 30 years since they were bought at a sale of furniture of a then Duchess of Kent, in whose house they had long stood as they do now, and no doubt a Livery Cupboard was usually for that matter placed upon some shelf or other piece of furniture, and not upon the floor. The Court Cupboard is 4ft. high, and the smaller one measures 2ft. 7in. The two other cupboards shown on the sheet stand in a recess in the south aisle of St. Alban's Abbey, Herts; but once upon a time they, too, no doubt were bedroom Livery Cupboards. Both are still used for their original purpose of holding food, seeing that charity bread is stored in them before its distribution on Sundays. The fund which provides for this bounty was founded in the year 1628, and it is probable that these cupboards were given to the Abbey church at the same time. The upper one is of Elizabethan date, and the lower one belongs to the Carolian period. In the contracts for the "joyners' work" at Hengrave Hall, in Suffolk, the Livery or Service Cupboards are thus specified:—"Ye cobards they be made ye facyon of livery yt is without doors." Carpenters usually constructed these fitments in three stages, or shelves, with mostly a drawer for linen. The mugs or cups in them were hung on hooks, and frequently a basin and ewer formed part of the Livery Cupboard furniture for washing the drinking vessels therein located when not in use. The volume is thoroughly well printed, and very prettily bound in a suitable cover.

COMPETITIONS.

KING'S LYNN.—No less than eighty-three designs have been received for the Municipal Buildings about to be erected at King's Lynn. Two premiums of twenty and ten guineas were offered for the first and second selected designs, and no professional assessor was promised—or, indeed, has been elected—to help the corporation in making a suitable choice. The chosen plans are to become the absolute property of the promoters. The cost was limited to £3,500. The accommodation is to consist of a council chamber, a mayor's parlour, a committee and magistrates' retiring-room, offices for the town clerk and engineer, and also rooms for the accountant and sanitary inspector. No undertaking is given to carry out any of the plans. The committee have ordered the designs to be exhibited to the public in the ball-room of the Guildhall, where they have been, and are still, open to inspection.

NEWCASTLE, COUNTY DOWN.—We understand that the Directors of the Belfast and County Down Railway Company are inviting competitive designs from architects, for the proposed new hotel at this favourite watering-place, and offer three prizes of £100, £75, and £50, in accordance with the respective merits, for the best designs. It is intended to expend a sum of £25,000 on the hotel buildings. Mr. Alfred Waterhouse, R.A., is to act as assessor.

NEW YORK.—Our old contributor, Mr. George Ashdown Audsley, and his brother, Mr. William J. Audsley, architects, formerly in practice in London, and now of New York, have brought suit in the United States Circuit Court, against the City of New York, claiming one hundred and twenty thousand dollars for "services in designing, furnishing, and delivering plans for a contemplated new municipal building." This is the first suit brought by architects in consequence of the abandonment of the scheme, for which competive designs were invited some eighteen months ago; but it is said that other similar ones will probably be brought.

CHIPS.

The Mersey Docks and Harbour Board have finally adopted the scheme which has been before them recently to provide lairage accommodation for foreign cattle at Seacombe in place of the establishment at Birkenhead. The scheme involves a cost of £400,000, and will require Parliamentary sanction.

In the case of Arthur George Barley, Dynevor-road, Stoke Newington, N., builder, the discharge has been suspended for two years, ending Oct. 5, 1896; and in that of George Beaumont, Chelmsford, builder, the discharge has been suspended for six months, ending April 15, 1895.

Her Majesty inspected at Windsor, on Friday, a new carpet made in India purposely for the Waterloo Chamber, and which is the largest ever made.

For the pier about to be constructed at Bangor, the city council have, on the advice of Mr. Webster, C.E., the engineer of the scheme, accepted the tender of Mr. Thorpe at £14,445. Mr. Thorpe is building the pier at Llandeillo-yn-Rhos.

A vicarage and Sunday-school are about to be added to St. Jude's Church, Savile Park, Halifax, from plans by Messrs. Horsfall and Williams, of that town.

The Bolton Corporation were prosecuted, on Friday, by the Mersey and Irwell Joint Committee for river pollution. It was stated that the Bolton sewage effluent was very bad, being worse than that of Salford. For the corporation it was contended that as they were embarking upon a sewage scheme costing £75,000 the prosecution was unnecessary and unreasonable. The magistrates made an order for abatement within twelve months, and imposed a nominal penalty.

GALLERY AT KNOLE, KENT.—CARTOONS FOR WEST WINDOW OF ST. SAVIOUR'S, SOUTHWARK.—CXVI. LAMBETH WALK. —PROPOSED THEATRE, NEW CROSS ROAD, S.E.—XXXI. CANNON STREET, BIRMINGHAM.—OLD CUPBOARDS.—ST. MARY-LE-STRAND PUBLIC HALL AND PARISH LIBRARY.—THREE COURTYARD STAIRCASES.

Our Illustrations.

THE GALLERY AT KNOLE, KENT.

This admirable drawing, by the late Joseph Nash, is now in the Picture Galleries at South Kensington Museum, and is the property of the nation. No more choice example of his masterly style can be produced, although it is, perhaps, less precisely delineated than some other of his interiors in matters of detail. The subject itself is specially charming, and as a specimen of admirable plaster-work cannot be surpassed—not so much for richness of form as for suitability of scale and harmony of design, adapted to the space to be covered. Artistically the arrangement of the figures, the suggestion of distance, *e.g.*, by the nine pins with which the children are playing, and the disposition of the lights and shades of the picture, leave nothing to be desired. Our reproduction is taken direct from the original, which differs materially from the lithographed copy published in Nash's great book, "The Mansions of England in the Olden Time." We have given several illustrations of Knole; but this long upper gallery has not been before illustrated in any architectural journal, and no one is allowed to sketch inside the mansion. We published Nash's view of the staircase in the Building News for August 20, 1886, and a photograph of it appeared in our issue for Sept. 5, 1890. Two interiors figured in our pages Nov. 23, 1888, and a drawing of the "Stone Court" will be found among our plates for Feb. 16 this year. The history of the house has been several times referred to, with an account of the Sackville family, who have owned the place for centuries.

CARTOONS FOR THE WEST WINDOW OF ST. SAVIOUR'S, SOUTHWARK.

The west window of St. Saviour's Church, Southwark, is illustrative of Creation and Praise. I have represented the Six Days of Creation in the six circles, which catch the eye from any distance and give the key to the whole design. Under each of these are symbolical figures especially illustrating verses from the beautiful hymn, "O Omnia Opera," which refer to the work of each day; these, with the circles, fill the whole central mass of the window. In the centre light Christ is seated as Creator Mundi, with the universe in His hand, and the first verse of Genesis in large letters below. On either side are seraphs, singing "Holy Holy, Holy, Lord God of Hosts," and above is a group of cherubs. At the base of the lights, as a predella to the whole, is a row of figures which represent people who have been noted for their hymns of praise. Under the first day the square panel represents Nights and Days: Day, in rosy light drapery like clouds at sunrise; Night, closely shrouded in dark indigo mantle, holds a child in her arms asleep. Under the second day, when the firmament was created, are the Winds of God going out to the four corners of heaven. Under the third day, Showers and Dew, are watering the "green things of the earth"; the fourth shows the Sun and Moon; the fifth, Seas and Floods; and the sixth, Children of Men, those in the centre being the three children in the furnace, to whom the hymn "O Omnia Opera" is attributed.

Henry Holiday.

CXVI. LAMBETH WALK, S.E.

These corner premises are now in course of erection for Mr. George Evans, from plans and under the supervision of Mr. W. M. Brutton.

PROPOSED THEATRE, NEW CROSS ROAD, S.E.

We publish an elevation and ground plan of a theatre proposed to be erected on a narrow and deep corner site in New Cross-road, S.E. Mr. W. M. Brutton, 171, Queen Victoria-street, E.C., is the architect.

XXXI. CANNON STREET, BIRMINGHAM.

These premises consist of professional offices and printing offices for Mr. John Feeney, the proprietor of the *Birmingham Daily Post and Mail.* Besides the frontage to Cannon-street, shown in the view, there are frontages to Cannon-passage and Needless-alley in the rear, and of similar character. A large amount of steel-work inclosed with concrete is employed in the construction in order to keep the basement, which is one large room, as free as possible from obstructions to the printing machines. The front bricks have been supplied by Messrs. King and Co., Stourbridge, Hollington stone being used for the ground story and dressings, and Welsh green slates for the roof. The whole of the works will be completed about Christmas. Messrs. Bateman and Bateman, of Birmingham, are the architects.

OLD ENGLISH COURT AND LIVERY CUPBOARDS.

(See descriptive article on page 712.)

ST. MARY-LE-STRAND PUBLIC HALL AND PARISH LIBRARY, DRURY-LANE.

This building has been erected out of funds arising from the St. Mary-le-Strand Charity estate, and is intended to supply a great need of the neighbourhood. It contains a library, club-room, mission hall, and reading-room, and in the basement are lavatory accommodation and baths for both sexes. The caretaker has a suite of rooms on the top floor. The material used is red brick, with dressings of Doulting stone. The staircases are entirely of York and silex stone. The building has been fitted throughout with electric light, and is heated with hot water. All floors are fireproof, Messrs. Homan and Rodgers' system being used. The stained-glass fanlights contain medallion portraits of celebrated writers of the Victorian era. The architect is Mr. Albert Vicars, of Somerset Chambers, 151, Strand, and the general contractors were Messrs. J. M. Macey and Sons, of Wych-street, Strand. Mr. Ernest Avern acted as clerk of works.

THREE COURTYARD STAIRCASES.

These are capital examples of the picturesque treatment to which exterior staircases lend themselves. The central one is from a house in the Rue du Petit-Salut, Rouen, and is an ingenious and massive piece of construction, showing a clever arrangement of circular steps leading up to a Renaissance doorway, and at the same time, at a higher level, forming the starting-point of the stairs proper to the upper floors. The circular flight to the left-hand of the page, capped with a conical roof like a turret, is from a sketch by Mr. C. Malo, recently given by the *Moniteur des Architectes.* It is as unlike the former as it is dissimilar to the third drawing, which shows a more formal open staircase to a 16th-century house. This last one, too, exhibits a stone treatment with elaborately-carved close balustrade in place of the open wooden balustrading of the other two.

* * *

At the meeting of the Gainsborough Local Board on Monday, there were 133 applicants for the vacant office of surveyor to the board, Mr. MacDonald having accepted an appointment at Rugby, the salary being £175 per annum, and four candidates, Messrs. Kidd of Ripon, Currey of Selby, Saunders of Oldham, and Riley of Halifax met the board. Mr. Riley was finally selected and appointed.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Edinburgh Architectural Association.—The session of this association was inaugurated on Thursday in last week by a *conversazione* held in the Royal Institution. There was a large attendance of ladies and gentlemen, who were received by Mr. W. W. Robertson, the President of the association. After tea, the President delivered an inaugural address. He said his attention had been drawn to the recent addition to the Advocates' Library of the manuscript journal of James Playfair, extending over the period from 1783 to 1793. He had read the journal, and found it to be a plain business record of journeys taken, work done, and accounts rendered. A good deal was disclosed that was interesting—glimpses of the habits, the life, and the work of the time, but not very much of the man. He explained that James Playfair was the father of their William Henry Playfair, the distinguished architect of Donaldson's Hospital, of the building in which they were then assembled, and of many others which ornamented the city. He was a Scotsman who had migrated to London, and established himself as an architect in Russell-square. Mr. Robertson then quoted freely from the journal, beginning with business entries. At the close of his address Mr. Robertson was, on the motion of Mr. Balfour Paul, accorded a vote of thanks.

Glasgow Architectural Association.—The third lecture of the winter series was delivered on Tuesday evening in the Rooms, 114, West Campbell-street, by Mr. James Chalmers, I.A., the subject being "Egyptian Art." Mr. W. Tait Conner, A.R.I.B.A., occupied the chair. After introductory remarks dealing with the historical and geographical side of the subject, the lecturer spoke at some length of the nature of the materials employed by the ancient Egyptians, and explained the various theories held by authorities as to the methods of quarrying and transport of the huge blocks of stone. Views were shown by limelight of many notable ancient buildings.

* * *

CHIPS.

St. Hedda's Roman Catholic Church, Egton Bridge, near Whitby, was reopened on Wednesday week, after having been renovated and redecorated by Mr. White, of Whitby. New statues of the Cross, executed in terracotta by M. Zens, a Belgian artist, were dedicated at the same time.

At Dunsby, near Bourne, the Governors of the Charterhouse are carrying out a waterworks scheme. The supply will be obtained from an artesian well which was made for Mr. Justice Lawrance, at Dunsby Hall, and from this source the water will be raised to a reservoir in a field adjoining the Bourne-road. From the reservoir it will be carried to the village, about half a mile distant, through 2in. mains. The contract is in the hands of Messrs. Wadsley and Son, of Horbling.

The lighting committee of the Bournemouth Corporation have recommended the town council to accept the offer of the Bournemouth and District Electric Light Company to supply current to the Winter Gardens at a reduction in cost of 25 per cent. This is in consequence of a report of the borough surveyor, confirmed by Mr. E. Matthew Lacey, consulting engineer, proposing a scheme for the corporation to generate their own supply of current, whereby a saving of £150 per annum was shown. Mr. E. Matthew Lacey also reported on the proposed scheme for lighting the pier and pleasure-grounds.

At St. Marychurch Town Hall, near Torquay, on Friday, an inquiry into the application of the local board for sanction to borrow £2,000 for the purpose of pleasure grounds was held by Colonel John O. Hasted, R.E., Inspector of the Local Government Board. There was some opposition, a ratepayer saying the proposed site was only a "swamp."

The personalty of Mrs. Mary Ann Atkinson, 47, Gordon-square, has been sworn at upwards of £72,000. The testatrix bequeaths £1,000 to the Female School of Art, Queen-square, to found a scholarship in perpetuity, to be named the "William Atkinson Scholarship" for the benefit of those studying at the said School of Art for the purpose of obtaining a livelihood, and £500 to the Artists' General Benevolent Institution.

The partnership heretofore subsisting between C. Kirk and H. Kirk, architects, of Sleaford, under the style of Kirk and Son, has been dissolved; as has also that heretofore subsisting between R. Evans, sen., W. Jolley, and R. Evans, jun., architects and surveyors, Nottingham and Burton-on-Trent, under the style of Evans and Jolley; so far as regards W. Jolley.

WAYSIDE NOTES.

A MEETING of the Portland cement manufacturers of the Thames and Medway districts was convened at Cannon-street Hotel on the 12th inst., to take steps for the formation of an Association to protect their interests. Mr. Bevan, of the firm of Messrs. Knight, Bevan, and Sturge, was called to the chair, and representatives of about thirty of the leading manufacturers were present. A circular signed by a firm of solicitors was read, stating that, "It is becoming notorious that several manufacturers of English Portland cement are largely adulterating their manufacture by the mixture of Kentish rag stone, other stone, furnace or oven ashes, disused or exhausted firebricks or other inert material, and so bringing disrepute upon the good name English cement has hitherto borne in comparison for quality with cement of foreign manufacture. Such practices are so detrimental to the best interests of the cement trade, both by the discredit which is therefore attached to English manufactures, and the unfair competition in prices thereby rendered possible, that it is now proposed to establish an Association of English Cement Manufacturers for the purpose of dealing with, and, if possible, putting a stop to, a practice so unprincipled and disreputable, and so calculated to perpetuate an injury to the trade."

The Chairman suggested that the Association should only include members of the trade who had utterly clean hands, and it was agreed that all joining should sign a statutory declaration expressly stating that the member's firm or company had not during the past three years sold any adulterated cement. The movement did not meet with unanimous approval, for Mr. Holt, of Messrs. Macevoy, Holt, and Co., asserted that Kentish rag stone, far from being an adulteration, was a vast improvement to cement, as it improved the colour and power to resist tensile strain, while the sand tests obtained from cement so treated were higher than from cement made of chalk and clay only. These assertions he supported by tests covering over a year's trial. He contended that the true checkmate to adulteration was the specification, and that customers should alone be the judges of what materials should enter into the composition of cement. Mr. Holt was pressed to give details of his manufacture, but, with much show of reason, declined to give himself away. Mr. Wilders, of Messrs. Wilders and Carey, corroborated Mr. Holt. Mr. Porter and Mr. Leedham White (Messrs. J. Bazley White and Brothers), neither of whom had used Kentish rag in their cement, strongly urged that the London Chamber of Commerce was the proper body to deal with the question, Mr. White suggesting that as there were "certain substances" which, within small limits, might have an important effect in improving the properties of Portland cement, they should follow the strict rule laid down by the German Association, which permitted of the introduction of 2 per cent. of ingredients other than the raw materials of which Portland cement was primarily made. The amendment was declared lost, and it was agreed to form an Association on the lines suggested, the declaration being signed by representatives of Messrs. Knight, Bevan, and Starge, the Wouldham Cement Co., Messrs. F. C. Barrow and Co., and the Tower Portland Cement Co., among others. It is certainly time that we knew for certain "What *is* Portland cement?"

The Parliamentary projects foreshadowed in the advertisements relating to next session promise to be less numerous and important than for many years past. The L.C.C. are promoting Bills for the acquisition of the eight Metropolitan water companies' undertakings; for the rebuilding of Vauxhall Bridge and the construction of a southern approach to the Tower Bridge; and also for an amendment of the London Valuation and Assessment Act of 1889. The London and South-Western Railway Company revive the project for a new railway from Holsworthy to Stratton and Bude, on the coast of North Cornwall, and seek powers for various works of widening near some of their principal stations. The promoters of the Great Northern and City Railway scheme will apply for an extension of time for the completion of the works authorised by the Act of 1892. The Tenterden Railway, although brought forward as an independent scheme, is a proposal to construct a railway from the L.C. and D. station at Maidstone, *viâ* Headcorn and Tenterden, to a junction with the Ashford and Hastings branch of the S.E. system at Appledore. The North-Eastern Railway propose to construct a loop line between their Newcastle and Berwick main line and the Blyth and Tyne branch, from Cramlington and South Blyth. Parliamentary powers will be sought for the formation of a new railway company, under the title of "The Leigh and South Central Lancashire Railway Company." The proposed line, about ten miles long, will diverge from the Lancashire and Yorkshire Railway at Walkden, and, passing through Boothstown and Astley, will continue through Leigh and Abram, and rejoin the Lancashire and Yorkshire Railway near Ince. Leigh would thus get direct communication with Wigan, Southport, and Liverpool on the one hand, and with Manchester on the other.

Mr. Silvanus Trevail, J.P., County Councillor for Cornwall, who was recently elected on the council of the Society of Architects, has been chosen as Mayor of Truro. The *West Briton* remarks:—"As chairman of the Sanitary Committee of the County Council, he has, during the last two or three years, done more than anyone else probably to improve the sanitary condition of Cornwall; and for his work in this respect the county owes him a deep debt of gratitude. It is further indebted to him for the part which he played in 'The Battle of the Railways' last year. By his prompt and resolute action in acquainting Parliament with the real state of public feeling in Cornwall in regard to the question of railway development, he accomplished an unprecedented feat in inducing the House of Commons to reject the Truro and Newquay Junction Bill, after it had been passed by the Select Committee. By his action in the matter he won the thanks of the whole county; and the feeling of gratitude will shortly find tangible expression in the presentation to Mr. Trevail of a testimonial of over £300 value."

For the first time, ladies are coming forward as candidates at the vestry elections in the Metropolis. There are lady candidates alike in Kensington and in Hammersmith. For the latter parish your contributor, Mrs. Halliday Sparling (Miss May Morris), daughter of Mr. William Morris, and another lady are before the electors, and both give good evidence that they will be able to help efficiently in administering the complicated laws with which London vestries have to deal.

It always disturbs the "Christian Member for Northampton" to fancy anyone else is for the moment a greater favourite with the Almighty than himself. And so, accordingly, Mr. Labouchere falls foul in *Truth* this week of an old acquaintance after this fashion:—

> "A Mr. Harry Hems, of the Ecclesiastical Art Works, Exeter, has won a prize in a weekly paper with an article entitled, 'Why I succeeded in Business,' which is about as sickening an effusion as I have read for a long time. This pious individual proclaims that 'all through his life he has had the blessing of the Almighty rest upon his efforts.' One of these efforts was to beg his way from Florence to Boulogne rather than write home for money. 'I made a very good cadger,' he says, and then goes on to boast that he actually saved money on the journey! Hems declares that he has 'educated himself into considering his own business his greatest delight,' but 'money-making has always been a secondary consideration.' Still, he reckons that he has secured two fortunes—'one in houses and land, whilst the other is *banked up aloft!*' If this is not cant, I should like to know what is."

Well, Mr. Labouchere ought to know pretty well by this time! He is a past master of the cant of Radicalism, and aspires doubtless to the monopoly of the article. Better retire to educate "infant phenomenons" into boring afternoon assemblies with Shakespeare, and cease to get his shirt out at the other favourites of Providence.

◆

In the series of art lectures promoted by the Glasgow Corporation, Dr. J. Forbes White lectured on "Velasquez" to a large audience in the Corporation Galleries, Sauchiehall-street, on Saturday evening.

Mr. William Harrison, builder and contractor, Cotham-street, St. Helen's, Lancs, died on Saturday from the effects of a fall sustained on Sept. 23. Mr. Harrison, who was 71 years of age, was at one time foreman for the late Mr. George Harris, a local builder, but had been in business on his own account for over 30 years. Among the buildings erected in the town by the late Mr. Harrison are those of Messrs. Beecham, the Cowley Schools, and the gymnasium of the St. Helen's Young Men's Christian Association.

OBITUARY.

We regret to announce the death of Mr. FREDERICK HEMINGS, A.R.I.B.A., of 20, Budge-row, E.C., at the comparatively early age of 39 years. Mr. Hemings was articled to Messrs. C. G. Searle and Son, of Bloomsbury, and afterwards in the offices of Mr. T. Chatfeild Clarke and the late Mr. G. E. Street, R.A., and then became chief assistant to Col. R. W. Edis, F.S.A. Twelve years since he joined the Institute as an Associate, and soon afterwards commenced independent practice. His work principally lay in commercial buildings and residences in the City and West-end, and included the south wing of the buildings erected on the site of St. Paul's School in the Churchyard, Mr. Delissa Joseph being the architect of the northern portion; a large block of warehouses at Paul's Chain; Cheyne Court, Chelsea, a block of residential flats covering an area of an acre; a still block of like character beyond the Albert Hall, and known as Prince Albert Mansions—this unfinished work remains stationary at the third floor, being one of the schemes involved in the Liberator crash; the Kings and Keys in Fleet-street, illustrated by us on February 13, 1885; shops and offices at the corner of Finsbury-pavement and Chiswell-street; and Clement's Inn Chambers, Strand. He had in progress at his death a series of six blocks in flats in Grey Coat-street, Westminster, for the governors of the Grey Coat Charity. Mr. Hemings, who died from bronchitis accelerated by weakness of the heart, leaves a widow and two children.

MR. JOHN FARRELL, who will be recollected by many readers as having been for many years the energetic and kindly secretary of Claridge's Patent Asphalte Company, Limited, of the Victoria Embankment, died on Saturday last at his residence, Putney Park-avenue, Putney, aged 80 years. Few men probably have had such lengthy careers in connection with a single industry as Mr. Farrell, and certainly none worked harder to secure the well-merited success he achieved. Keen and business-like, and as straight as a needle, Mr. Farrell was wont to hide from superficial acquaintances a good deal more depth of feeling than some gave him credit for beneath a veil of brusque humour. Familiarity, however—not that it was every man with whom Mr. Farrell readily became familiar—soon revealed the kindly disposition and genuine cheerfulness of the man, and made all kindred natures at home with him. Few men will be more missed in their own circles. We are glad to hear that Mr. R. T. Wilkinson, who has been for nearly forty years assistant to Mr. Farrell on the staff of the Company, has been appointed his successor.

◆

CHIPS.

The Earl of Derby opened, on Friday, the new wards and dispensary in connection with the Hospital for Women, Shaw-street, Liverpool. Mr. Powell, of Messrs. Sinnott, Sinnott, and Powell, of Liverpool, is the architect.

Lord Kinnaird visited Croydon on Saturday, and laid one of the memorial stones of the Young Men's Christian Association Jubilee Building, which is being erected in North-end, at a cost of £7,000.

The Blaydon-on-Tyne Local Board have recently applied to the Local Government Board for sanction to borrow £1,275 to carry out works of sewerage and sewage disposal at Spen, and the usual inquiry was held on Friday at the Board office, Blaydon, by Colonel Coke, an inspector.

The City Court of Common Council decided at their last meeting to abolish the vacant office of surveyor to the City Lands and Bridge House Estate. In future the duties will be discharged under the personal responsibility of the City Surveyor by members of his staff, and the appointment of an officer as distinct from the City Surveyor will be discontinued.

A memorial window has been placed in the north aisle of St. Stephen's Church, Willenhall, in memory of the late Mr. John Wakelam. This window was executed by Mr. T. W. Camm, of The Studio, Smethwick. Subject: "Lord, to whom shall we go? Thou hast the words of eternal life."

A new infant school has just been opened at Dunston-on-Tyne; it has been erected from designs by Mr. T. C. Nicholson, F.S.A., Grainger-street, Newcastle.

The architectural section of the Glasgow Philosophical Society met in Glasgow on Monday evening, when Mr. T. L. Watson delivered the presidential address, his subject being "Glimpses of Four Great Periods of Italian Art."

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE second ordinary meeting of the Institute was held on Monday evening, Mr. Alexander Graham, F.S.A., vice-president, in the chair. The deaths were announced of Mr. Charles G. H. Kinnear, of Edinburgh, Fellow; and of Mr. Frederick Hemings, of London, Associate.

NOTES ON THE ARCHITECTURE OF CHINA.

A paper on this subject, illustrated by many drawings and photographs, was contributed by Mr. Frederick M. Gratton, Fellow, and was read, in the author's absence (Mr. Gratton being on the return voyage to China), by Mr. William Kidner, who was able to supplement the paper by his own experiences in the country. A brick from the Great Wall at Kopie Koa, and measuring 20in. by 10in. and 4in. in height, was shown by Mr. Hugh Leonard. Mr. Gratton endeavoured to refute the common allegation that China had no architecture properly so-called, and showed that all Japanese art was derived from Chinese sources. The very novelty and grotesqueness of Chinese architecture constituted its greatest charm, and it was surprisingly adaptable to local circumstances and climate. He traced the effect of the successive religious systems on the architecture of the land, and referred to the great destruction of architectural monuments through wars and earthquakes. In referring to existing examples, he alluded to the cities and their walls, and the famous Great Wall, the very existence of which was denied a few years since by those who had never visited China. At the present time, 1,281 cities were encircled by high crenellated or embrasured walls, generally averaging from 25ft. to 30ft. in height, sometimes flanked with towers. The simpler form was a single wall, with an earth-slope downwards from the top to the general level on the city side; sometimes double, like the Great Wall. They were of stone, of brick with stone or granite bases, or with stone or granite facings; substantial structures of carefully prepared and good material. Three other cities are surrounded by earth mounds or "mud walls." The cities were quadrilateral or circular in plan, the principal gates being placed to face the four cardinal points of the compass. A moat usually encircled the walls, and water-gates were placed near the main entrances, over which were the watch-towers or guard-rooms. Pekin, the present "yellow" capital, covered an area, exclusive of suburbs, of about twenty square miles. It consisted of the Tartar and Chinese cities, each encircled by immense walls slightly exceeding 23 miles in length. That of the former was loop-holed, crenellated, and bastioned at intervals of about 60yd.; it averaged about 50ft. in height and 40ft. in width, with three-storied pagoda-like erections surmounting the principal gateways. In the heart of the Tartar city was the walled enclosure of the "Forbidden City." The walls of the Chinese city were about 30ft. high, 25ft. thick at base, and 15ft. wide at top. Nankin was formerly the capital of the empire. Its thick, embrasured walls consisted of three concentric circles, the outer pierced with eighteen gates, some of which were now blocked up and disused; the second with thirteen gates; and that of the Imperial, or Sacred, city with four gates. Rich as had been this city in architectural monuments in the day of its supremacy, none of its wonders remained except in the ruins of its royal palace, pagodas, temples, and marble-paved causeways. There were, however, several modern buildings of note in its Confucian temples. The city of Hangchow was also formerly the imperial capital, and was of great historical interest. Its walls, which were said to have measured at one time thirty miles, were now only twelve miles in extent, and embraced some interesting relics. Having described other cities, the author then passed on to describe the beamless and bronze temples, the ornaments and images of the latter metal; the palaces, pagodas, towers, and pavilions; the official residences, philanthropic institutions, and pawnshops, closing with an allusion to the bridges, mausolea, and tombs. In conclusion, Mr. Gratton expressed the opinion that, although there might be nothing *grand* in the Chinese architecture as seen to-day, there were remains and proofs of a distinctly national architectural style. The slender and elegant monolithic columns of stone, bronze, and wood, with base, but without capital; the decorative dragons encircling or enriching them; the shape of openings; the form of roofs, ridges, and terminals; the pattern and design of the ornamental woodwork or pierced stone; the shape of mouldings; the grotesque character of all carved work (except foliated); and the curious but beautiful neutral notes of applied colour—all these, he maintained, constituted a "style" as distinct as the most rigid Gothic or Classic rules could be said to form. Any definite deviation from recognised proportions or accepted conventionalities, and the "custom" established by the work of centuries, should be considered, as it would surely be, as grave an error in the one case as in the other.

At the close of the paper a short discussion followed, in which Mr. George Aitchison, A.R.A., Sir Henry Howorth, M.P., Mr. R. Phene Spiers, F.S.A., Mr. H. S. Ashbee, F.S.A., and Mr. William Emerson took part, and a vote of thanks was passed to the author and reader of the paper.

BUILDERS' BENEVOLENT INSTITUTION.

ANNUAL DINNER.

THE forty-seventh annual dinner in aid of the funds of this Institution was held on Thursday, Nov. 15, at Carpenters' Hall, London-wall. Mr. Basil P. Ellis, the president of the Institution, occupied the chair, and was supported by Sir J. Whittaker Ellis, Bart., Mr. John Aird, M.P., Mr. Thomas Blashill, F.R.I.B.A., Mr. N. Smith (the Master of the Carpenters' Company), Mr. A. Lucas, Mr. F. J. Dove, Mr. J. Randall, Sir W. Pearson, Bart., Mr. B. E. Nightingale, Mr. H. H. Bartlett, Mr. Howard Colls, Mr. C. Bussell, Mr. J. W. Duffield, Mr. T. Stirling, Mr. W. Shepherd, and Mr. T. Hall.

The Chairman, in proposing the toast of the evening, "Success to the Builders' Benevolent Institution," said it had now been established for nearly half a century, and there was no doubt that during that long period much good had been done by the charity. At the present time the Institution paid pensions to 48 persons, all of whom, in consequence of old age or infirmity, were unable to earn their own living. The committee made very careful inquiries before placing anyone on the list for election, and went personally into all these matters. To enable the committee to pay the pensions, an income of certainly not less than £2,000 a year was required. The investments yielded about £650 a year, which was a great help, but still it would be seen from these figures that a considerable part of the income was derived from annual subscriptions and donations. It was generally admitted at the present time that the building trade was depressed, and for that reason, he was sorry to say, some portions of the income of the charity had fallen off; but he hoped with the hearty assistance they had received from all quarters, and which he gratefully desired to acknowledge in the name of the committee, they would manage, notwithstanding their difficulties, to maintain the Institution on a thoroughly satisfactory financial basis. The charity was very carefully managed; they did not run into debt, and ask their friends to help them out of the difficulty, but they endeavoured to keep within their income. The trade of a master builder was subject to even greater risks than most trades were. A great item to be considered in making a contract was the question of how much the labour was to cost. It was not generally difficult to state pretty nearly what the material would cost, but the labour was a very open question. He believed those who were his elders would admit that it was more difficult than it was 20 years ago to make an estimate as to what the labour would cost in any particular contract. There was all the more reason, then, why this Institution should be well supported. Builders might be well up to their work; but through circumstances over which they had no control, it happened from time to time that they lost a good deal of money, and, in consequence of ill-health, were not able to get up again. As in other trades, the elder men were gradually going out of business, and younger men coming in, and he hoped they would do all they could to get the younger men to subscribe to this Institution.

Mr. F. J. Dove, who replied, said he had been asked to do so in the regretted absence of Mr. G. Plucknett, one of the staunchest friends of the charity. Builders nowadays were so keenly alive to cutting one another's throats, that it was a wonder they were not all applicants for the benefits of the Institution.

The President also gave the toast of "The Worshipful Company of Carpenters," to whom they were indebted for the use of the hall in which they were met, and for their handsome donations to the funds.

The Master of the Carpenters' Company replied, and said that the Company took a great deal of interest in this Institution. The Company had been deprived of a great many of their old functions, but they were doing their best to promote technical education.

In the course of the evening subscriptions and donations to the amount of £966 were announced, of which £804 appeared in the President's list. The President further announced that the members of his firm present had agreed to increase their subscriptions so as to make the total amount up to £1,000.

BOOKS RECEIVED.

First Principles of Building, by Alex Black, C.E., architect, illustrated (London: Biggs and Co., Salisbury-court), is a practical handbook for technical students, in which an attempt has been made to point out to the student the various steps necessary in building, beginning with the primary essentials, such as building materials and the trades connected therewith, and proceeding to discuss the art of planning, estimating, the choice of a sanitary site, soils, staking out buildings, foundations, masonry, carpentry, and the mechanical principles involved in the consideration of stresses, &c. The volume is chiefly taken up with the description of building materials, stones, bricks, cements, plastering, &c., the methods in use of applying them. These remarks will be found pretty comprehensive and useful, as many practical suggestions are made. Paints, painting, glass, glazing, timber and its conversion, metals, and ironwork are dealt with. The principles of construction in masonry and carpentry are next discussed, and are illustrated by diagrams. Graphic statics in its application to determine the stresses on roofs, &c., is explained in a plain and elementary manner, and the joints in timber construction illustrated. We recommend the volume as an elementary manual for the student.——*The Old Churches of Our Land:* the Why, How, and When, of Them. By Francis Baldwin, Architect. (London: Society for Promoting Christian Knowledge.)—For "those in search of a hobby" this little book is intended by its author to be an introduction to the subject of our national church architecture, and to awaken an interest in those who read it by impelling them to study old churches, and to make the subject a holiday hobby. Mr. Baldwin simply and lucidly sketches his subject from the very beginning. A glance at Egyptian, Greek, and Roman architecture prepares the way for the description of the Early Christian or Basilican church. Crypts, Gothic vaults, and their development from the simple barrel or Roman vault, are assigned separate chapters; thus, the vaulting problem is explained so as to make it an interesting step. The churches from the 5th century to the Norman era, and the features of Anglo-Saxon and Norman architecture are very fully described and illustrated. The introduction of the pointed arch and its consequences to vaulting are simply discussed. The Early English and following styles are treated and explained in a way at once to interest and instruct. The forms of window tracery, vaulting, buttresses, cloisters, chapter-houses, baptisteries, gable-crosses, corbel-tables, wall arcades, mouldings, capitals, arches and other features of each period are discussed and illustrated, and the illustrations of these features have been well selected and drawn. To all those who wish for an introductory manual to our national architecture we can recommend this book.——*A Textbook of Mechanics and Hydrostatics*, by Herbert Hancock, M.A., F.R.A.S. &c. (London: Sampson Low, Marston, and Company Ltd.), is a compendious treatise on these subjects for students, and the author has endeavoured to make the student think for himself. The book appears to be in every way adapted for the purpose of teaching the fundamental principles of mechanics and hydrostatics, and the elementary parts of trigonometry are explained simply and clearly, the geometrical meanings of angles, sines, cosines, tangents, &c., being given; and the chapter on "Motion, Velocity, and Acceleration" gives in simple language, and by the aid of familiar examples, the chief laws. Graphical means of estimation are used, and the numerical examples are well calculated to assist the mental process. Such propositions as the parallelograml triangle, and polygon of forces are thoroughy explained in the chapter on "Force and Forces," and the mass-centre and centre of gravity are geometrically demonstrated by reference to excellent diagrams. The illustrations and letterpress are all that can be desired for clearness, and the textbook contains a capital exposition of fluid pressure and the pressure of gases, and an appendix of examination papers is given at the end.——*A Handbook of Ornament*, by Franz Sales Meyer, second English edition, revised by Hugh Stannus, F.R.I.B.A. (London: B. T. Batsford), is a new and revised edition of Herr Meyer's valuable handbook of ornament which we noticed some time ago. Mr. Stannus, Lecturer on Applied Art, South Kensington, has simply revised the chapters and terminology so as to make the German edition more presentable to English students. As a classified handbook of ornament Meyer's work has few equals, and is an acknowledged treatise in the leading art schools in Germany and America. The illustrations are numerous and well-drawn, and represent every class of applied ornament. Three main divisions are recognised:—(1) the elements of decoration, such as geometrical elements; natural forms, as those of plants, leaves, and flowers, animal and human organisms; artificial objects; (2) ornament applied to features like bands, borders, panels, diapers, &c., (3) decorated objects under which every variety of vase, drinking vessels, candelabra, utensils, jewelry, &c., are described and classified. Thus the arrangement is thoroughly scientific, and ornament is discussed according to its functions, and the student is taught on what principles decoration is applied to objects such as vases, utensils, furniture. These several objects are briefly described, and their main features analysed.——*The Story of Selby Abbey* (London: David Nutt, Strand; Selby: W. H. Spencer) is a narrative in popular form by the author of "Old Time Stories." Several illustrative sketches and photo. blocks are given, freely drawn, and are chosen to give a general idea of this fine old abbey and its details. The author and publisher have both done their best to convey in a small compass the chief incidents of the history of and features of this fine example of monastic church architecture in Yorkshire, from the time of its foundation to the restoration of the church by Mr. Oldrid Scott. Few abbeys retain so much that is pure and beautiful from the Norman to the Perpendicular; the Transitional features from Norman to Early English and Decorated being well preserved as in the triforium of nave. The east end of choir is a most beautiful example of Late Decorated. This little guide-book will be found to be a valuable summary of all that is interesting in the abbey.——*The Villagers' Magna Charta*. By J. Morrison Davidson. Reprinted from the *Weekly Times and Echo*. (London: William Reeves. 6d.)—In this vigorous little book of fifty pages, Mr. Davidson, who describes himself as a "literary watch-dog of Democracy," has told the rural population of England just what the new Local Government Act is, and what are their powers and opportunities under it. Mr. Davidson thinks with reason that average villagers will find much difficulty in dealing "with the dense mass of intractable matter embodied in this most complex and perplexing statute," and therefore he has provided the villager with a popular digest of the Act, interspersed with those pungent and biting phrases and happy quotations which are characteristic of Mr. Davidson's style.

◆

John Park, a plumber, died on Tuesday in the Glasgow Royal Infirmary from injuries sustained on the previous day through falling from a house in George-street. He was being raised to the roof by a pulley, when a dislodged brick knocked him off his seat and into the court below, a distance of 25ft.

At the meeting of the Baths Committee of the Bath town council, on Friday, the letter from the Local Government Board giving sanction for the raising of a loan of £30,000 for the Pump-room extension was read. The Board stated that they retained the views which they had conveyed to the town council respecting the expediency of setting back the proposed building; but they had not considered that the refusal of the town council to act on those views would justify them in withholding their sanction to the loan. The chairman stated that the architect, Mr. J. M. Brydon, of London, would attend a special meeting of the committee to consider a modification of the plan, so that the water of the Roman baths might not be covered over. Sir Jerom Murch also suggested that room in the new building might be used as a permanent art gallery.

Building Intelligence.

Bishopsgate, E.C.—The new buildings of the Bishopsgate Institute will be opened by Lord Rosebery to-morrow (Saturday). They comprise hall, library, reading-room, board-room, offices, and caretaker's house, and have been designed by Mr. C. Harrison Townsend, F.R.I.B.A., of 29, Great George-street, Westminster, and erected by Messrs. John Mowlem and Co., of Grosvenor Wharf, Millbank, Mr. Thomas Lee acting as clerk of the works. The elevation of the principal entrance in Bishopsgate-street has been carried out in light yellow terracotta, the modelled work having been executed by Mr. Aumonier. Above this entrance are the board-room and the clerk's offices. The institute has also side and back entrances in Brushfield-street and Duke-street, the frontages of which have been carried out in red bricks, with dressings of terracotta. For general access a corridor runs the whole length of the buildings, and to insure perfect quiet and convenience to the public, the library and reading-rooms have been placed as far as possible from the traffic of Bishopsgate-street, and are also cut off from the hall by another corridor. The corridors and staircases have been lined with glazed tiles. The floors of the corridors and vestibules are of marble mosaic set in red cement. The floors of the library and hall are laid with oak block flooring, and are of fireproof construction, upon Messrs. Homan and Rodgers' system. The stairs to the library and board-room are of solid teak. The hall, 80ft. long, 48ft. wide, and 42ft. high, will seat about 500 people. In addition to the high clerestory windows, a toplight is provided with a view to the hall being occasionally used for exhibitions of paintings, &c. The lending library, director's room, and reference library on the ground floor are 15ft. 6in. high. The height of the reading-room on the first floor is 15ft. The fittings throughout this portion of the building have been executed by Messrs. Lascelles and Co.; those on the ground floor in English oak, and those on the first floor in walnut. The gas-fittings are by Messrs. Sugg and Co., of Westminster. The foundations are in concrete, carried down to the gravel, and the outer area and basement walls are constructed of solid brickwork faced on exterior with asphalte.

Bride-lane, E.C.—The Lord Mayor inaugurated, on Tuesday, St. Bride's Institute, in Bride-lane, Fleet-street. The building, of which we gave a double-page illustration and plan in our issue of Nov. 17, 1893, has been erected from designs by Mr. R. Cunningham Murray, of Racquet-court, the contractors being Messrs. W. Brass and Son. It has a frontage of 107ft., and an average depth of 75ft., and consists of a basement and four other floors. In the basement are a swimming-bath, 75ft. by 27ft., washing-baths, and laundry. At the east end on this level are the lending library, boys' reading-room, and a gymnasium, 48ft. by 23ft. On the ground floor is the hall, and on the floor above are a reading-room, 50ft. by 27ft., and a lithographic printing school. On the mezzanine floor, in front, the Passmore Edwards modern technical library, printing museum, and William Blades library are arranged, and on the floor above are a letterpress printing school and girls' reading-room. The fronts are of red bricks, with Portland stone and terracotta dressings. The cost has exceeded £20,000. Tuesday's ceremony took place in the Hall. At noon the Chairman and Governors of the St. Bride's Foundation, with their clerk, met the Lord Mayor and Lady Mayoress, Alderman and Sheriff Samuel, Sheriff Hand, and their ladies at the west entrance, Bell's-buildings, Salisbury-square. On arrival at the William Blades and Passmore Edwards Libraries, Mr. Drummond invited Mrs. Wm. Blades and Mrs. J. Passmore Edwards to unveil medallion portraits of their respective husbands. These medallions, executed in terracotta by Messrs. Doulton and Co., are from Mr. George Tinworth's studio, and were illustrated in our issue of the 2nd inst. Mr. William Blades' portrait is presented by Sir Henry Doulton, and that of Mr. J. Passmore Edwards by an anonymous donor. After the portraits had been unveiled, Mr. Alfred E. Blades and Mr. Harry Passmore Edwards briefly replied, the latter gentleman remarking that among the many works with which his father had been associated there was probably none in which he took greater interest than in this library of St. Bride's. The Lord Mayor congratulated the parishioners heartily upon having such a magnificent building

London School Board.—The last report of the late School Board states that during the year ended March 25 last the Board were engaged in purchasing interests in 50 sites. The land was acquired on 13 sites for erecting new schools or enlarging existing schools, and in the case of the remaining 37 for completing sites previously purchased, for enlarging the playgrounds of existing schools, or for carrying out general improvements to schools. The total expenditure on the sites was £350,363, with £35,816 costs. The total number of sites for schools purchased at Lady Day last was 435. In the case of 295 of these sites, where the building accounts have been closed, the cost of the land has been accurately ascertained at £2,321,226; and as the schools erected upon them provide a total accommodation for 341,756 children, the cost of the sites per head is £6 15s. 1d. Fourteen new schools were opened during the year at a total cost (including sites, building, and furniture) of £377,278 17s. 8d., or £28 7s. 1d. per head, the accommodation being for 13,305. Enlargements of 25 schools, affording accommodation for 8,246, were also completed and opened in the 12 months, the tenders for which amounted to £153,907. Tenders were accepted for four new schools, 21 enlargements, four new junior mixed schools, and two pupil teachers' schools. The drainage of all the 430 schools of the Board has been reported upon, and the Board have appointed a sanitary surveyor for the purpose of preparing plans and superintending the drainage and sanitary work required. Much of the work has already been carried out. An event of the year has been the completion of the head offices of the Board on the Victoria Embankment, including a new Board room and a library.

Rotherham.—The school situate in Ferham-street and Devonshire-street, Rotherham, is now complete, and was opened on Nov. 15, the total accommodation being for 800 children. The boys' and girls' school, a two-story building, faces Devonshire-street, the boys being on the ground floor, and contains a large schoolroom, 61ft. 6in. by 20ft., giving accommodation for 120, and two classrooms, each 33ft. by 20ft., and accommodating 65 each. The school is built of rock-faced wallstone, with ashlar dressings, the whole being surrounded by stone boundary walls and ornamental palisading. The centre of the street front of boys' and girls' school is surmounted by a bell-turret. The general treatment is of a bold type of modern Classic. The contractor for the work was Mr. Charles Green, and the architect to the board, Mr. H. L. Tacon, of Rotherham, under whose direct supervision the work has been carried out. The clerk of works to the board is Mr. F. Jenkinson. The total cost of the school has been about £7,200, exclusive of site.

St. George, Bristol.—The new High Grade and Technical Schools, erected by the St. George's School Board, were opened on Friday. The schools have been erected at a total cost of nearly £14,000, from plans by Mr. F. Bligh Bond, of Liverpool Chambers, Corn-street, Bristol. In the basement is provided a metal workshop, 52ft. by 31ft., and this is supplied with a forge. There is also a wood workshop, 58ft. by 21ft. On the ground floor there is a central hall, 52ft. 6in. by 32ft., having a classroom 27ft. by 25ft., connected therewith, the divisional arrangement being a movable glazed screen, which can be run back. On the ground floor there are double classrooms, 59ft. by 22ft., and another 25ft. square. In precisely the same manner the first floor is laid out, the ground floor being for boys and the first floor for girls. The buildings are of brick and terracotta, and the roofs are covered with green slates. The style of architecture is pure Renaissance. Internally the floors are fireproof, having been constructed of concrete and iron. The builder was Mr. C. A. Hayes, of Bristol.

Southampton.—The new post office erected by H.M. Office of Works in the lower part of the High-street will be opened in December. Mr. Henry Tanner, F.R.I.B.A., is the architect, and the contract was let in November, 1892; but owing to delays the building operations were taken over by the Office of Works in February last. The street façade is in the French Renaissance style, and is carried out in Fareham bricks and terracotta. The public office is 34ft. 6in. by 25ft. 6in., and has a height of 15ft. The outer office is dadoed with glazed bricks panelled in design in colours, and the whole office is heated by hot-water pipes and open fireplaces. The flooring of office and the main staircase are of silex stone. The first floor is divided into two rooms—that on the south, 18ft. by 19ft., being appropriated as the office of the postmaster; and the larger room, 27ft. by 18ft., will be occupied by the staff. On the second floor are a store for stationery, 17ft. by 18ft., and two other rooms, and the upper floor is occupied by the caretaker's apartments. At the back of the public office on the ground floor is the sorting-room, which is about 191ft. long with an average width of 44ft., and a height to the apex of the roof to 21ft. It is ventilated by Kershaw's pneumatic extractors. The wood blocks for flooring were supplied by Mr. R. L. Lowe, of Farnworth, near Bolton; the joiner's work in the carcase of the building was executed by Mr. Elliott, of Newbury, and the rest by Messrs. Playfair and Toole, of Southampton. The terracotta, mainly, is from Doulton's of Lambeth; the facing bricks were supplied by Mr. Plummer, of Fareham; and the rest by Mr. Sydney Nichols, of Southampton. Mr. James Atkinson, of H.M. Office of Works, has been clerk of the works throughout.

Usk Priory, Mon.—The interesting old house known as the Priory, Usk, has just been considerably enlarged by the addition of a new wing, comprising a large smoking-room with garden entrance, servants' hall, and staircase on the ground floor, and additional bedrooms and bathroom on the first floor. The new buildings are Domestic Gothic, in the Tudor style, stone built, and the roof covered with stone shingles obtained from old roofs; the dressings are in St. Aldhelm Box Ground stone. The whole of the works, including all the oak woodwork, have been carried out by Messrs. Knox and Wells, contractors, Cardiff, to the designs and under the superintendence of the architects, Messrs. Veall and Sant, of Cardiff.

Engineering Notes.

Institution of Junior Engineers.—The opening meeting of the 14th session of this institution was held on Friday evening at the Westminster Palace Hotel. The retiring president, Mr. John Wolfe Barry, C.B., took the chair. His successor, Mr. Alexander Siemens, M.Inst.C.E., delivered a presidential address, in which he remarked that few works of any importance could be carried out by the civil engineer without circumstances occurring which compelled him to exercise his ingenuity in suitably modifying his methods. Another factor which operated in a similar way was the constant development of new requirements in the course of the progress of civilisation. Every novelty introduced brought in its train a fresh set of requirements, which made a demand on the resources and the versatility of the engineering mind. Those problems constituted, in fact, one of the principal attractions of the engineering professions. Generally, they might say that, in order to approach a problem with the most certain prospect of success, it was necessary (1) to define, as accurately as possible, the want that existed, or the particular object that was to be attained; (2) to be well acquainted with the scientific principles which came into play; (3) to know how the want was met, or the object attained in practical life; (4) to find out what proposals had been made by others in the same or in a similar case. A careful attention to these requirements would prevent much disappointment and waste of energy.

◆

A new Wesleyan chapel was opened at Burton Leonard, in the Ripon circuit, on Friday. It is Gothic in style, and seats 114 persons, and has at one side a schoolroom, and will increase the sitting accommodation, when required, to about 180. The building is of brick, and it is faced with red pressed bricks from Leeds, while the quoins and dressings are of local limestone. The work has been carried out under the superintendence of Mr. T. Stokes, Thirsk. The cost has been about £600.

A porch has just been completed at the east end of St. Margaret's, Westminster. It is of a character corresponding with the western porch erected some few years since, though of much more modest proportions. It is entered by a wide archway in two orders, enriched with carved pateræ, and flanked by buttresses terminating in square gabled and crocketed pinnacles. The sides are plain, the roof is flat and covered with lead and protected by an enriched parapet. The porch is vaulted in stone internally in lierne groining with carved bosses. The interior will be enriched by sculpture.

Correspondence.

STAINED GLASS.

To the Editor of the Building News.

Sir,—I am sorry to trouble you, but I must ask you to put in the next number of the Building News an apology for your having published a libel against me, in that you *published in your last issue* a libel contained in certain remarks made by Mr. H. Bacon in regard to myself. I have no doubt that you will do so immediately, and that we shall have no further trouble.

I have received letters giving a very luminous account of Mr. H. Bacon.—I am, &c.,

W. B. Richmond.

Beavor Lodge, Hammersmith, W., Nov. 21.

[We fail to see wherein *we*, at any rate, have libelled Mr. Richmond. We regret, of course, if any statements made by Mr. Bacon were inaccurate, and we have given full publicity to Mr. Richmond's contradictions, and to all others which have reached us. But the report was a fair one of Mr. Bacon's paper, and Mr. Richmond surely does not mean to insist on apologies from *us* for Mr. Bacon's remarks, and for which Mr. Bacon is responsible?—Ed. "B. N."]

Sir,—The tone of Mr. Richmond's letter is not at all calculated to disarm opposition. The ego looms so large in his constitution, that he even presumes himself to be the cause of my "advertising article." However hurtful to his *amour propre*, I must undeceive him. My invitation to read a paper to the Manchester architects was accepted by me five weeks before he spoke at Exeter. Mr. Richmond is in no sense the cause or even the matter of my paper, but merely an incident *ad rem*.

His taunt as to self-advertisement I pass by as irresistibly droll, coming from him; one naturally thinks of the old-time adage about Satan rebuking sin. He is kind enough to traverse my statements in the singularly courteous manner so exclusively his own; but mere verbal accuracy apart, he undoubtedly substantiates them, as he admits the ornament was drawn by another, and the major portion of the glass-painting was done by unknown assistants; and until the generality of folk know their names and status on the work, it does savour of cant for him to lecture people as to the necessity of contact between the public and the actual worker. The *bald* inscription of a string of names upon the generally invisible cathedral archives won't help us, and I don't gather that his glass painters even achieved that publicity. He thinks Messrs. Powell would have enlightened me, and from what I know of these gentlemen, I agree with him; but Mr. Richmond is probably unaware that Percy Bacon and Brothers won for them several window competitions, the donors, of course, being quite ignorant of their existence, in accordance with the commercial system. That being so, I could hardly ask them information as to the conduct of their business. Understand me, Sir, I lay no complaint to Messrs. Powell, who always knew what they wanted, invariably the best we could do, and which was promptly paid for with many courtesies.

I do not assert of Mr. Richmond that he deliberately suppressed, either actively or passively, the names of his subordinates, but state a simple fact—i.e., "they are unknown"—and about this I feel acutely, and, I think, with good cause. For eight years, Sir, my brothers and myself, together or singly, acted as designers, draughtsmen, or painters for 15 of the largest so-called stained-glass artists in London, besides many provincials, with a result that, instead at the end of that period of reaping the reward for such long service of a good reputation, we were as absolutely unknown to Mr. Richmond and everybody else as if we had never started.

Can he wonder at our jealousy for fellow-workers who are in this chrysalis stage?

He says he spent three weeks in double-glazing a window, and doubts if I would, or any other commercial firm. I have seen most of the old glass in England, France, and Holland, and made tracings of a great deal of it, but have never come across an example of such a thing, and conclude Mr. Richmond must have made a blunder in calculating the effect of his glass, and thus repaired it. Be this as it may, he is pleased to treat us to another sample of his Exeter screed, where he assumed all the virtues, constituted himself the judge of all sacred art, and contemptuously dismissed everybody else, architects, sculptors, and painters. So he now condemns us by the epithet "commercial" firm.

Architects and others are well able to take care of themselves; but, as a decorative artist, I enter my most earnest protest against such un-English methods of controversy. What does Mr. Richmond know of me or my firm to warrant this scandalous inference? I venture to say, absolutely nothing! I doubt if he ever heard of us in his life.

Mr. Richmond places us under the stigma we most dread, and do everything possible to avoid. In our studio works are invariably designed, drawn, coloured, partly painted, and superintended from start to finish by ourselves personally. Assistants, where necessary, are treated as creative craftsmen, and not as "hands." They know the clients, and are known by them; are at liberty to, and sometimes do, execute commissions over their own signatures. To Mr. Alfred Higgins I may say that, while admiring the chivalrous championship of his friend, I cannot agree that my "libel," as he phrases it, was gratuitous or unprovoked. Mr. Richmond at the Church Congress made a wanton and savage attack upon all his brethren—architects were reduced to tradesmen, sculptors were described as tradesmen-carvers, all (or nearly all) stained glass was valueless, panel paintings resembled oleographs, &c. As a glass and panel painter, have I, therefore, no provocation? It is true, no names were singled out; but all were pilloried together. It is probably true he has never seen a single work of ours; but the great Art Censor has uttered his *ipse dixit*, and we, in common with all others, hang dangling on the gibbet Mr. Richmond so kindly erected—a spectacle for gods and men. This position I am not at all anxious to occupy, and do not intend to without a struggle.

It hardly seems fair to score off Mr. Higgins, who writes so amiable and well-meant a letter; but he surely sees, in naming the sculptures of the Parthenon, a complete surrender of the point in controversy. It is most certain many assistants were employed. I want to know their names! I don't, and doubt if Mr. Higgins does.

Finally, Sir, I am able to state with confidence that from the studios of at least three London artists, putting our "advertising" selves quite out of the question, works in glass and oils are continually issuing which are not unworthy of a place alongside the productions of a more artistic age, and I should be very happy to give Mr. Richmond their names, that after studying their works he may qualify his most extravagant and unwarrantable assertion.—I am, &c.,

Herbert Bacon.

11, Newman-street, W.

Sir,—Having just returned from abroad, I have read, successively, Mr. Herbert Bacon's capital paper upon the above subject in last week's paper, and Messrs. W. B. Richmond and Alfred Higgins's letters of protest in the current issue of the Building News. Without wishing in any way to intrude upon a subject (stained glass) I know very little about, it is, perhaps, only fair to remark that at the recent Church Congress, held in this city, most of Mr. W. B. Richmond, A.R.A.'s, listeners seemed to treat his gratuitous attacks upon architects as very funny, and nothing more!

Messrs. Powell and Sons have recently executed some excellent mosaics for me, for St. Augustine's Church, Highbury, N., under the personal supervision of Mr. J. Douglass Mathews, F.R.I.B.A., and when I called at their place of business in Whitefriars, E.C., a few months ago, I was certainly asked how I liked *their* mosaics at St. Paul's Cathedral. Down here Mr. Richmond, certainly by inference, took the credit of that work wholly upon himself.

It must be a quarter of a century ago—perhaps more—that, from the designs of Mr. Ewan Christian, F.R.I.B.A., Messrs. Powell and Sons carried out much exquisite mosaic work for me for a Wiltshire church, so I know, personally, that these artists do, and have long done, mosaic work of the highest class.

I have nothing to say for or against the trade catalogue people, of whom Mr. Richmond made such fun. They are entirely outside my own province, and I have no wish to split a lance with them. But as an architect's man—as one who has for a lifetime been engaged carrying out work direct from architects' designs, and under their personal supervision—I distinctly protest against the scornful and satirical manner in which Mr. Richmond recently pooh-poohed the profession before a crowded room of parsons in this city.

If Messrs. Powell and Sons practically carried out the mosaic work lately executed at St. Paul's Cathedral, then Mr. Richmond was, to say the least, most inconsistent in his remarks, and fully merits the lashing that Mr. Bacon is reported to have given him at Manchester.—I am, &c.,

Exeter, Nov. 17. HARRY HEMS.

SIR,—Mr. Richmond, in describing Messrs. Bacon Bros. as a "commercial firm," has unintentionally done them an injustice: "commercialism" is their *bête noir*. Doubtless Mr. Richmond spends many valuable hours without remuneration for love of his art; but so do other people.

Mr. Bacon, for instance, has recently, with the full consent of his brothers, given five weeks to painting in oils and gesso an elaborate panel picture, which he presented to my church. There was no hope of reward or advertisement, for St. Gabriel's is an unknown church in an unknown suburb, and is the very reverse of a "show" church.

When preaching a mission in Kent this summer, I heard that two beautiful little windows had been given to the Sisters at Malling Abbey by Messrs. Bacon Bros. Again, here there could have been no possible return looked for, nor could it be an advertisement, as the windows are in the private chapel of the Sisters.

Of both these works, given without hope of reward and without any inspired paragraphs in the Church newspapers, I can speak in the highest praise, as one who knows pretty intimately a good deal of sacred Continental art, and the panel I constantly saw Mr. Herbert Bacon working at with his own hands.

I am entirely in sympathy with Mr. Bacon, and so is Mr. Richmond, I think, in desiring the regeneration of the system of production of works of sacred art, and I can testify that at Messrs. Bacon's studios the assistant artists are seen and known by name to their clients;—for instance, I am always glad to shake hands with their assistant draughtsman, Mr. Wilfrid Hill, who was introduced by his employers. The very atmosphere of the place savours of artistic comradeship, and cannot possibly with the very slightest particle of truth be described as "commercialism."—I am, &c.,

T. C. ELSDON.

St. Gabriel's House, Bounds Green.

FIREPROOF PLASTER.

SIR,—We concur, in the main, with Mr. Thomas Potter's letter in your last issue, regarding the recent trials made in York-road for the purpose of testing the resistance of plaster ceilings to fire. It is somewhat surprising, however, that the power of plaster, under certain conditions, to arrest the progress of fire should be hailed by so many persons as a new discovery, inasmuch as it has been a perfectly well-known fact for many years.

The system of plastering most suitable for this purpose is admittedly in the form of "slabs," which contain no combustible ingredient, and are toughened by an inner layer of galvanised wire netting. These "slabs" are of great strength and durability, and possess the additional advantage of being applied dry. Further than this, they must surely be considered less expensive than "metallic lathing" treated with wet plaster.

Mr. Potter is undoubtedly right in saying that a plaster ceiling makes the best "first line of defence," that "the second is to thoroughly encase and protect the metal joists, more especially the bottom flanges, upon which the stability of the floor largely depends, and the third is to avoid as much metal, otherwise, as practicable, and allow it room for expansion."

In corroboration of Mr. Potter's view, we refer to a series of fire-tests made during the winter of 1887-8 by Mr. W. H. Stanger, C.E., F.C.S., at Messrs. Middleton's, in Southwark. These tests were attended by several well-known architects, and were fully reported at the time by your contemporary, the *Builder*, in their issue of 25th February, 1888. We may here state briefly, however, that the object was to test the action of fire (over 2,000°) on a pair of iron girders embedded in concrete, as against a pair coated with our patent combination casing—*i.e.*, fireproof wired plaster padded inside with our *non-conducting, fireproof* silicate cotton. The result, as expected, was absolutely in favour of the latter system, the soft padding of silicate cotton allowing the girders to expand and contract without cracking the casing. The girders embedded in concrete gave way in 1 hour and 45 minutes, whereas those incased as described showed no perceptible deflection, nor was the casing at all affected, at the expiration of 7 hours, when darkness set in and the furnace cooled down. Wooden joists treated in a precisely similar manner were found to be equally impervious to fire.

We are in entire agreement with Mr. Potter that practical tests are of immense value, and we have a suspicion that a good many of the so-called fireproofing systems now advertised, if subjected to such severe tests as we have described, would rapidly pass into oblivion.—We are, &c., FREDK. JONES AND CO.

WATER CARRIAGE v. CLOSET SEWAGE DISPOSAL.

SIR,—Mr. Donkin's somewhat invidious way of dealing with the above subject in the BUILDING NEWS of the 9th inst. perhaps requires some reply to his advocacy of a return to first principles—dry-earth closets—as the remedy required to modify the sanitary evils of which he complains, possibly through oblivion of the cause, or causes, to which they are due. If the earth closet provides a remedy, it will be easy for Mr. Donkin to point to the benefits derived by populations from its use, say, in Birmingham or other large towns. The questions to be answered are: first, is zymotic influence less prevalent; secondly, is there a reduced death-rate; and thirdly, is sewage cost reduced? These, Sir, are the real questions of public interest involved in sewage procedure, rather than methods of treatment for liquid sewage or disposal of its sludge products, which are probably those present to Mr. Donkin's mind.

With regard to our present procedure and the undoubted evils to which it gives rise, there are probably few who have studied the question in its "practical details," keeping in view the principles and living laws which govern the subject in nature, but are aware of the chief originating cause, and possibly of the remedy which public interests demand. The difficulties in the way of a radical reform are admittedly great, but possibly not insurmountable. Permit, Mr. Editor, the suggestion, that as Parliament will probably be asked to amend the law relating to river pollution "early next session," probably with a view to greater stringency in regard to trade liquids, the time is opportune for England to follow the example of America, France, Germany, and other nations, to appoint a State Commission of Inquiry into the question, and best method of treating the problems involved in sewage procedure, and its relation to organic pollution of the air, the water, and the soil.—I am, &c.,

Sheffield, Nov. 19. HILL-HARTLAND.

* * *

The Brading Harbour Company will apply for powers next session to carry out a scheme for improving the harbour and for giving additional facilities for shipping. It is also proposed to deepen the entrance channel and to enlarge the area of the harbour. The expenditure is estimated at £20,000. The engineers are Mr. P. W. Meik and Mr. A. C. Schonberg.

The marble bust of Cardinal Vaughan by Mr. W. Charles May, of London, has now been delivered to the memorial committee, and, pending the formal presentation to the corporation of Manchester, it has been placed in the sculpture gallery at the Town-hall of that city. The pedestal, which is of Derbyshire alabaster, bears the inscription, "Cardinal Vaughan, 20 years Bishop of Salford."

Memorial stones of a Primitive Methodist chapel were laid in Ford-street, Coventry, on Wednesday week. The building is Early English in style, and will consist of a nave, 51ft. by 31ft. 6in.; shallow transepts (to be hereafter extended), and a chancel, 12ft. by 9ft.; and organ chambers. Sittings are provided for 340 persons, and underneath are an assembly room and five classrooms, affording accommodation for 300 scholars. Mr. John Wills, of Derby, is the architect, and Mr. W. J. Norwood, of Coventry, is the builder. The cost will be £2,000, exclusive of site.

During the last quarter the amount of sewage dealt with at the Purification Works at Dalmarnock, Glasgow, was 92,795,000 gallons in excess of the previous three months. The cost of chemicals was 26s. 1d., against 22s. 4d. per million gallons last quarter. The total expenditure per million for this quarter was £3 11s. 3 2-10d., against £3, 14s. 2 5-10d. last quarter, or 2s. 11 3-10d. less, and it is expected that the next quarter will show a still further reduction of cost.

Intercommunication.

QUESTIONS.

[11251.]—**Salisbury Cathedral.**—Can any member of the architectural profession or R.I.B.A. inform me whether there have been any measured drawings made at any time of the top stage of the tower, and if so, where they may be seen?—KIRKCALDY.

REPLIES.

[11239.]—**Open-Timbered Roofs.**—"Improver" would hardly expect an essay on the construction of roofs in answer to his question. I repeat that with a well-designed truss the chase is unnecessary, and the statement about weight upon the corbel is part of the design. The point is, What is the construction of the particular roof in question? Other roof-trusses cannot have wall-chases; why should that described by "Improver"?—H. L.

[11246.]—**Lettering Marble or Stone Surfaces.**—There is nothing better than dove-tailed grooving filled in with lead planed off flush.—H. L.

[11247.]—**Architect's Duty.**—The architect should have gone through the heads of specification with his client; but surely few clients would object to a small expenditure on such a necessary matter as ventilation.—H. L.

[11248.]—**Formulæ for Long Columns.**—Both the equations referred to by "Mystified," in the last issue of the BUILDING NEWS, are only particular examples of Gordon's general formula, which may be stated briefly as follows:—Let W represent the safe load that may be placed on a column, or, in fact, any long strut subjected to a compressive stress, A the net sectional area of the column, l the length, and d the least dimension of the cross-sections, the value of which will altogether depend upon the particular form of the cross-section, and for which no general rule can be given. Putting C for the safe compressive stress per square inch of the material, we have—

$$W = \frac{A \times C \times d^2}{a\,l^2 + a^2}.$$

In this general equation, a is a constant derived from experiment, and is equal to 1/400 for circular solid cross-sections, and to 1/800 for circular hollow sections, which I think will explain the difference in the two equations which seem to have puzzled "Mystified." I may also state that engineers and architects differ in the value to be given to C, which will account for the apparent discrepancy in the numerators of the two fractions.—P. S. STRETONNE.

[11249.]—**Window Tracery.**—A treatise on "The Rise and Progress of Decorated Window Tracery in England," &c., by Edmund Sharpe, M.A., London. John Van Voorst, Paternoster-row, 1849. This book may not be the best for the purpose required; but it is very interesting and instructive, and ought to be studied by anyone desirous of producing a tolerable window. The type and finish are exquisite, so the number of copies cannot have been excessive. Perhaps a sight of the book may be hard to come by; but there must be one at the British Museum.—H. W.

[11250.]—**Abutting Buildings.**—The owner of a new erection has no legal right to insert flushings; the matter is usually the subject of mutual arrangement. Does "Doubtful" prefer to have his building injured by the damp?—H. L.

CHIPS.

The town council of Southampton are seeking Parliamentary powers to construct bridges in Chapel-road and Bevois-street, in place of the existing level-crossings over the South-Western main line near Southampton West Station. The scheme has been prepared by Mr. W. B. G. Bennett, the borough surveyor.

A new Gospel mission chapel is in course of erection at Watersfoot, near Rossendale. The chief room on the first floor is 40ft. by 27ft. and 18ft. in height. Mr. Ormerod Ashworth, of Crawshawbooth, is the chief contractor.

A memorial statue of the first Marquis of Argyll is about to be placed in St. Giles's Cathedral, Edinburgh, as a commission from the Marquis of Lorne. Mr. Charles McBride, of Edinburgh, is the sculptor.

The French Ministry have asked for a *crédit* of £2,000 for the repairs of the Roman theatre at Orange. An equal sum is likewise required in order to begin works of reconstruction at the Cour des Comptes, on the Quai d'Orsay.

Progress is being made with the scheme for a new railway through the Yorkshire Dales, and application will be made for powers to construct a line from Skipton to Hellifield, where it will form a junction with the Midland, and thence through Middleham, Coverham, Leyburn, and Richmond, to Darlington. Mr. E. O. Ferguson, of Chesterfield and London, is the engineer; and Mr. Perkins, engineer, of Bishop Auckland, and staff, have been engaged for some time past in the survey of the proposed route.

A movement has been started for the complete restoration of Morland Church, near Penrith, at a cost of nearly £1,500, exclusive of porch and chancel. The edifice is one of the oldest in the North of England. The Ecclesiastical Commissioners will restore the chancel, and the porch will be repaired at the cost of Mrs. Markham, Morland House.

Legal.

ARCHITECTS' RESPONSIBILITIES.

In a case reported in our issue of last week (16th November, 1894, page 701) from Walsall, an attempt was made to extend the responsibilities of architects somewhat seriously. There an architect had been summoned for erecting five new houses and a shop without putting in the necessary damp-course. The defendant, as architect for the buildings, had given notice to the local authorities of the work that was going to be executed. This notice contained a printed note appended in these words: "Further, I will make myself responsible for the work being carried out in accordance with the by-laws." It was argued by the town clerk in support of the summons that the defendant, by signing this notice, and especially with the note appended as quoted, became liable for any breach of the by-laws as if he were the "person erecting the building" within the meaning of the Act. On the other hand, it was urged that the defendant merely signed as architect, and he could not be held responsible under a general statute. The words used in such an Act, which was of a quasi-criminal character, as it imposed fines and penalties, must be strictly construed, and therefore they could only apply to the person actually erecting the building. They could thus only include the builder or contractor, and neither the owner nor his architect could be held liable, whoever signed the formal notices sent to the local authorities at the beginning of the works.

It appeared that, as a matter of fact, the defendant, an architect, had called the attention of the borough surveyor to the omission of the damp-courses, stating that he had told the contractors about it, and that no doubt they would attend to it before the buildings were completed. After hearing arguments, the magistrates dismissed the summons, but they consented to grant a case for the consideration of the High Court, as the point was one of much importance. It seems hardly likely that the Court will hold that the signing of a notice by the architect makes him the "person erecting the building," and so liable for the statutory pains and penalties resulting from a breach of the by-laws. But if this decision should be given it will not be difficult to take care that the actual builder signs such notices himself. **Fred. Wetherfield**, Solicitor.

1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

R. S. B.—Brickfields.—Nuisance.—I am obliged by your letter, but cannot go into the technical details in this column. The magistrate's decision is binding while it stands.

R. W. P.—Agreement.—Holding Over.—Tenancy.—The tenant having held over and paid rent after the expiration of his agreement, has become a yearly tenant, subject to the terms and conditions of that agreement, as far as they are not inconsistent with a yearly tenancy. In this case, I think he can, therefore, be made to insure and to do reasonable repairs, as agreed.

Doubtful. — Payment. — "In Settlement." — On Account.—The creditor cannot be compelled to return a cheque which is for a smaller sum and is marked in "full settlement," and he may keep it if he chooses on account, and send a receipt accordingly. The mere fact of his so doing would not prevent his suing for and recovering the balance, if it were really owing.

Nadum. — Building. — Nuisance. — Damage.—If the nuisance by vibration and otherwise is really serious, it would seem to be a good ground of action for an injunction or damages. But the whole question is really one of fact, and it would be for the Court to decide after hearing all the evidence on both sides. Clearly a case for a local solicitor, who could see the premises, &c.

◆

A meeting of the supporters of voluntary schools was held at Eastbourne on Tuesday to commemorate the completion of three new elementary schools. The buildings have cost £11,000, and accommodate 1,725 children.

A new pulpit, the gift of Lady Sykes, has just been added to the Catholic Church, Spanish-place. It is designed by Mr. E. Goldie, of Kensington-square, and executed in alabaster, with detached Purbeck marble shafts below the floor line. The figures of SS. Paul and John, seated under canopies, divide the body of the pulpit into three equal parts. The interior is lined with cedar, and the same material forms a covering to the top of the cornice. With the exception of the metal handrail and gates, which are by Hart, Son, and Peard, the whole of the work has been carried out by Earp and Hobbs, sculptors, of Lambeth and Manchester.

LEGAL INTELLIGENCE.

In re W. H. Waterman.—The Official Receiver states, in the case of William Henry Waterman, of King's Arms-yard, Moorgate-street, that the debtor commenced business as an architect on his own account in 1888 with no capital. On January 1, 1890, he entered into partnership with two others, under the style of "Holmes, Ballantine, and Waterman," no capital being found by either partner. About September, 1890, this firm was dissolved, and the debtor with only one of his late partners continued to practise as Ballantine and Waterman. This second partnership was also dissolved in April, 1892. The debtor states that since April, 1993, he has carried on business on his own account only. He attributed his insolvency to liabilities incurred by him as a partner in the firm of Ballantine and Waterman, which, he alleges, he has paid. The Official Receiver says the debtor admits that he has been aware of his insolvency ever since 1888, but he alleges that his largest creditor, a relative, to whom he states he now owes £1,484, would never have pressed for payment of his debt. The accounts show gross liabilities £3,760, of which £3,333 are unsecured, with assets of £545. The Official Receiver states that of the unsecured indebtedness, sums amounting to £2,407 are in respect of money lent to the bankrupt.

Serious Charge against a Director.—At the Mansion House, on Monday, Mr. William Templeton Hawkins, a J.P. for Kent, and member of the City Corporation, of 18, Bloomsbury-square, was charged on a warrant, before Alderman Sir Walter Wilkin, that being a director of the National Dwellings Company, Limited, he unlawfully and fraudulently applied to his own use a cheque for £1,200 with intent to defraud. Sir George Lewis said he was instructed to prosecute the prisoner for embezzling and stealing various sums of money, he being at the time the managing director of the National Dwellings Company, Limited. The company was formed in 1875. The prisoner had the entire management of this and other companies. The Alderman remanded the prisoner for a week, and fixed the bail at two sureties in £3,000 each.

Charge against a Builder.—Mr. W. J. Winsford, builder, 4, Charlotte-street, Blackfriars-road, a member of the St. Saviour's District Board of Works, appeared to an adjourned summons, on Wednesday, charging him with laying down a drain at 75, Blackfriars-road, in such a manner as to be a nuisance and dangerous to public health. The defendant said he had supervised the work of laying the pipes, and they were imbedded in concrete. He suggested that the leakage complained of might have been caused by the construction of a lavatory immediately over the new drain. After some further evidence in support of the defendant's contention, Mr. Fenwick said he would give his decision on Monday.

Surveyors' Fees.—Theobald v. Gregar.—At the Lord Mayor's Court, on Monday, this case was heard by Mr. Roxburgh, assistant judge, and a jury. The plaintiff, Mr. Henry Theobald, a quantity surveyor, of 87, Finsbury-pavement, sued the defendants, Messrs. W. Gregar and Son, builders, of Stratford, to recover the balance of an account for professional fees. In the early part of last year the defendants were engaged in erecting a factory and offices for Messrs. Johnson and Butcher at Stratford. The plaintiff was employed to take out the quantities for a number of "extras" at a commission of 2½ per cent. on the total amount of additions, and the like for omissions plus the usual out-of-pocket expenses. His total account amounted to £44 12s. 6d.; he had been paid £32 4s., and now he sued for the balance. In his evidence plaintiff stated that Mr. Jennings, one of the architects, had, after certifying his account, stopped payment of it because plaintiff would not give him a third of his commission. The defence was that Mr. Jennings, the surveyor employed by the ground landlord, was the person responsible, he having stopped payment of the account. The jury found for the plaintiff for the amount claimed.

◆

Professor Joseph Durm, of Carlsruhe University, the author of a treatise on Classical Architecture, and himself an architect of distinction, was summoned to Athens on Wednesday, by the Greek Government, to advise on the measures requisite for the preservation of the Parthenon.

An inquiry was held on Tuesday at the Local Board Offices, Thornhill, by Mr. R. D. Sweeting, M.B., an inspector from the Local Government Board, relative to an application for sanction to borrow £4,000 for the erection of an infectious diseases hospital on the site of the old workhouse at Thornhill Edge. The clerk to the board stated that in the proposed hospital there would be accommodation provided for 12 beds; these would be in two blocks, together with an ambulance shed, mortuary, and other conveniences. As usual, the proposal was warmly opposed by landowners and occupiers whose property would be depreciated by the erection of the hospital.

Our Office Table.

The pictures of the Dutch and Flemish schools at the National Gallery have been rearranged during the past month, under the superintendence of Mr. C. L. Eastlake, the Keeper of the Gallery, and with manifest advantage in classification. Room IV., until lately filled with works by Early Tuscan painters, has been cleared of its former contents, some of which have been placed in the north vestibule at the top of the central staircase, while others have been hung in Rooms II. and III., with the other works of the same school. To Room IV. have been transferred the examples of Early Flemish and German art, hitherto lodged in Room XI., and now supplemented by the Longford Castle Holbein, which had since its acquisition been inappropriately exhibited in the Umbrian Room. All the Dutch pictures now in the Octagonal Hall, together with some others in Room X., will be rehung in Room XI., which has thus been set free. The necessity for the early enlargement of the Gallery, by building over the site of St. George's Barracks, becomes more urgent every year, and ought not, in the interests of the institution, to be much longer delayed.

"Malta and its Antiquities" was the subject of a lecture delivered at the Imperial Institute on Monday night by the Rev. W. K. R. Bedford. The lecturer, who has travelled in the island on ten occasions, said that Malta was rich in historical remains, especially in its Phœnician temples, and there were a few traces of Roman art still to be found in the island, although the spoiler had for some time been at work. Malta was remarkable for its subterranean chapels, one of which was known as the Chapel of Bones, which was situated within one of the fortifications and was very extensively decorated with human bones. Italy, France, and Spain had left their sign-manual on the streets and public buildings of Valetta. The main feature of Valetta, however, was that it was the place of residence of the knights of the Order of St. John, whose church of St. John was one of the most beautiful of its kind now to be seen.

From a letter in *Indian Engineering*, it would appear that engineers are coming round to the conclusion that red-lead and linseed oil make the best paint for iron. Sir William Arrol has been quoted as to the condition of Old Hammersmith Bridge. The iron in that structure after more than 60 years was found to be as good as new and uncorroded, and he attributes its preservation to the use of pure lead paint. The writer in our contemporary observes: "The oil forms a definite chemical compound with the oxide of lead, which adheres closely to a metallic surface, and has great elasticity. Other pigments are merely held on the resin formed by oxidation of the oil, without the formation of a compound proper. Experience is the only means we possess of judging of the preservative quality of any paint. Most of the suggested new preservatives cannot give this proof."

Mason's non-slipping coal plates have before been deservedly commended in these pages for their non-slipping qualities, and the self-locking gear which has now been applied is simple and most effective, as if the plate is dropped into the frame in any position it is at once effectively locked, and cannot be unfastened, only from the inside, but there it can be easily done, either with a stick or a broom-handle. These coal plates are a sure protection against any claims whatever through coal plate becoming worn and slippery, as they remain non-slipping until quite worn out. They cannot tip up, as they automatically fasten as soon as they are put into the frame. They can be opened from the inside only, and it is impossible for them to be left unfastened by neglect.

◆

Mr. E. F. Augustus Spratt, architect and surveyor, Kingston-on-Thames, has received instructions to thoroughly restore Beaumont Manor, near Broxbourne, Herts.

At a meeting of the Aird District Committee of Inverness County Council on Tuesday, Mr. Manners, C.E., reported that the fine old stone bridge across the river Beauly, which was almost entirely destroyed by the great floods a few years ago, had now been restored. It had been inspected by Sir John Fowler, C.E., who expressed his approval of the manner in which the contractor had carried out the work. The cost of reconstruction was £5,728.

WATER SUPPLY AND SANITARY MATTERS.

Douglas, Isle of Man.—At a meeting of the Douglas Town Commissioners, on Friday, the report of the committee recommending an improvement of the present sewerage system of the town, which is on the gravitation principle, by the provision of new brick main sewers, an extra storm outlet, and extra ventilating shafts at a cost of £15,000, was brought up, and its adoption was moved. The chairman of the board, Mr. E. Chadwick, moved as an amendment the adoption of a new high-level system with Shone's ejectors, based upon the report of Mr. Pritchard, C.E. He urged that this system would be more effectual than the gravitation system, and pointed out that though the cost would be £11,000 more than that of the committee's scheme, an extra rate of only one penny in the pound would be involved. The amendment was negatived by a large majority, as was another amendment providing for the high-level system without ejectors, and the motion for the adoption of the committee's report was agreed to.

◆

There is to be a new harbour at Rotterdam on the other side of the Maas, near the village of Katendrecht. The cost is estimated at £22,500.

On Saturday Lord Balvaird declared open a new bridge across the river Almond at Millhaugh. The bridge, which has been erected under the direction of the Central and Perth District Committees of the County Council at a cost of £1,243, is a steel girder structure, built by Sir William Arrol and Co., and will supersede the old Millhaugh bridge, which dates from 1778.

Museum Sunday will be celebrated on December 2, when more than fifty clergymen in London, Edinburgh, Manchester, Birmingham, Bradford, Bristol, and other towns will preach in support of Sunday opening. During the afternoon six special exhibitions will be opened to the members in London, and the Sunday Society has induced the trustees of the Sir John Soane Museum to open that institution for the first time on a Sunday on Museum Sunday this year. The list of towns in which institutions will be open free on Museum Sunday already reaches forty.

MEETINGS FOR THE ENSUING WEEK.

Monday.—Surveyors' Institution. "Incidence of Taxation on Land," by A. Dudley Clarke. 8 p.m.

Tuesday.—Society of Architects. Special meeting to confirm resolution *re* Examinations for Membership. 8 p.m. Paper by Ellis Marsland, hon. sec., on "The London Building Act, 1894." 8.30 p.m.

Institute of Civil Engineers. Discussion on "The Machinery of War Ships." 8 p.m.

Wednesday.—Society of Arts. "Experiments in Aëronautics," by Hiram Maxim. 8 p.m.

Friday.—Glasgow Architectural Association. Annual Conversazione.

CHIPS.

The new hall erected in connection with the Redland High School for Girls was opened on Wednesday evening. The building has been erected by Mr. Veals, from designs furnished by Mr. J. Craik, architect, of Bristol.

The council of the Royal Academy has appointed Mr. G. Birch to succeed the late Mr. Papworth as curator of the Soane Museum. The appointment carries with it an official residence in Lincoln's Inn-fields.

The Cambrian Archæological Association will hold its 49th annual meeting in Cornwall in August of next year. The 50th anniversary of the association will be celebrated in 1896 at Aberystwyth, where its first meeting was also held.

Mr. Jaspar Isherwood Helm, clerk, surveyor, and collector to the Rishton Local Board, was dismissed instantly on Wednesday evening for appropriating money belonging to the board. The audit disclosed the fact that there was a deficit of £4,104, and Helm made a declaration admitting it. He has repaid a sum of £1,065. He had been clerk to the Rishton Local Board for many years.

A curious instance of the passing off of a new picture for an old is mentioned by Mrs. Ady in this year's "Art Annual." Mr. G. F. Bodley, A.R.A., some thirty years ago had given Sir Edward Burne-Jones a commision for an altarpiece for St. Paul's Church, Brighton. The original picture did not suit the position, and was sold to a private collector. Thence it passed through several hands, and was eventually offered to Mr. Bodley himself by a gentleman who had picked it up at a sale for a few pounds. It was, said the seller, the work of an "old master."

Extensive alterations and additions are being made to the Staffordshire General Infirmary. A new south wing and children's ward is being added, and the administrative block is being remodelled from the designs and under the superintendence of Mr. Aston Webb. The whole of the fireproof floors and constructional steel work is being executed by Messrs. Mark Fawcett and Co., of Westminster.

A formal visitation was made last (Thursday) evening to the Trade Training Schools, Great Titchfield-street, W., by Sir Henry Roscoe, M.P., and others. The buildings were formerly the habitat of the West London School of Art, but they have lately been acquired by the Worshipful Company of Carpenters.

For the purpose of conveying natural gas from Greentown to Chicago, a distance of 115 miles, two mains, 8in. in diameter, have been laid down. The gas comes from the wells at a pressure of 315lb. per square inch, and this is increased to 600lb. per square inch by pumps, at which pressure it enters the mains. The pipes are of wrought iron, and have proved to be very tight. The loss of pressure in three days, when closed at each end, after having been previously pumped up to 600lb. per square inch, is said to have been under 1 per cent. The capacity of each main is about 700,000c.ft. per hour, delivered at Chicago.

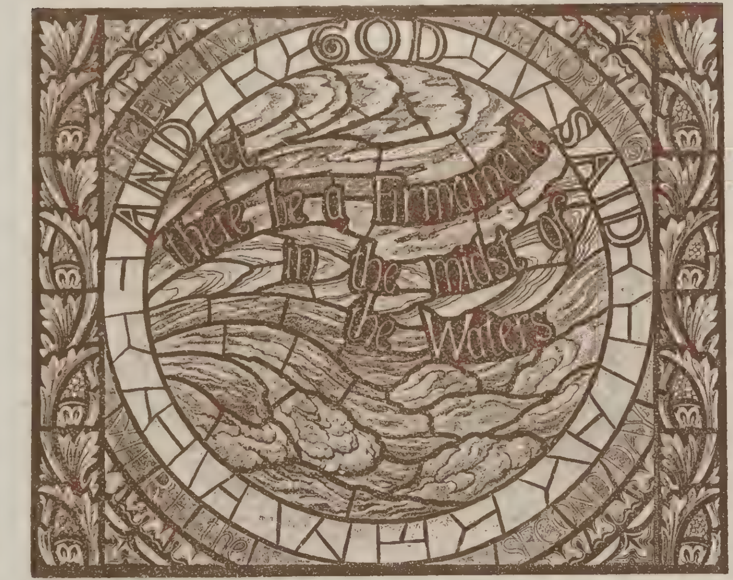
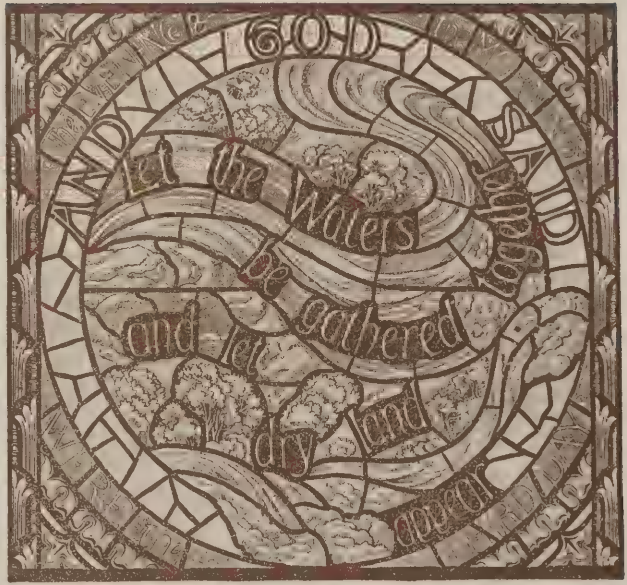
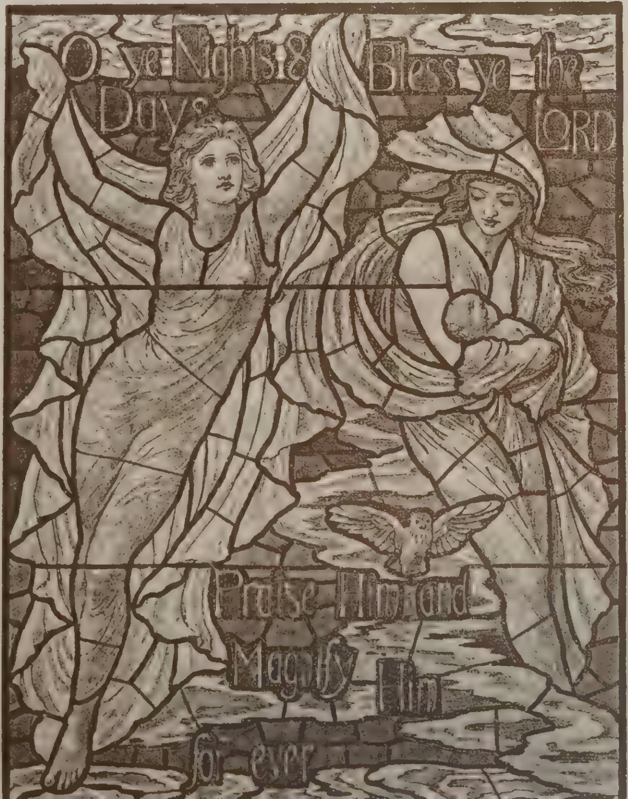
AND GOD SAID
The Spirit of GOD moved upon the face of the Waters
Let there be LIGHT and there was LIGHT
the EVENING and the MORNING WERE the FIRST DAY



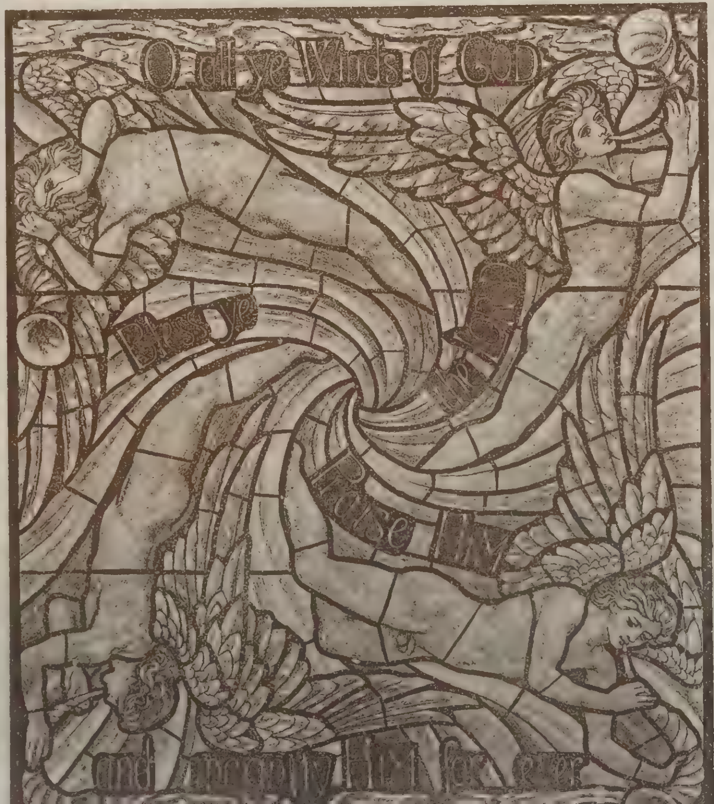
AND GOD SAID
Let there be a firmament in the midst of the Waters
the EVENING and the MORNING WERE the SECOND DAY



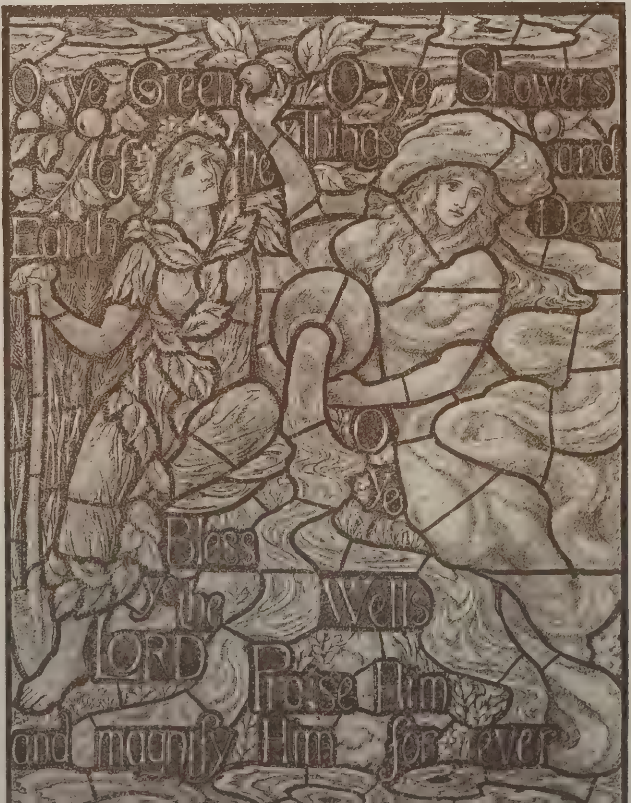
AND GOD SAID
Let the Waters be gathered and let dry land appear



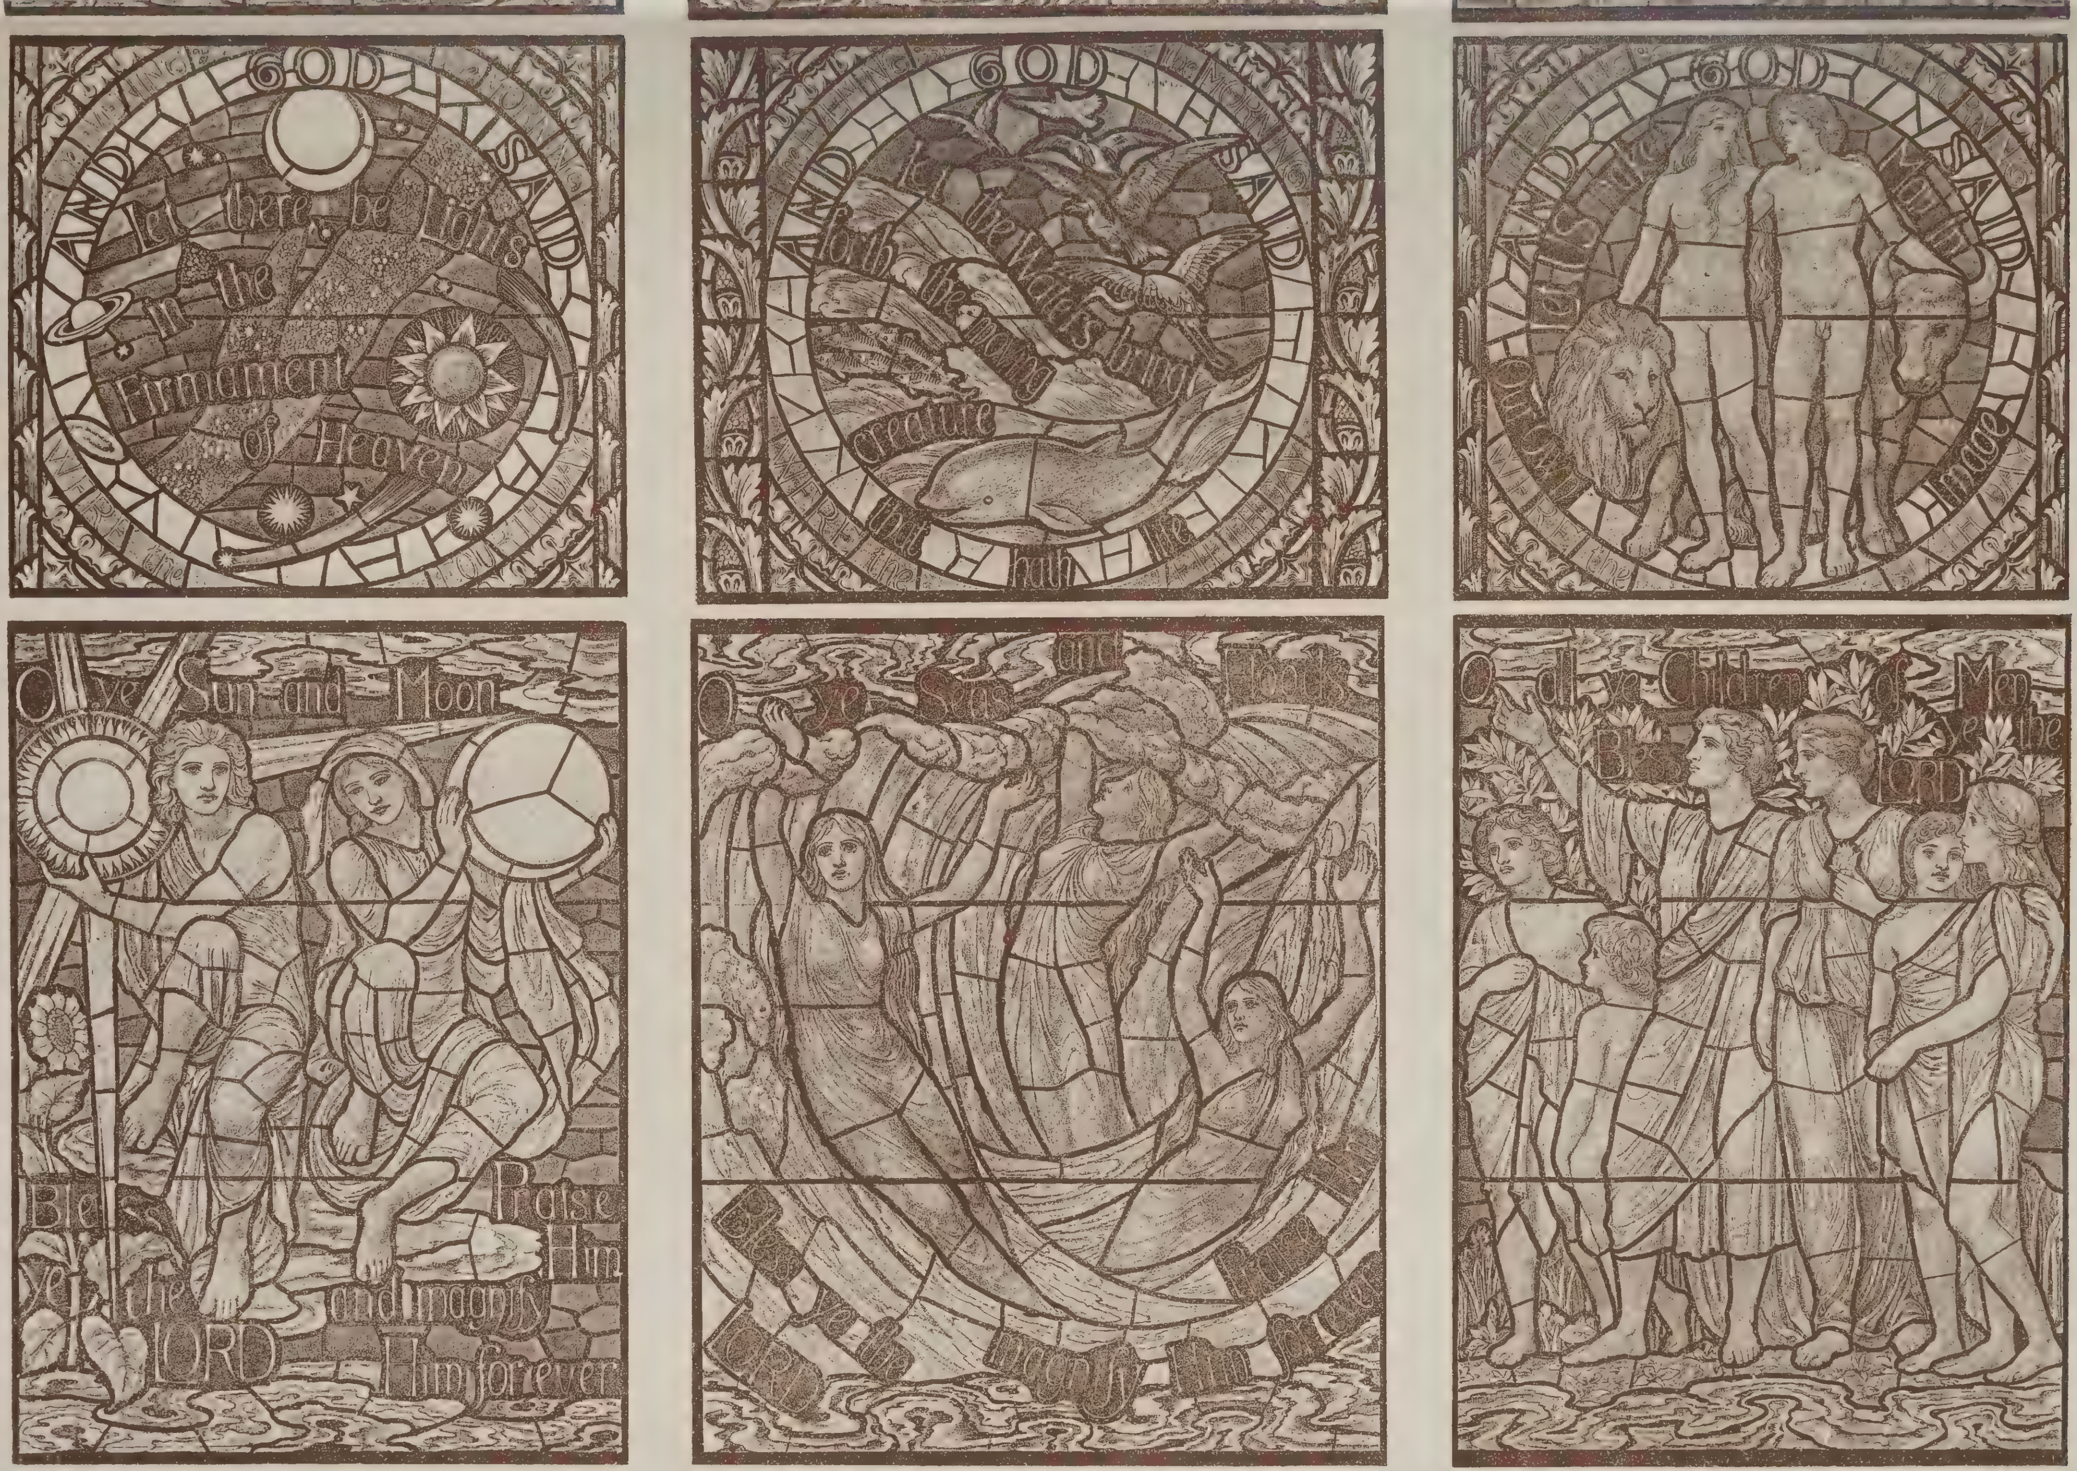
O ye Nights & Days
Bless ye the LORD
Praise Him and Magnify Him for ever



O all ye Winds of GOD
Bless ye
Praise Him
and magnify Him for ever



O ye Green Things of the Earth
O ye Showers and Dew
O ye Wells
Bless ye the LORD
Praise Him and magnify Him for ever



And God said Let there be Lights in the Firmament of Heaven
And God said Let the Waters bring forth the moving creature that hath life
And God said Let us make Man in our own Image
O ye Sun and Moon Bless ye the LORD Praise Him and magnify Him for ever
O ye Seas and Floods Bless ye the LORD praise Him and magnify Him for ever
O all ye Children of Men Bless ye the LORD

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXVII.—No. 2052.

FRIDAY, NOVEMBER 30, 1894.

NEW DEVELOPMENTS.

THE practice of architecture was once confined to the adoption of certain rules and forms of ancient examples, together with a practical acquaintance of the building trades. Everything architectural was, so to speak, crystallised; buildings were looked upon as huge fossil-shells of a primæval epoch; they were drawn and redrawn, classified, and catalogued as if they had been relics of a prehistoric or historic age. Students regarded a great architectural period as they would a cave deposit, or a "valley drift," or a formation caused by glacial phenomena. And it was in this light they studied architecture, just as the geologist would an English cave occupied by man in Palæolithic times. Walls and porticos, columns, and towers were studied as the outward signs of past civilisations, if possible to be reproduced and revivified. The modern revivalist only added the practical knowledge of building to that of the archæologist. How great is the change? Architecture is now regarded not merely as the imitation of the "five orders," the Classic temples, or the Mediæval styles, but as a living art, in which structure and function have superseded the mere reproductive art, capable of giving form and expression to every requirement; and the professor of the art as one who has not only an acquaintance with archæology and building, but with a variety of subjects which have a more or less intimate relation to architecture. Its boundaries have been extended in many directions—wherever, in fact, necessities have forced attention to new structural purposes. The architect is called upon to apply his skill to various kinds of building, and to bring to the task not only knowledge of style and building as an art of construction, but sundry other kinds of technical and applied science—as, for example, hygienic construction in its many phases, the drainage, warming, ventilation, and lighting of buildings. But has he done so with any success? These requirements have been forced upon him from without, because people will have sanitary and healthy buildings. He has scarcely woven them into the fabric of his building, or made himself a master of a number of things. But if architecture is to develop, he must know more of them than he has hitherto done. The modern practitioner is constantly in danger of being pushed on one side by the specialist. This, no doubt, is the danger to be apprehended by every profession, but, by none more so than that of architecture. One way of averting the danger is for the architect to make himself more familiar with certain subjects, instead of leaving them to a brief specification recital as somebody else's work.

As an instance of the neglect of special matters, let us take an electric lighting installation. Not many architects have given it the study it deserves, amongst the recent developments. Yet, after all, it is as much a function of modern architecture to light, well, as it is to build comfortable and ventilated rooms; at least, if we bear in mind our definition of architecture, that it should be functional as well as structural. Good lighting by natural as well as artificial means is quite as necessary as convenience of plan or fitness of structure; they are things which the architect ought to study. And there are two ways of looking at such a matter as an electric installation, which we do not think will be questioned. Firstly, it should be designed to give the best results; and secondly, it should be arranged in connection with the structure, and harmonise with it. These two requirements we may call "Structural and Decorative." The structural requirements of an installation are little understood by architects. They demand certain care being taken, and rules observed to prevent the risk of fire by the use of stranded wires of proper size, so as to have a margin of safety, and to prevent the possibility of an arc being set up at a fracture of wire. Other rules are that conductors or their casings should be placed in sight, and accessible; be properly insulated, that the insulating material be damp-proof, and not soften under a temperature of 170° Fahr.; that where "leads" pass through roofs, floors, walls, and where they cross or are near to metallic substances, like bell-wires, iron girders, or pipes, they should be protected by additional covering; that conductors should be kept well apart. Again, the structural conditions require that switches, commutators, lamps, &c., should be mounted on incombustible bases; that all circuits should be protected by cut-outs. These and other details connected with arc-lamps, switches, dynamos, and transformers form the points of every specification for an electric-lighting installation, and ought to be as closely followed as the description and plans of a scheme of drainage or plumbing. How often are the engine and dynamo fixed as they should be, and on a dry foundation of concrete of proper thickness, quite clear of the walls of the main building, so as to prevent vibration and noise of the engine passing to the walls, often so disturbing to neighbours as to give rise to litigation? Thorough insulation also is required of the armatures, field-magnet, coils, and batteries. Every architect would do well on this subject to specify the rules issued by the Institution of Electrical Engineers.

The decorative side of the question is one equally claiming attention. Yet, strangely, the architect is content to forego his opinion on these matters; he thinks the client or the electrical engineer is capable of deciding upon how the "wiring" is to be done, and what sort of lamps are to be used. These are things he complacently regards as details or fittings, like gas-brackets, or stoves, or door furniture. But they are just as much decorative, and all require the same exercise of taste as the scheme of a wall decoration, if properly considered. They demand a programme, for they are visible to the eye, and will remain an eyesore, or otherwise, for years. Why not give the same attention to the position of conductors, their casings, and the arrangement and shape of the lamps, or their grouping, as is given to the joinery or decoration of a room? The only answer is, Because the architect has not yet come to recognise an electric-light installation as a part of his architectural design. We cannot see why the electric lamp and its suspension or support should not be made as strong a decorative feature as the ceiling ornamentation itself, for the fittings are always visible both during the day as well as night-time, and during the latter they are the only conspicuous centres of interest. The position and laying of mains and branches ought to be shown on the plan, and every lamp indicated, to insure the desired effect. They should start at centres. The "wiring" of a building should, if possible, be arranged by the architect, whatever slight alterations may be made afterwards by the electrician. It should be thought of, especially the casings, before the decoration; these may then be made to form members of the mouldings of the skirting or dado, or even cornice, in every case easily accessible. Thus the casing cover may form a part of the moulded dado or picture rail or cornice, special designs of which in wood are on the market. We have heard of many cases where, owing to bad joints, a considerable leakage has resulted, and where houses have had to be pulled to pieces and the decorations damaged to find out joints at which leakages occurred. The joints, as everyone ought to know, should be well made in dry places, be perfectly insulated, and covered with some waterproof or indiarubber compound. Then the lamps themselves. Many very artistic designs are in the market, but they are not always suitable to the particular style of decoration. No one but the architect himself can properly design these fittings, or select them. Of more importance is their position in a room: and first of all they should be aligned with certain features, if possible, and ought to be so distributed as not to cause objectionable shadows. We often see an electrolier hanging from the flat ceiling surface; it is better, architecturally, to see it suspended from proper centres or ornaments, or at the intersection of the ribs of an ornamental plaster ceiling, which ought, of course, to be designed to suit the positions of the lamps. The concentration of all the main features of an installation is a matter of importance; thus all the joints should be grouped as those of one room, and be inclosed in a box which is easily accessible in case of anything happening to the conductors. This method of collecting, as far as possible, the chief apparatus—as connectors, switches, fuses—is part of the design of a properly considered installation.

Is there not something to learn, also, as to the most effective manner of warming and ventilating a building—where coils and radiators should be placed, how inlets and outlets arranged? All these matters are now left entirely to the mercy of the engineer or apparatus fitter, because architects will not take the trouble to show where they ought to be placed. The position and form of stoves, coils, and radiators, or those of ventilators, ought to receive as much attention as the arrangement of doors and windows, and they would do so if once the architect began to realise that warming and ventilation were as much a part of his design as that of a general plan.

A large hotel or block of residences is, so to speak, a great factory for the generation and distribution of heat, of light, of water. Its heating, ventilating, and lighting plants form a very considerable proportion of the expenditure, and on pecuniary grounds the architect can hardly be justified in handing over these plants to the outsider, as he often does. The engineering equipment of a large building is often placed in the hands of the consulting engineer, who prepares the design and superintends the erection of the apparatus. The architect, if he has not been engaged in the inception, can scarcely interfere with the arrangements or designs of the contractor while the work is in progress. Specifications tell a tale in this respect. The phrase "provide and fix" seems to be the only one which aptly expresses the architect's intention. What and how to fix are left to the imagination of the contractor or sub-contractor, and much to his satisfaction. The definite specification is the enemy of the scamping tradesman, for he cannot by any effort wriggle out of clear and precise instructions; but the exact specification is only the result of being able to master the requirements. It is an easy matter to order, to describe what is wanted in a perfunctory manner, to specify goods or patterns numbered in a catalogue; but not by any means easy to give definite instructions as to design and arrangement. Developments in architecture, whether in the direction of new materials or in the art of applying scientific knowledge to buildings, must be the result of making ourselves masters of subjects which at present are considered distinct trades with which the profession are thought to have little or no concern.

HAMPSTEAD PUBLIC LIBRARY COMPETITION.

THE Public Library Commissioners for Hampstead have received four designs for their proposed library, to be built on a site at the corner of Finchley-road and Arkwright-road, Hampstead; these are now on view at the vestry-hall, Haverstock Hill. Owing to the circumstance that the competing architects have sent in under their own names, two of them being men of standing in the profession, there appears to be naturally a strong desire on the part of some of the members to award the prize to one of these gentlemen. We understand also that Mr. Christian has advised the commissioners, but as to what course they will pursue, or whether they will agree to the recommendations of the assessor, remains a question of some moment. In such a case there is a natural desire, though by no means obligatory on a committee, to accept a design by a well-known architect. The magic of a name is a powerful incentive sometimes to act contrary to the better judgment of the committee, and we, therefore, hope the commissioners will consider the question of selection with unbiased minds, and select that design which is appropriately adapted to the site and its considerable fall to Finchley-road, and is at the same time handled with sufficient picturesqueness to harmonise with the character of the locality. The site is rectangular; but the narrow frontage facing Finchley-road runs askew at a wide angle.

The design submitted by Mr. Basil Champneys, M.A., is simple and picturesque, characterised by features which may be met with in old buildings of the 17th century—a blending of Late Gothic and Classic—and this design has been treated with some regard to balance in the main, or Arkwright-road, front, though the elevation, especially that facing Finchley-road, which is the narrowest frontage, may be rather mistaken for an old residence. Mr. Champneys is a master of this particular phase of our old vernacular architecture, and his very success as an artist may be rather prejudicial to that sense of official dignity or appropriateness which many wish to see imparted to buildings of this kind. The plan is well conceived and compact, and the author has provided good control over the departments. The main entrance, through a semicircular porch, with a half-cupola supported on two disengaged Ionic columns on a platform of semicircular steps, occupies the centre of the Arkwright-road side, and is sufficiently high to give a good basement towards Finchley-road, used for bookbinding and repairing, and large stores below hall and lending library. The slope of ground is thus utilised, while it raises the ground-floor level to a commanding height. Through the porch we enter the front vestibule, having an assistant's room to the right and a staircase, with porter's box, on the left side, the latter so contrived as to overlook the hall and entrance. The entrance-hall, 32ft. by 21ft., is lighted by a lantern, straight with and beyond which is the lending-room, divided from the hall by a glass screen. Another lantern is placed over the counter, and several windows on the north side. The newspaper-room, 73ft. by 25ft., occupies the left side, lighted by two segmental bay-windows from Finchley-road, and has a magazine-room at the further end, divided by a screen. On the right-hand side of hall, and corresponding in size, is the reference library, 62·3ft. by 25ft., with connecting doorway between it and lending library, so that the same attendant can serve the visitor in either department. A counter is here also introduced, with librarian's room in the rear. The reference-room is top-lighted, and also has three windows at the end facing Arkwright-road. Adjoining and close to the library, separated by a straight wall, is the lecture-hall, 55ft. by 37ft., having a direct and separate entrance from this road, and a top-lighted corridor along the outer boundary. A rectangular-shaped stage and retiring rooms are at the north end. A gallery at end of lecture-room is shown. The caretaker's rooms occupy the first-floor story to Arkwright-road, and are partly in roof, and have hipped dormers. Over the centre an octagonal open wooden turret rises. Further accommodation is indicated by raising the caretaker's rooms one story, and by adding library and board-room along both fronts on the first floor. We notice that the rooms are well lighted, and the librarian or his assistant has, by observation windows and doors, supervision over the department. The block of building is set back square from both fronts, and leaves a rather waste space or triangular area opposite Finchley-road. The passage and ramped wall to the main entrance is useful. We notice the roofs of departments are of timber and plaster ceiled, treated very plainly.

We next come to a very able design by Mr. Arnold S. Taylor, which, although in a more expensive style, is distinguished by many good points. The author has treated his buildings in a Late Perpendicular or Tudor style, which at least has some pretensions as one harmonising with the surroundings, and allowing the plan to be broken towards Finchley-road, thus making the most of the oblique angle of boundary. The steep inclination of the ground has been met by a bold stepping of the buildings, the lecture-room being the highest and slightly projecting, with its lobby entrance in Arkwright-road. The plan is well arranged for light. The main entrance in the latter road gives access to a central hall, top lighted by lantern, and open area. On the left is the newspaper and magazine room, in two parts —one 38ft. by 29ft., and the other 46ft. 6in. by 29ft.—lighted by windows and bays in both fronts. The lending library, opposite entrance on the north side, is 55ft. 6in. by 30ft., with lobby space and counter; and the reference library, 54ft. by 30ft., is in a line with the lending library, its gabled end abutting on Finchley-road and projecting. There is a side entrance from the north side, with passage between these two rooms. The librarian has a room on the east side of entrance. The lecture room, on the east side, with front entrance from Arkwright-road and side corridor, is 79ft. by 30ft., with platform and retiring rooms, &c., approached also from the passage on the north and from the library buildings. The supervision is, perhaps, the weakest part of plan; but the plan and drawings show evidence of careful thought. A waiting-room is provided at the side of hall, which is a good feature, and the plan is architecturally arranged. The bay windows in newspaper and magazine room are also features of merit. A caretaker's entrance is placed between library and lecture-room, and his rooms are near the lecture-room end of library on first floor. A skylight is shown over the reference library. One point worth notice is that the author has provided a good book-store, &c., in the basement at the Finchley-road end, that could be turned into a lending library for the present, and save cost. The perspective and elevations are well drawn in ink, and the design is dignified, and the parts well broken to the main roads. Open-timber roofs to library and lecture-room, and plaster ceilings to magazine and reference reading-rooms, are shown. The windows are mullioned, and parapets are shown over the principal bays.

The design of T. G. Jackson, A.R.A., is also a picturesquely-treated group of buildings with Queen Anne or Georgian features, as in the long brick pilasters and elongated window openings facing Finchley-road. This front is terminated by octagonal angle turrets, forming bay windows internally, roofed with cupolas of ogee shape. An India-ink perspective sketch accompanies. The long front to Arkwright-road is broken in outline by a low roof over newspaper-room and by the gable end of lecture-room and projecting staircase of gallery. Mr. Jackson separates his library block from the lecture-room, though connected by a passage. The library block is not square, the Finchley-road front being slightly turned in the direction of the boundary. This awkward turn is concealed by the large octagon tower at the corner, and to disguise the lines of internal plan at their junction an elliptical-shaped central hall or waiting-room is shown, and this hall gives access to each department. The lending-library at the corner is well lighted by windows on both fronts and the large octagon bay, the reading-room adjoins it on the Finchley-road front, and the two departments are connected by doors or a lobby at the foot of staff staircase. On the north side of hall is the librarian and board-room, and the magazine and news-rooms are on the east side, both well lighted. The lobby or space for borrowers from centre hall is convenient, and well lighted. The lecture-room, which is detached except by a corridor from central hall which passes through news-room, has an apsidal platform end, with gallery over, and entrance, with conveniences, for both sexes from Arkwright-road. There is also a side corridor and retiring rooms next east boundary. The main entrance and central hall have an awkward appearance on plan, on account of the twist in the two main axes of building. Towards Finchley-road the ground floor is utilised for stores and binding, coal and boiler-house. The staff entrance between the lending and reading-rooms is convenient. The drawings are rather rough, but the perspective ink sketch shows some picturesque grouping towards the long frontage, the high and low roofs, broken gables, and turret cupolas giving a pleasing outline to the mass, but hardly, perhaps, regular enough.

The design submitted by Mr. Horace Field has a good central hall, lobby, and lending-room arrangement, with a long newspaper and magazine room, lighted from Finchley-road with circular bays; this room is about 76ft. long and 30ft. wide, broken by columns and divided by glazed partition. The reference library is on the east side, the front end of which can be utilised as a corridor to the lobby of lecture-room, which latter is 64ft. by 30ft. on the east side, adjoining, and has a circular recessed platform, with cloak-rooms, and two entrances from Arkwright-road, the eastern one running along as a corridor. The plan has very much that resembles Mr. Champneys' in arrangement. Further extension is provided for by an addition of a first floor. The external design is Italian in feature, the lines level throughout, and not well suited to the fall of ground, and there is certainly a resemblance to a large stable range in the long front. From what we have said, it may be inferred that there are two designs which appear to meet the requirements in plan, both are picturesquely treated—one in a pure and more dignified style, and a little more costly than the other—and it is for the commissioners to make a choice, guided, of course, by any professional opinion they may have heard.

THE ARCHITECTURAL ASSOCIATION.

THE fortnightly meeting of the Association was held on Friday evening, the President, Mr. E. W. Mountford, F.R.I.B.A., in the chair. The following 39 new members were elected:—Messrs. L. D. Philpot, F. J. O. Smith, H. A. Chapman, C. Bree, G. B. Carvill, G. W. Cleave, J. S. Dunn, F. R. Ireson, C. Martin, A. Smithers, E. W. Allfrey, G. Bailey, N. C. Bathurst, T. Bee, A. R. Carey, E. F. Cobb, C. F. Dawson, R. E. Eddison, H. C. R. Hide, E. T. Marriott, C. H. Fowler, H. Mennie, R. J. A. Shield, R. S. Balfour, P. R. Bradford, H. R.

Creighton, V. Esch, F. V. Forrest, G. T. Forrest, S. J. Hulse, E. C. Haskins, E. W. Hobkirk, A. G. Pile, E. W. Pugh, F. C. Thompson, and S. Towse.

THE SANITATION OF HOSPITALS AND INFIRMARIES.

Mr. Keith D. Young, F.R.I.B.A., read the following paper on this subject:—What is there, he asked, in the sanitary conditions of a hospital which so differentiates it from an ordinary dwelling-house as to render it necessary or desirable to treat it as a subject in itself? The essentials of sanitation, a clean and dry site, substantial and dry walls, a roof that is weather-tight, and drainage and plumbing arrangements of sound construction and properly devised—surely these are as necessary to the smallest cottage as to the largest hospital. This is all perfectly true; but there are conditions affecting the health of the inmates of a hospital which are to be found in no other kind of building, and which lie at the root of all questions of hospital sanitation. And it is upon these special conditions peculiar to hospitals that I propose to speak to you this evening. In the first place, then, it is essential that we should have a clear understanding of what a hospital is: that is the very root of the whole matter, and the want of a true knowledge of it has been, and still is, the cause of much disaster. For our purpose to-night it will suffice if we divide hospitals into two classes:—1st, those which exist for the benefit of the patients; and 2nd, those which exist for the protection of the community. In the first class are comprised all those hospitals known broadly as general hospitals, including also the majority of special hospitals; and, in the second, hospitals for the treatment of infectious fevers. In the first class, then, we have a group of buildings which are devoted to the treatment of sick and injured poor. In these hospitals a large number of patients are gathered together, very often literally under one roof. But it is not to the advantage of the patients that they should be congregated together in large buildings or in large wards; but, on the contrary, this very fact is an element of grave danger to the patients themselves. The ideal hospital is one in which each patient should be treated in a ward by himself, entirely cut off from all possibility of aërial connection with any other ward. This is, of course, an economic impossibility. The air of a hospital ward is liable to contamination from the following causes:—1. The evacuations or effluvia from the bodies and excreta of patients. 2. The presence of suppurating wounds, with their necessary dressings, poultices, &c. 3. Foul linen, bedclothes, &c. And these necessary and unavoidable conditions common to all hospitals may be aggravated, and their danger intensified by:—(*a*) Insufficient air-space, (*b*) insufficient ventilation, (*c*) inadequate or improper arrangements for the removal of refuse of all sorts, (*d*) faulty arrangement of buildings. To illustrate the truth of these propositions, I will take two examples of hospitals which may serve as object-lessons in hospital hygiene. My first example is the famous old Hotel Dieu at Paris, as it existed at the latterend of the eighteenth century. The plan was that of one vast ward running the whole length of the building, and containing 168 beds, of which 118 were for four patients each, giving a grand total of 552 patients. On the south side there were no windows at all, whilst on the north the windows must nearly all have had their sills above the ceilings of the adjacent rooms. This sort of thing was repeated on three upper floors with slight variations, and in addition to this building there were other wards on the opposite bank of the Seine, and on one of the bridges connecting the two sides. The latrines were in close proximity to the wards, and were insufficient in number. Within the walls of this vast pest-house were gathered not only ordinary sick, but patients suffering from infectious and contagious diseases of all sorts, lying-in women and lunatics. And the immediate result of this state of things was that one patient out of every four died. My second example is the old Lincoln County Hospital, which may be contrasted with the building which replaced it, and which is still one of the best examples, twenty years old though it be, of a good county hospital. In 1863, when this hospital was inspected by Mr. Timothy Holmes, it was a building of irregular structure, a great part of it being nearly a century old. Like most hospitals of that period, it was "composed of small wards not so much ill-provided with window space as having their windows improvidently placed for hospital purposes, the windows being wide and low, and at one or at two contiguous ends of the wards, so that it became necessary to crowd the beds together away from the windows." In the older part of the hospital the floors were of plaster, than which a worse material for the purpose can scarcely be imagined. Contrast this with the plan of the present hospital, the work of my friend, Mr. Alexander Graham. Note the long and narrow wards, each bed with its proper complement of light and air, the offices properly disconnected from the wards, the latter from the administrative offices, and the laundry and mortuary duly isolated from every other part. Insufficiency of air-space and insufficient ventilation are closely allied, and must be considered together. Air-space, indeed, is of little value by itself unless it is accompanied by ample means of ventilation. And by air-space I mean not only cubic space, but floor-space—a most important point to note. It is useless to supply your patients with a generous amount of cubic space unless you first see that they have sufficient floor area. The question of ventilation cannot be considered apart from that of warming. The two are interdependent, and cannot be separated. Ventilation, then, means the supply of fresh air, warmed to the requisite temperature, and in sufficient volume to preserve a given standard of purity without producing draughts. The rule generally adopted in practice is that each patient should have a supply of 3,000c.ft. of air per hour. This amount is requisite in order that the total impurity of the air may not exceed ·66 per 1,000. To accomplish this without draught, the air of the ward should be changed not oftener than three times per hour, which gives a minimum allowance of cubic space of 1,000ft. per head. It it very difficult to lay down any fixed rules for determining the necessary allowance of cubic space. The nature of the disease treated, and the situation of the hospital, must be taken into consideration. In a country hospital, where the cases are for the most part of a mild or chronic nature and the site is open, 1,000ft. may often suffice. Where the average of acute cases is greater, and a hospital is in the centre of a big town, more cubic space is required; and in hospitals in manufacturing towns, where severe surgical cases are frequent, 2,000ft. is not excessive. Ventilation is commonly divided into two classes—natural ventilation and mechanical or artificial ventilation. In natural ventilation the agency of windows and other openings, aided by the upcast power of the smoke-flues from open grates, is relied upon. In artificial ventilation the air is either pumped in by mechanical appliances and allowed to escape through openings or shafts constructed for the purpose, or it is sucked out either by fans or by the aspirating power of heated shafts. In either case the air must be warmed before it enters the ward. It would be impossible for me to describe the many systems which have been devised for the ventilation of wards by mechanical means in the time we have at our disposal this evening. The object, however, of each is practically the same—namely, to insure a regular and automatic change of air in the ward by mechanical means, altogether independent of windows. The question which concerns us is this: Is there any evidence to prove that wards cannot be kept sufficiently sweet and healthy without recourse to expensive automatic appliances? So far as the experience of hospitals in this country goes, I think that not only is there no such evidence, but that there is some very definite evidence in support of the exact converse. There is a case cited by Dr. Bristowe and Mr. Holmes in the report to which I have before alluded, which goes to prove that mechanical ventilation can become a positive evil. I allude to the York County Hospital, which, when it was erected, was furnished with an apparatus for warming and ventilating by a mechanical process by which the air was warmed in the basement and driven into the wards by the aid of a steam-engine, the vitiated air being carried off by shafts warmed by hot pipes. The wards were not provided with fireplaces, and the windows were mere apertures for light, and were not made to open. This system remained in work for nine years. During that time it was said that the wards were always close, sickly, and even offensive; and erysipelas increased to such an extent, and proved so often fatal, that the surgeons gave up operating altogether, preferring to abandon their patients to disease rather than risk operations with almost certainly fatal results. The system was abandoned, fireplaces constructed, and windows made to open. When this was done erysipelas disappeared, and the health of the hospital became what it ought to be. No doubt in this case the apparatus itself was deficient. I give the case for what it is worth; but it is not without its value if only to show how mischievous such a system can be if improperly devised. To return to our question: Is artificial ventilation necessary? To prove that it is necessary we must assume that the ordinary means of ventilating by open windows is inadequate. Now, I venture to affirm that there is no evidence whatever in support of such an assumption. A distinguished Paris surgeon, Dr. Le Fort, in 1862 published a report on Hospital Hygiene. He there compares the mortality in London hospitals with that of the Paris hospitals, very much to the disadvantage of the latter, and professes himself decidedly in favour of the natural means of ventilation adopted in London to the artificial systems in vogue in some Paris hospitals. But he says one need not go to England to search for means of comparison between the two systems; for the two hospitals in Paris where the mortality is greatest are precisely those in which artificial ventilation is employed. And this, remember, was at a time when antiseptic treatment was unknown, and the paramount importance of cleanliness was not recognised as it is to-day. The matter appears to me to be very fairly stated by Sir Douglas Galton in his book on "Hospital Construction":—"The system of propulsion for hospital ventilation (he writes) has not found general favour with hospital architects or managers in this country. There is one very patent and valid reason, which is that in this climate windows can be kept open; and when windows are open the volume of fresh air which passes through a ward will be at least twenty times greater than either the theoretical 300c.ft. per hour, or even the 5,000c.ft. or 6,000c.ft., which some of these systems profess to furnish, without entailing the large expenditure of fuel necessary for moving a large volume of air." So, also, Dr. Bristowe and Mr. Holmes, in the report to which I have already alluded:—"No amount of cubic feet of space, no plan of building, no artificial system, no combination of these adjuncts to a good ventilation has ever been found to replace open doors, windows, and fireplaces; while provided with the latter, which are the essentials of good ventilation, many old crowded defective hospitals have maintained for a long series of years an amount of success which the most eminent examples of scientific construction have never found practicable." Everyone who has any experience of hospitals in this country knows that there are very few days in the year during which ward windows cannot be kept open—and I cannot think it justifiable for the sake of those few days to establish a complicated system, involving a certain amount of skilled labour in working and considerable cost for maintenance; a system, moreover, which must involve the construction of a number of shafts, all of which, unless kept scrupulously clean, must become harbours for filth and a constant menace to the health of the patients. If I were to presume to lay down rules for the proper method of warming and ventilating a ward, I should say, apply your warmth, or the greater part of it, around the outside walls of the ward, where the greatest leakage takes place; whether the method be by steam or hot water, take care that every pipe or coil is so placed that it can be cleaned easily and all round; if any arrangement is made for the admission of fresh air at the back of a coil, see that the shaft can be readily got at and cleaned; and let no shaft for the passage of air be longer than the thickness of the outside wall. Before I leave this subject of ventilation, there is one special point it is necessary to notice. This is the sterilisation of air from fever wards. There is one kind of fever, and one only, of which it can be said that the sterilisation of air expelled from the wards is necessary in the interests of public health, and that is small-pox, a disease of which we have convincing proof that it can and does spread beyond the walls of the hospital; that the specific infection of it is in fact air-borne. And for this reason it is distinctly desirable that some means should be devised for rendering innocuous the air from the wards. The nearest approach to the accomplishment of this task has been made at the Bradford Corporation Hospital, where, under the direction of the architects, Messrs. Morley and Woodhouse, an apparatus has been constructed, and since patented by Mr. Edward Oldroyd. The system, to describe it very briefly, is this: Fresh air, capable of being warmed when necessary by passing over hot-water pipes, is admitted to the wards in the floor at the foot of each bed, and also at certain points in the opposite wall. The whole of the vitiated air is drawn from the ward through openings at the ceiling-level into a trench, at one end of which is a powerful furnace; part of this air is used to promote the combustion of the fire, the remainder being passed through the furnace and exposed to a temperature estimated to be 800deg. Fahr. All the windows in the ward are hermetically sealed. For sufficient reasons I am not able to put before you any statistics as to the success of this system. The proof of success in an appliance of this kind is a matter for the bacteriologists and the microscope; and we have yet to see whether a ward constructed after this fashion fulfils every requirement, not only of the sterilisation of the air, but also as a suitable place for the treatment of smallpox. But there is no justification whatever for applying such a system as this to wards for scarlatina, or any other infectious fever which does not spread beyond the walls of the hospital. Our next point is that insanitary conditions may be produced by inadequate or ill-conceived arrangements for the removal of refuse. The methods of sound drainage are the same in a hospital as in any other building, and the neglect of them leads in both cases to similar disaster. There are, however, some points special to hospital work which require to be noted; and there is other refuse besides what is carried away by the drains which equally requires to be disposed of with care. In every ward for acute disease there must always be a certain number of patients who are unable to get up, and who must perform every office of nature in bed. For the proper emptying and cleansing of the vessels necessary for these purposes there must be provided a sink, which is commonly called the slop-sink. The sink should be so constructed that the risk of splashing is, if not abolished, reduced to a minimum, while at the same time a copious flush of water should be provided. The only slop-sink that I know in which the difficulties of the situation are intelligently met is the one devised by Professor McHardy, and called after him by the patentees, Messrs. Dent and Hellyer. The bed-pan is placed face downwards, with its nozzle inclining towards the outlet of the sink; a jet of water is then projected upwards from the rose underneath the sink, and flushes out the whole pan, the pan itself being held in position by the indiarubber strips at the sides of the sink. To flush out the sink there is a flushing-rim, the water to which is turned on by a separate handle. There is a separate jet for flushing out urinals, and a metal cradle was devised for holding these vessels; but the latter is an encumbrance, and is not at all necessary. The room in which this sink is fixed should be of sufficient size to hold not only the slop-sink itself, but an ordinary porcelain sink for washing other vessels, such as spittoons, porringers, &c., and sufficient shelving to hold the ward crockery. As a rule, these rooms are made far too small for the work that has to be done in them. In all sanitary fittings, including water-closets, sinks, lavatories, and baths, simplicity of form and cleanly appearance are desirable. They should also be, as far as possible, self-cleansing, and all casings of every kind should be dispensed with. In operation theatres, where, above all things, minute and excessive cleanliness is of the last importance, it is well to make all shelves of glass, not only that the state of the underside, as well as of the upper, can be readily seen, but also because glass is perhaps the only material not liable to injury from the acids used in the theatre. I have referred to kinds of refuse not liquid. I mean by that not only the household refuse, dust, ashes, kitchen-stuff, and so forth, but ward refuse, such as bandages, dressings, poultices, and the like. In a general hospital the ordinary household refuse may be consigned to the care of the parish dustman; but it should be collected and stored in iron bins, for which a suitable shelter not near any ward should be provided, and it should be removed daily. Kitchen-stuff in a general hospital may also be separately stored and disposed of. But in a general hospital all the ward refuse, and in a fever hospital all refuse of every kind, should be burnt in a properly-constructed furnace. This furnace must be so constructed that the gases resulting from combustion are destroyed or decomposed before reaching the smoke-flue. Such an apparatus has been devised by Mr. Brophy, of the firm of Slater and Co., and is in use at the Middlesex and the London Fever Hospitals. With regard to drainage generally, I will only add a word to impress upon you the extreme value of flushing. You can hardly have too much flushing power in hospital drains—or, for the matter of that, in any drains. If there is a laundry, the waste water can very well be taken to a flushing-tank, and utilised for flushing the drains by means of one of Mr. Rogers Field's siphons. Of course, care must be taken to intercept the large quantity of shreds that invariably get detached from the clothes in the process of washing. I now come to my last point, which was faulty arrangement of buildings. I have already indicated, when comparing the old and the new Lincoln Hospitals, the main features of malconstruction. What is called by Dr. Erichsen the "big house system" is the sort of plan upon which so many of the larger provincial hospitals and some of the London hospitals were built, notably University College Hospital, where Dr. Erichsen's well-known lectures on Hospitalism were delivered. In extreme contrast to this we have such a building as the Eppendorf Hospital at Hamburg, where every ward is an absolutely isolated building, and not even a covered way exists on the site. The enormous cost, both for land, buildings, and administration, of such a system could only be justified on grounds of absolute necessity. For myself, I fail to see the necessity; nor do I know of any sufficient reason for limiting the wards to one story in height, as is done at many other recent foreign hospitals besides the Hamburg one. Provided you so construct your wards that each ward is cut off from direct air communication with the other wards and with the other parts of the hospital, provided that there is ample open space for all purposes of light and ventilation, it seems to me to be quite immaterial whether they are two or three stories high. As an example of how wards should be isolated one from the other, I may name the new hospital now in course of erection at Derby. The wards are cut off from the corridor and from the staircase by short lobbies, which are, in fact, but covered bridges, with only just sufficient height for head room, and with free air space between the roof of one and the floor of that above. The corridor must, of course, be kept warmed at or about the same temperature as the wards; if this is done, and ample inlets for air are provided in the latter, there will be no suction of air from corridor to ward. The ward itself must be as simple in construction, and as cleanable in all its parts, as it is possible to make it, and should contain nothing but the most necessary furniture. Suitable store-rooms must, therefore, be provided outside the ward for food, for linen, and for patients' clothes, and an orderly closet for brooms, pails, and other things necessary for daily use in the ward cleaning. Mouldings must find no place in a ward or in any of its offices; angles, whether vertical or horizontal, must, wherever possible, be hollowed; in vertical angles to promote circulation of air and avoid stagnant corners, and in horizontal angles for facility of cleaning. In the construction of ward floors, solid or so-called fireproof construction is essential—and after much consideration and comparison of different kinds of floor surfaces I am inclined to think that carefully-laid terrazzo is the best thing to be had. Hard-wood floors, laid in block fashion, are apt to tilt up with the weight of a bed, plus a heavy patient, and the joints, however well made, will open in places. Terrazzo, when well laid, and when care is taken to have a sufficient thickness of concrete over the iron joists, gives a solid, homogeneous surface that is hard to beat. I know I shall be told that it is cold to the feet; but any slight inconvenience that may be felt from this cause can very easily be remedied. A point of importance in regard to windows is that a window should always be put between the end bed and the end wall. This window may be as narrow as you like, but it must not be omitted. The necessity for this arises from the fact that these corner beds have been found to be less favourable to the well-being of patients than the other beds, owing, no doubt, to defective circulation of air round about the patient. The water-closets and sink-rooms must, of course, be properly cut off by cross-ventilated lobbies from the wards. This point is pretty generally recognised to-day. But what appears to be too often lost sight of is, that if it is necessary to take this precaution with regard to one closet, or set of closets, it is equally necessary to do it with every other. In a late competition for a large hospital, I remarked several instances of the neglect of this obvious principle. In one case a two-bed ward had its closet opening practically into the ward, and in another otherwise excellent plan the water-closet for the use of the nurses opened directly out of the ward corridor. I fear I cannot give you any counsel of perfection for the finishing of wall-surfaces in wards. The perfect wall-surface has yet to be invented; meantime, I doubt if we can do better than a good Keene's cement surface, painted and varnished. If it is necessary to isolate wards from one another, it is of vastly more importance to separate the out-patient department, the operation room, the laundry, and the mortuary. The out-patient department must be a separate building, and the only reason for any covered communication existing between it and the wards is, that the dispensary must be in touch with both. Or, to put it in another way, the dispensary must be part of the out-patient department, and to avoid having a second dispensary in the hospital proper, it must be also accessible to the nurses. Equally necessary is it that the operation-room should be carefully isolated from all possible chance of air-borne contamination from any other part of the hospital. So far has this principle been carried abroad, that in one hospital in France the operation-room is a detached building in the garden, and patients are conveyed to it through the open air in a specially-constructed litter. This is carrying asepticism to an extreme that probably would not be upheld by any surgeon in this country. But it will be agreed that where possible the operation-room should be a one-story building, and cut off by a lobby from direct communication with the main corridor. Inside the operation-theatre, everything that makes for perfect cleanliness and consequent asepticism must remain supreme. A floor of the best terrazzo, walls either of marble or enamelled tiles, and well-painted and varnished cement ceiling, metal window-frames flush with the walls, and hard-wood doors, every part must be so made that the whole room can be if necessary swilled down with a hose. The fittings need careful consideration. For shelves the best material is glass. Neither pipes or anything else must be fixed up against the wall so that they cannot be readily cleaned all round. The laundry, again, must be an isolated building; it may be connected with the administration block by a covered way open at the sides, but even this is not an absolute necessity. The mortuary building should be as far away from the rest of the hospital as possible. An essential part of the mortuary building is the post-mortem room, and here the aseptic precautions, which in the operation-room are necessary for the sake of the patient are, to a lesser extent, perhaps, necessary for the sake of the medical officer. A post-mortem room should be as cleanable in all its parts as an operation-room; and the materials used in its construction, while less costly, should be of a hard, non-absorbent nature. For the walls glazed bricks, and for the floors cement or asphalte are most suitable, while the table itself should be of a hard marble, polished, and supported on a framework of iron. The floor should be drained by an open channel provided with an efficient flushing-tank and covered with a movable iron grating. In conclusion, let me summarise the essentials of hospital hygiene so far as the building is concerned. Perfect cleanliness in every part is the keynote, the beginning and the end of hospital construction, and to this every part must lend its aid. There must be no lurking places for dust, no hidden recesses where foul things may be stored out of sight, no avoidable projections, or ledges, or mouldings to catch the dust, or cased-in pipes or shafts for foul linen or lifts. The patients must be safeguarded from infection from each other, from the out-patient department, the laundry, and the mortuary; from the evil effects of ground-air, foul drains, or dust-bins. And in a word, every part of the establishment must be contrived with a view to facilitate that "exquisite perfection of cleanliness" which is the true secret of a healthy hospital.

Mr. Alexander Graham, F.S.A., in proposing a vote of thanks to Mr. Young, remarked that the late Sir John Pringle, an early sanitarian, used to say that patients made better and quicker recoveries in old buildings than in the best appointed hospitals of his day. There was little improvement in hospital arrangements until after the close of the Crimean War, and then some attention was given to the principles laid down by a little band of reformers, of which Sir

Douglas Galton and Miss Florence Nightingale were among the few survivors—principles which would hold good to all time. When the late Sir Gilbert Scott designed the Leeds Infirmary, one of the first hospitals constructed on the pavilion principle, many errors were made, which had afterwards to be corrected at a great outlay. Hospitals might usefully be divided into those for towns and country places, for the conditions of those classes were very different. It was a good rule not to place more than 50 patients upon an acre of ground; but in crowded districts, where hospitals were most needed, so large an area could not be provided. In ventilating hospitals the problem was to avoid draught in changing the air. In ordinary cases the air of a ward should be changed at least three times an hour; but it was difficult to lay down hard and fast rules. It was much more important, as Mr. Young had said, to regard floor space than cubical area in calculating the areas of wards. Cubic space would indeed regulate itself if sufficient room were provided between the beds. In competitive designs he had noticed as an assessor that competitors were too apt to provide the required cubical space per patient in height. The late Professor De Chaumont regarded any height above 12ft. as unnecessary in a ward, but his own rule was to allow 14ft.; where a ward was very wide, say 28ft., even 14ft. would look low. He was very glad to hear Mr. Young advocate natural means of ventilation. If an architect trusted to his windows and fireplaces to provide change of air, he could always secure a fresh current in the ward, summer or winter. He had never heard of an application of a mechanical system of ventilation that acted perfectly at all times and seasons of the year, and he was quite certain that such systems were very expensive. As to the sterilisation of effluent air, this could only be necessary in the case of small-pox wards. The drainage of a hospital should be carried out on the same principles as that of a house; he recommended MacHardy's slop-sink as a good kind. Simplicity of form was desirable in every sanitary appliance, and there must be not only cleanliness, but, more than that, an obvious appearance of cleanliness. In American hospitals, he had observed that copper and brass were used for all pipes, and these were kept burnished, while glazed tiles were employed for wall surfaces. These looked very nice, but entailed much labour and were extremely expensive. He would point out that the flushing siphon and tank should be so planned as to be close to the head of drain. For flooring wards terrazzo was a bold experiment—the material was certainly cold to the feet. He had himself always advocated teak floors, treated by paraffin and then dry polished, the joints being, of course, carefully filled in. In New York he observed tiles used for flooring; but they, like terrazzo, seemed a cold surface to walk upon. For wall surfaces, he concurred with the lecturer that Keene's cement, painted and varnished, was the best. The use of glass for fittings had much extended, and all shelves should be made of this material. It had been stated that glass had been introduced for the walls of operating theatres, but he knew of no example either in this country or abroad. In conclusion, he would point out that the contemplation of cheerful surroundings was a great help towards effecting a cure, both in physical and mental disease, and if the outlook of the windows of a ward was depressing and ugly, the glass should be obscured.

Mr. P. Gordon Smith, architect to the Local Government Board, seconded the vote of thanks. It was a delicate matter to touch upon the merits of ventilating systems, for an architect's opinions were liable to be taken up, repeated, and sometimes slightly distorted by competing firms. In the main, however, he could endorse all that Mr. Young had said; the best system of hospital ventilation was one that depended almost entirely on the doors, windows, and fireplaces of the ward. With double-hung sash-windows and fanlights above, there should be no difficulty in securing efficient ventilation in a ward without having recourse to special appliances. He held that in every hospital there should be an official specially appointed as an officer of hygiene, whose duties should be to see that every place was clean, that the ventilation was efficient, and that all hygienic details were carried out. Careful instructions should be laid down by the architect as to the use of all appliances, and how often, and with what quantity of water every w.c., sink, and drain should be flushed. He did not believe there was any occasion to sterilise the air from wards, except, perhaps, that from small-pox hospitals, and wherever it had been attempted, it had been with but partial success. He supported the views of Mr. Graham as to floor space and the relative distance apart of the beds being the main factors in planning wards; these two points were far more essential than the mere calculation of cubic space. The Local Government Board rules originally laid it down that wards ought to be 24ft. in width and 14ft. in height, but on further consideration the Board considered that a better proportion was 26ft. for width, and not less than 13ft. for height, and the instructions were altered to that extent. As to the cleanliness of hospitals, where possible it was an excellent plan always to allow one ward to remain vacant, and, as it were, fallow; but he admitted the costliness of the system, although it had been adopted in several Continental hospitals.

Dr. Pasteur, lecturer on public health at Middlesex Hospital, thought architects would not go far wrong if they recognised the paramount necessity for surgical cleanliness, the purity of the air, and the non-absorbent character of materials in hospital wards. Every hospital surgeon knew that certain beds in certain wards had a shady reputation; these ought to be traced, for they were due to faulty arrangement or construction. As to terrazzo for flooring, he saw it employed in a country hospital, and thought not only that it had a cold appearance, but it was so hard that it would be dangerous should a delirious patient fall out of bed upon it.

Mr. William Henman, of Birmingham (the architect of the new General Hospital in course of erection in that city), agreed with almost all that Mr. Young had said. The subject of the aspect of wards had been rather overlooked. The axis should run where possible north and south, so that throughout the day one side should have sunshine when it existed. He did not think terrazzo a good material for flooring. It was not only hard should patients fall on it, but trying to nurses, who were constantly on their feet and wore very thin slippers. After a change from cold to warmer weather, such a surface would be dewed over from condensation—obviously an undesirable state of things. He had given much attention to the question of wall surfaces, and had come to the conclusion that it was a grave mistake to employ glazed materials in wards, although they might perhaps be suitable for w.c.'s and operating rooms. Glazed wall surfaces were not only damp but dirty, for to the moisture condensed upon them any dust or amorphous matters in the air would adhere. Concerning the question of ventilation, there had been some controversy since he had read a paper before the Leeds Society of Architects, and some present might have seen a certain pamphlet having a black paper cover enlivened with a red cross on a white shield, brought out by a firm of ventilating engineers. Notwithstanding that little book, he still adhered to the views he had previously expressed as to the efficacy of mechanical ventilation for certain buildings. Birmingham had a dirtier and more fume-laden atmosphere than London, and for a hospital erected in that city something more than mere natural ventilation was, he believed, necessary. Unless the air which came into a building was perfectly pure, it would do patients more harm than good. The methods of mechanical ventilation were being improved. To change the atmosphere of a ward three times an hour, as Mr. Keith Young and also Mr. Graham had advocated, was insufficient, and such changing, if natural means were relied on, was only partially accomplished. In ventilation by mechanical means the air could be renewed ten, twelve, and even fifteen times per hour, without draught. He was now conducting experiments in two specially-built wooden rooms at Birmingham. Each was 14ft. by 20ft. and 10ft. in height. The one was ventilated by natural means, and it was impossible to sit in it for half an hour without discomfort; the other was used as the clerk of works' office, and although the air was changed from eight to ten times per hour, no draught was felt. At the Birmingham hospital he was endeavouring to dispense with unnecessary labour; there would be no fireplaces, no coal or dust-bins, no hot-water pipes, and no crevices for dirt and dust. He expected no difficulties in keeping the air-ducts clean; they varied from 8ft. high by 11ft. wide to 4ft. 6in. high by 4ft. or 5ft. in width. Eight large fans would be employed, capable of actuating a current of 20,000,000 cubic feet of air through the buildings per hour. As this current would be impelled on the Plenum system, no bad smells could arise from w.c.'s or sinks. The air was to be received, filtered through screens, and would pass out through similar screens, and in that way he hoped to eliminate bacteria from the effluent air. There was only negative evidence that the air from fever-wards was not infectious.

Mr. E. A. Fardon, resident medical officer at the Middlesex Hospital, held that, unless it were absolutely impossible to secure a natural system of ventilation, owing to the unfortunate situation of a building, there was no excuse for adopting an artificial method. He had inspected many mechanical systems of ventilation, including those at the Houses of Parliament and the Law Courts, and had never seen one that was approved by those who used it. He thought the importance attaching to uneven temperatures in wards was overrated; the generality of patients were protected by bedclothes, and except for patients suffering from respiratory complaints, no great dangers resulted from variations in temperature. As sites for hospitals were costly where such institutions were most needed, an unnecessary space ought not to be allotted to each patient. With good management and attention to cleanliness, excellent results were secured with only 1,000c.ft. of space per bed. With regard to flooring, terrazzo might be useful in corridors, but was not suitable for ward floors. He had never seen a large area of this material laid down for any length of time that was not fissured owing to expansion and contraction, and this could hardly be obviated with so inflexible a material. The best floor surface was teak, tongued together and beeswaxed. Glazed walls would, as previous speakers had shown, be damp, and would then collect dust and organic matters. Keene's cement, painted and varnished, provided an admirable surface, but it was difficult to keep it polished, and if this were neglected it would deteriorate. A still better plan would be to have a Keene's cement wall painted and varnished up to dado level, and above that to simply distemper the surface.

Mr. Coles was in favour of mechanical ventilation, and urged that with the present facilities for electrically-driven fans, a plenum system was easily carried out.

The Chairman remarked that Mr. Graham had suggested that every architect should design a hospital before undertaking a house. Such an arrangement would be good for the architect, good for his clients who desired houses, and as for the hospital patients, the doctors would look after them, and have many little defects remedied. He then put the vote of thanks, which was heartily accorded.

Mr. Young, in reply, said there were several foreign examples of wards with terrazzo floors, and if these were the best for the patients, nurses must accommodate themselves to the material, and wear thicker slippers, if necessary. At Derby, it was complained that floors of this material were less springy than those of wood. The utmost credit was due to Mr. Henman for the immense pains he was taking to arrive at definite conclusions as to what mechanical ventilation could do for them. He should follow Mr. Henman's experiments with the greatest interest. He approached the subject with a perfectly open mind, and wished to know which method would be best for patients. If it should be proved that present methods were wrong, architects must revise their systems, for they only wished to arrive at the truth. Mr. Henman had spoken of the evidence of the non-spread of fever beyond hospital walls as only negative; but he must have overlooked the positive experience derived from the case of the London Fever Hospital. This building had stood for nearly half a century, and yet the incidence of scarlet fever in the streets around was less than that of Islington parish as a whole, and no case had ever been directly traced to positive infection from the hospital.

COUNTY LUNATIC ASYLUMS.—VII.

By George H. Bibby, F.R.I.B.A.

FEVER WARDS, ETC.

In connection with all large asylums it is necessary to provide for the isolation of those patients who may be suffering with fevers or smallpox, &c. (acquired after or before admission to the institution). In some instances acute febrile diseases of different kinds give rise to an

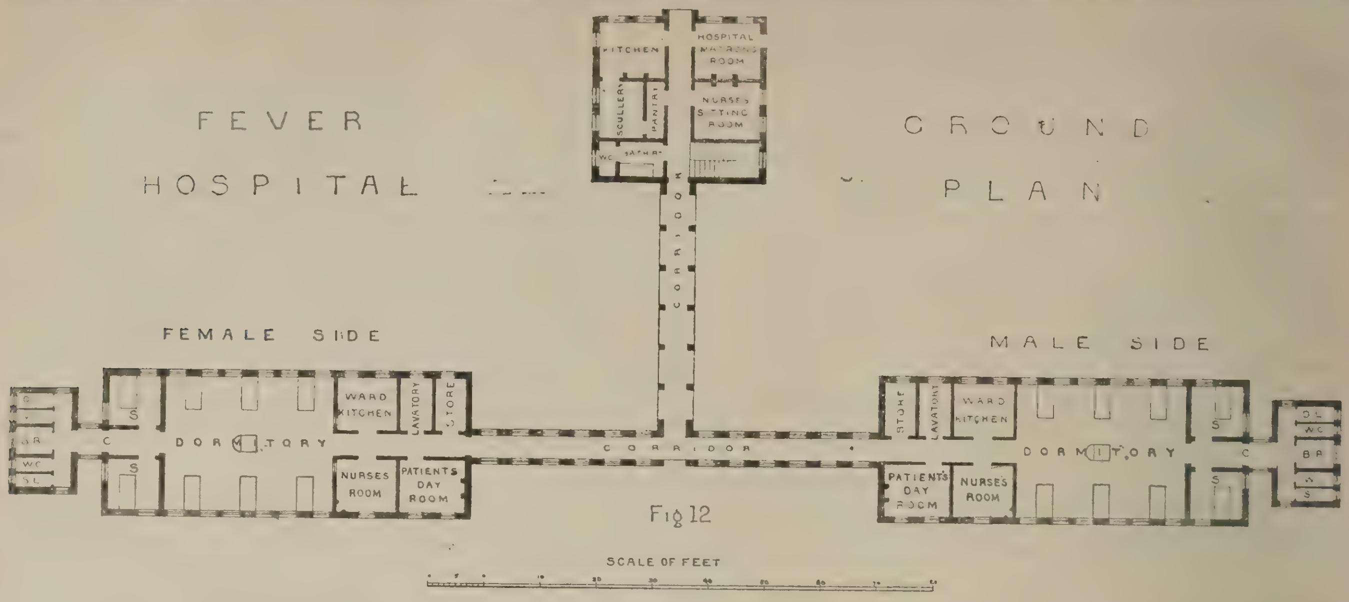

Fig 12

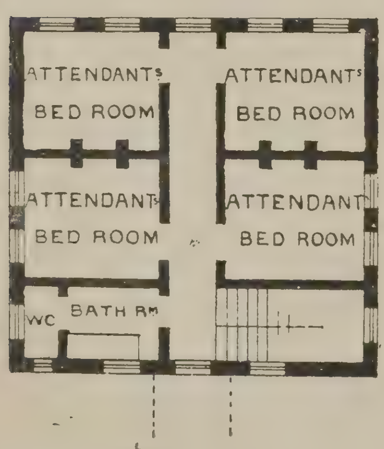
outbreak of insanity. The disorders which they occasion within the organism seem to be the only causes of the insanity, and after a patient is quite free from the fever, or even become convalescent, he often exhibits all kinds of perversities, erroneous ideas on various subjects, and hallucinations, but recovers frequently with improved nutrition and increased strength. But there are also severe cases of insanity which commence during convalescence from fever. There may be two classes of insane fever patients, the one being of those chronic or other lunatics who have the misfortune to be attacked with infectious diseases after admission to an asylum, and the other those persons who may become insane as one result of an outbreak of cholera, smallpox, or fever, &c. Some of these patients become very actively suicidal, and in providing for their accommodation and care, the asylum architect will have to combine, in one building, the requirements of an isolated fever hospital and a miniature asylum, with special opportunities for observation of the patients.

Fig 13



FIRST FLOOR PLAN

For the safety of all concerned, the hospital for insane fever patients must be at a considerable distance from the chief buildings of the asylum, and so placed that the main approaches may be at a safe distance, the building itself being placed in a retired position. The nurses in charge should be housed in a building adjoining the hospital, and should not be under the necessity of intermingling with the officials or patients of the main asylum, and would therefore require to have a small separate administrative arrangement containing all that is requisite for cooking, laundry, and other work, and a disinfecting chamber and fever mortuary are also necessary as adjuncts.

There would be required in connection with an asylum for 1,000 patients a fever hospital for six or eight patients of each sex, in separate wings of the detached building, and there should be at least one or two single rooms on each side, and day or convalescent-rooms for males and females. The area per patient in the dormitories and single bedrooms should never be less than 100ft., or much more if means permit, and the cubical contents should allow from 1,500ft. to 2,000ft. to each inmate. The patients' buildings should not exceed one story in height, and the aspect should be to the southwards.

In Fig. 12 is shown a plan for a fever hospital for 16 patients, eight males and eight females. These are provided for in two wards to contain six patients each. Four single rooms are arranged for those patients requiring special attention, or who, from their mental or bodily condition, may advantageously be separated from others. The male and female wings of the building are each provided with the usual hospital annexe for water-closets, slop-sinks, baths, &c., and each side has also a nurses' room, ward-kitchen, patients' day-rooms, store, and lavatory, the whole arrangement showing a complete separation not only of the wings for each set, but a distinct isolation of the residence for the fever nurses. This residence would be in two floors; but the patients' wards would be only one story in height.

In connection with the fever hospital, there should certainly be a special laundry, containing a receiving-room and a washhouse of moderate size, a closet of drying-horses, and an ironing and finishing-room, together with a disinfecting-chamber, which should be placed near to the receiving-room. The whole of these rooms should be arranged at a fair distance from the fever hospital and residence for the fever nurses, so as neither to create any nuisance to the occupants, or interfere with the free circulation of pure air round the establishment.

Near to the fever laundry should also be provided a mortuary for fever cases, with a juryman's inspecting-window, arranged so that the coroner's officials and the jury may not be brought to any danger during the performance of their duties.

In very large county asylums, perhaps rather more accommodation might be given than that shown upon Fig. 12—two or three additional single rooms, a receiving-room for patients, where they would receive a preliminary examination. Patients are occasionally brought direct to an asylum in a filthy condition—dirt on the skin, matted hair, and with evidences of vermin. And a considerable number of cases of dangerous fever with extreme delirium have been introduced into asylums as cases of insanity; therefore it is most necessary that the medical officers should have every facility for conveniently examining all such patients at the earliest moment after their admission to an asylum.

As a rule, patients should be photographed, weighed, and measured when they arrive, stripped and examined, before being bathed, by the medical officers, their identifying marks, state as to cleanliness, freedom or otherwise from disease or injuries being all then duly noted and entered. They will then be assigned to a suitable ward according to their classification of insanity, unless consigned to the care of the fever nurses, or (as seldom occurs) found to be quite sane.

The desirability of providing accommodation for insane fever patients will be recognised if it be remembered that the friends and relations of the pauper patients visit the asylums in large numbers, bringing occasionally with them, possibly from poor and unclean districts, many opportunities of introducing infectious disease.

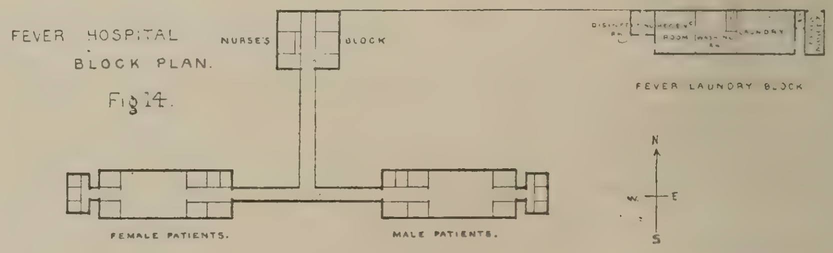


Fig 14.

The condition of most or all county asylums in Great Britain and Ireland has been more or less favourably reported upon by inspecting officials; but some of the lunatic wards in workhouses in Ireland, according to recent reports, appear to be kept in a filthy state and to be badly looked after. In various parts of Ireland architects have been recently called in in various places to deal with the existing want of lavatory, bathing, and other requirements, the absence of which tends so frequently to fill up the wards of fever hospitals.

With regard to the lunatic wards of an Irish workhouse (inspected on the 30th March, 1892), the Government inspector wrote:—"I regret I cannot report favourably of the cleanliness of the patients *or their rooms*, and I found at least one or two beds infested with disgusting vermin. I have no wish to throw any exaggerated blame on the infirmary nurse. It is simply impossible that she can supervise the nursing of a large workhouse hospital, and give at the same time close attention to the infirm and degraded among the lunatics." In another place the same inspector writes:—"All such patients should get a warm

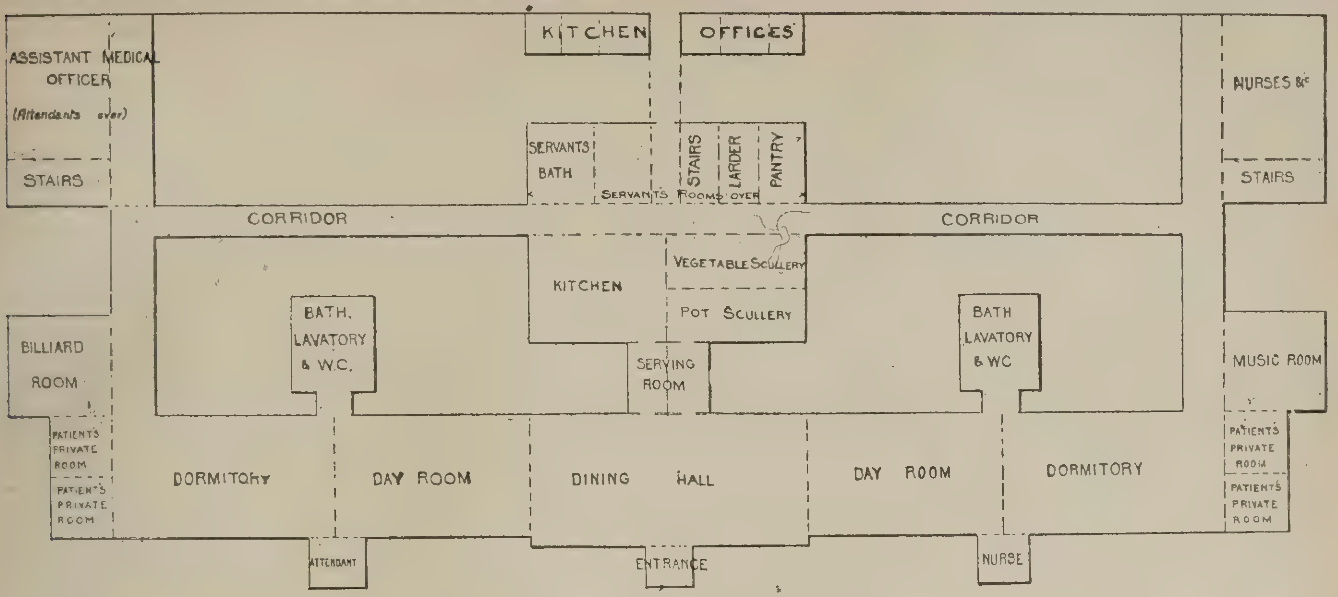

Fig. 15: MALES FEMALES

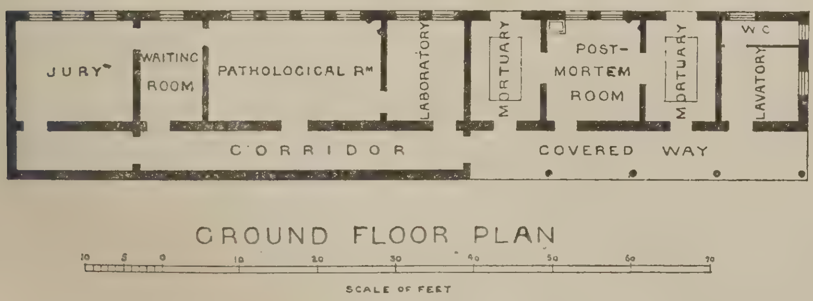
bath at least once a week; but one of the men told me that he had not had a bath during the five years he had been in the house!" I have before me a list of about eight workhouses, the lunatic wards of which have recently been reported upon, being infested with vermin, &c.; but many, or all, of the Irish asylums and workhouses are much overcrowded, and plans for their improvement and enlargement, and for the erection of new asylums, are in active progress, as, indeed, is the case generally in England and Scotland.

Returning to the subject of fever wards for the insane; the materials of which these are to be erected, the precautions to be observed in their construction, and the arrangements for heating and ventilation, would correspond usually with those generally adopted now in cottage or other hospitals of moderate size, and it is obviously due to the nurses of the fever wards that every precaution and care should be taken by the architect to provide all those conveniences and advantages for their well-being that can possibly be contrived, having in view the dangerous duties they may have to perform in the case of insane patients, who not only may be violent and suicidal, but also be suffering from very infectious and loathsome diseases, and requiring the closest and most careful attention both as to their bodily and mental condition.

The apartments requisite for the fever nurses are indicated upon Figs. 12 and 13 (an isolated block of two stories being therein shown). These provide arrangements for a hospital matron, nurses' sitting-room, kitchen, and offices on the ground floor, and bedrooms, &c., on the upper floor. It would be well to provide a small airing-court or inclosed garden for convalescent patients, which might be so arranged as to prevent the escape of patients on the one hand, and the too near approach to the fever hospital of those patients working upon the asylum estate on the other.

FEVER HOSPITAL, MORTUARY

Fig 16.



In many county asylums a certain number of private paying patients are received, and these are occasionally provided for in wards set apart for their use; but sometimes detached buildings (forming almost separate institutions) are provided within the precincts of the main asylum. These may be in the charge of a medical officer acting under the authority and direction of the medical superintendent of the main asylum, from which the stores and supplies would be derived. Occasionally these private patients have been lodged in the mansion purchased with the asylum estate. This has been the case at Claybury, in Essex, where one of the largest asylums in this country has been recently erected. The old hall left on the estate has been altered and arranged for the reception of a considerable number of private patients, and its proximity to so important an asylum will doubtless be of great advantage to the inmates. The apartments of the house are lofty, and the establishment very suitable for the purpose to which it has been converted. The estate is very beautifully situated, being well wooded, upon high ground, and in a very healthful locality.

At Denbigh, extensive additions to the North Wales Asylum are under consideration, and in this case it has been proposed to erect a detached building purposely for private paying patients (within a hundred yards or so of the main asylum). This institution is also placed in a magnificent situation, with charming views on every side of the distant mountains of Wales. It is badly planned in many respects, but the alterations and additions (which I believe are now in hand) will probably tend to bring it up to date.

In planning (in connection with a county lunatic asylum) the buildings to be occupied by paying patients, the accommodation may be upon a more liberal scale, as regards the areas of floor spaces, decorative and other matters, than the portions to be occupied by pauper patients. One or more dining-rooms for males and females, and under some circumstances possibly a few private sitting rooms may be provided; but every precaution must be observed to provide in all cases ample means of observation of the patients by the nurses and officers. Billiard and music-rooms, which should also be provided for in the main asylum, should certainly be provided here; but generally the amount of luxury and comfort supplied would correspond, to a certain extent, with the terms charged per patient, which may vary very considerably, according to the neighbourhood in which the asylum is situated, and whether the paying patients are from the town or country. In the former case the relatives of tradesmen patients may be only able to contribute a few shillings per week, and it is from this class I believe that the paying patients in county asylums are chiefly drawn.

The diagram plan, Fig. 15, exhibits the general arrangement of wards for the private paying patients. A large store-room and other adjuncts are not shown, it being understood that the supplies would be obtained from the general store-house of the main asylum, and that the whole would be under the supervision of its chief medical officer. The building would have the usual airing-courts for males and females, and residences for the servants, nurses, attendants, and medical officer (deputed by the superintending medical officer) having charge of this branch of the asylum work. And here it may be observed that the smaller the asylum the better it is for the patients (as a rule), and the greater their chances of recovery, for there is, of course, more individuality of treatment, and greater opportunities for the study of cases. On the other hand, there are some important advantages connected with large asylums, the equipment being more complete. Many things are here provided for periodical use only, and if small numbers of patients are brought together, many matters cannot be provided on account of their costliness; and in large asylums a greater variety of attendants, nurses, and officials can be afforded.

The mortuary and immediate approaches thereto should be in a building situated well out of the view of all the apartments occupied both by patients and attendants. It should contain two apartments for the bodies of male and female patients, placed on each side of a spacious and well-lighted post-mortem room, fitted with fire-stove, lavatory, and hot and cold water services. In some instances a pathological laboratory and museum are placed in the same building, where are preserved specimens, and where pathological and experimental studies are carried on. But some authorities prefer that the laboratory should not be near to the mortuary (which, if well placed, should be as far from the main asylum as practicable, and is therefore inconveniently situated for the medical officers). It would, upon the whole, be better placed if near to the residences of the assistant medical officers. There should be a skylight inclined to the north, giving ample light; there should be plenty of wall space for shelves, cupboards, and a sink with a hot and cold-water supply. (See Fig. 16).

In the mortuary building there may be added a waiting-room and jury-room, and it would be well to provide inspection-windows in the mortuaries, that the jurymen might be able to view bodies without the necessity of approaching those bodies that may have decomposed, and similar to those necessary in the case of the fever mortuary before mentioned.

Near to the pathological rooms may be an office for the use of the assistant medical officers, in which they would transact the case-book business, and where they would keep the various instruments, &c. (The dispensary is frequently used for these purposes, but is considered unsuitable.) In this office would be fitted, for surgical examinations, a weighing-machine, electric batteries, and various other appliances requisite for the investigation of the mental and bodily condition of patients. The photographic room, however, should be conveniently near to the receiving room, arranged for suitable lighting, and glazed with glass somewhat of a bluish tint.

(*To be continued.*)

THE SOCIETY OF ARCHITECTS.

A MEETING of this Society was held on Tuesday evening at St. James's Hall, Piccadilly, the President, Mr. E. J. Hamilton, occupying the chair. The following five architects were elected as members :—Messrs. J. A. Brand, Craigmillar, Avenue-road, Crouch End, N.; H. E. Clifford, 28, High-street, Watford, Herts; W. A. S. Ely, Bryntirion, Godfrey-road, Newport, Mon.; R. A. Lewcock, 88, Bishopsgate-street Within, E.C.; and R. S. Thomas, Menai Bridge.

The first portion of the meeting was a special one, the object being to confirm (or reject) the following resolution passed at the Annual General Meeting, on October 30th :—

> "That the following Article be added as Article 11A to the Articles of Association, to become operative on October 31st, 1896: 'Subject to confirmation by General Meeting, the Council shall select from time to time certain Examinations, which shall be deemed Qualifying Examinations for Membership of the Society; and Election to Membership shall be only open to Candidates, approved by the Council, who have passed any one of such Examinations, or an Examination held by the Society, with the following exceptions:—(*a*) Candidates who are not less than 35 years of age, and have been directly engaged professionally in architectural pursuits, as Principals, for at least seven years. (*b*) Candidates who are not less than 35 years of age, and have been directly engaged professionally in architectural pursuits, as Assistants, or as Assistants and Principals, for at least ten years."
>
> "That the first list of Qualifying Examinations selected by the Council be submitted to a General Meeting, to be called not later than March 31st, 1895."

The President formally moved the confirmation of this resolution. This was seconded by Mr. Ellis Marsland, and having been supported by Mr. G. A. T. Middleton, was unanimously adopted.

THE LONDON BUILDING ACT, 1894.

Mr. Ellis Marsland, hon. secretary, then read a paper on this subject, which we publish *in extenso* further on. The lecture was illustrated by numerous diagrams, sections, and plans drawn to a bold scale.

Mr. W. R. Mallett, in proposing a vote of thanks to the lecturer for his exhaustive and lucid exposition of the new Act, remarked that on the whole it seemed to be a very fair measure, many objectionable features of the original Bill having been pruned away in Committee. An important feature was the changed view of the Legislature as to what materials were fire-resisting. Iron and stone had disappeared from the schedule, and "oak, teak, and other hard timbers" were now named for the first time in that category. A useful amendment of the law was the legal recognition of the right to put footings on the adjoining owner's land. There was a considerable concession to art manifested; thus the dormers and gables, and bargeboards were no longer prohibited, the 4½in. reveal to windows was not compulsory, and sashes might be brought out flush with the wall, while buildings of historic or antiquarian interest might be restored to their pristine condition even if they infringed the letter of modern laws. He regretted that the Act still refused to recognise hollow-wall construction; the requirement that one of the two hollow walls must be of the full statutory thickness was in effect prohibitory. He should like to know if there were any annotated edition of the Act, and if it was true that the County Council proposed to publish a copy at a cheap rate?

Mr. Henry Lovegrove, district surveyor for South Islington and Shoreditch, in seconding the vote of thanks, pointed out that a change of some importance was that, whereas under the existing Building Acts any question affecting the laying out and width of streets and footways was left in the hands of the County Council; it was under the new Act delegated to the district surveyors, who would therefore need to study the clauses carefully. There seemed to be no power provided to prevent new and wide roads being opened into an old and narrow street. The provisions as to open spaces at the rear of houses were needlessly complicated and difficult, and would probably only be interpreted as cases arose. Of the tribunal of appeal, so far as it had been in operation, he could not speak too highly, and he was glad that its scope was enlarged. It was probable that the member to be appointed by the Home Secretary would be a barrister, and he regretted to hear that both the representative architect and the surveyor on the board—Mr. Arthur Cates and Mr. Driver—were at present in indifferent health. Among the desirable new features of the measure were those relating to artisans' dwellings in blocks set back from streets, and the separation, by thick floors and party-walls, of dwelling rooms from stables; and that underpinning, and thickening of walls in cement were now legally recognised. The new rules as to furnace shafts were also sensible additions to the Building Act. The exemptions of railway structures were not so clear as they should be, nor was the clause as to open sheds sufficiently explicit. As a whole, the Act was a step in the right direction, for it consolidated the law, it provided for the increased stability of buildings, and gave a larger allowance of air space to dwellings.

Mr. W. Allport supported the vote of thanks to Mr. Marsland, and observed that the definition of adjoining owner in the new Act should have been more clear. An omission was that no power was given to the adjoining owner to enter on the building owner's land to ascertain that the footings and underpinning of party-walls were being satisfactorily carried out.

Mr. G. A. T. Middleton thought some reference ought to be made to the work Mr. Marsland did as chairman of a special committee of the Society which sat two years ago to consider a Building Acts Amendment Bill then introduced by the late Government. The Bill was eventually withdrawn, but many of the recommendations suggested by the Society's committee, and to a great extent by their chairman, were closely followed in the present measure, and further amendments had been made in the present Act at the instance of the Council of the Society.

Mr. William Woodward thought the present Act was a great advance on the Bill as draughted. The Tribunal of Appeal was now able to deal with a greater number of disputes. He thought this tribunal would have been strengthened had a representative of the Institute of Builders been added to it. Again, whereas under the Bill the council proposed to acquire land at the expense of the unfortunate owner, it was in the Act agreed to give him compensation. Thirdly, the angle at the rear of the premises was improved, and the ground-floor buildings could now be carried to the rear of the site. They were all greatly indebted to Mr. Marsland for having given them so intelligible and comprehensive an explanation of this complicated Act.

The vote of thanks having been carried by acclamation, Mr. Marsland briefly replied. He believed that several handbooks to the new Act were about to be published, but none had as yet been issued. The County Council had decided to print a copy of the Act with their own by-laws for half-a-crown, whereas the official copy of the Act costs 7s.

THE SURVEYORS' INSTITUTION.

AT the ordinary general meeting of the above Society, held on Monday last at 12, Great George-street, a paper was read by Mr. A. Dudley Clarke (Fellow) on the subject of "The Incidence of Taxation on Land." The discussion on Mr. Clarke's paper, and on a paper somewhat identical in character, to be read at the meeting on December 10th, will be taken at that meeting.

BUILDERS' CLERKS' BENEVOLENT INSTITUTION ELECTION.

A SPECIAL general meeting for the election of one pensioner and one orphan took place at the office of the institution, 21, New Bridge-street, E.C., on Wednesday, Nov. 28th, the President, Mr. Wm. Shepherd, occupying the chair. There were two candidates for the pension —viz., Mrs. S. A. Bennett and Mrs. S. Lovett; and two for the orphan vacancy—viz., Kate C. Hill, aged 9, and Helena M. Smith, aged 3. The poll commenced at 7 p.m., and soon after 8 o'clock, when the poll closed, the result was made known as follows :—For the pension, Mrs. S. A. Bennett 1,108 votes, and Mrs. S. Lovett 537 votes; for the orphan vacancy, Kate C. Hill 880 votes, and Helena M. Smith 494 votes.

The Chairman then announced that the successful candidates were Mrs. S. A. Bennett, who would receive the widows' pension of £20 per annum, and Kate C. Hill, who would be admitted in January next to the Orphan Working School, Maitland Park, per presentation of the Institution.

The scrutineers, Messrs. Ernest S. Rider, Thos. Stirling, jun., and H. W. Parker, were then thanked for their services, followed by a vote of thanks to the President for his kind attendance and occupancy of the chair.

THE LONDON BUILDING ACT, 1894.*

SINCE I last had the honour of addressing you upon London Building Law, the Bill promoted by the London County Council, which was then the subject of my paper, has passed into an Act, and comes into operation on the 1st of January, 1895. This has been done at a vast expenditure of time and money, and the opposition which it encountered in its progress through both Houses of Parliament has shorn it of a great number of its progressive—or, as some would have it, objectionable—features. One hears on all sides a considerable amount of gratification on the part of the various bodies who actively opposed the Bill at the success of their opposition in securing that their particular views were either added to the Act or some objectionable clause struck out; but it appears to me that if all these opposing forces are viewing their endeavours with such mutual satisfaction, we have now either a very perfect measure or a case of too many cooks. This, of course, remains to be seen. We, as a Society, although we did not actively oppose the Bill, have every reason to be satisfied with the result of the suggestions for amendment made to the London County Council, there being scarcely one which has not been incorporated. If we look at the Act simply as one of consolidation, it will be of immense advantage. There is, however, a good deal of fresh matter, and considerable changes will be caused in the carrying out of building operations, both to the builder and architect. The object of my paper this evening is to point out the more important variations from the old law. It will, of course, be impossible, in the limited time at my disposal this evening, to go through the whole of the new Act, so that I must necessarily presume that most of those present have an acquaintance with the present Act, so much of which is incorporated with the new, and it is my intention to point out only the new sections and subsections which will affect us as architects.

The Act is divided into sixteen parts :—Part I., introductory; Part II., formation and widening of streets; Part III., lines of building frontage; Part IV., naming and numbering of streets; Part V., open spaces about buildings, and height of buildings; Part VI., construction of buildings; Part VII., special and temporary buildings and wooden structures; Part VIII., rights of building and adjoining owners; Part IX., dangerous and neglected structures; Part X., dangerous and noxious businesses; Part XI., dwelling-houses on low-lying land; Part XII., sky-signs; Part XIII., superintending architect and district surveyors; Part XIV., by-laws; Part XV., legal proceedings; Part XVI., miscellaneous.

There are four schedules—the 1st dealing with the construction and thickness of walls, the 2nd detailing what are deemed to be fire-resisting materials, the 3rd being a list of fees payable to district surveyors and the council, the 4th containing a list of the repealed Acts.

---

* By Ellis Marsland, Hon. Sec. Society of Architects, and District Surveyor of Camberwell. A paper read before the Society of Architects on Tuesday, Nov. 27, 1894.

In Part I. I would like to draw attention to some of the definitions in Section 5. The number is considerably increased. The expression "new building" means and includes—I., any building erected after the commencement of the Act; II., any building which has been taken down for more than one-half of its cubical extent and re-erected or commenced to be re-erected, wholly or partially, on the same site after the announcement of this Act; III., any space between walls and buildings which is roofed, or commenced to be roofed, after the commencement of this Act. It is important to bear this in mind, as should you desire to cover a space bounded on three sides by old buildings, you will have to ascertain that these walls meet the requirements of the Act and By-laws as to their thickness, foundation, and damp course. An alteration or addition to a building is brought within the operations of the Act by Section 209. The definition of a public building has been amplified, and includes an hotel, lodging-house, home, refuge, or shelter. If the building is of greater capacity than 250,000c.ft., or has sleeping accommodation for more than 100 persons, this latter clause will be somewhat difficult to interpret, as with only 100 beds the corridors, passages and landings, and flights of stairs need be only of wood; but with an additional bed, or with a double bed in place of a single one, the whole character of the building is changed, and what, with 100 beds could be constructed of wood, would with 101 beds have to be constructed of fire-resisting material under Section 68. The district surveyor would have to make a periodical visit to enumerate the sleeping accommodation, which possibly might be a somewhat difficult, not to say delicate task, as under Section 206: "Any building, structure, or work in any respect exempt from the operation of the Act, or in any manner privileged in respect of any provisions of this Act, shall remain so exempt or privileged so long only as it is used for the purpose or retains the character by reason whereof it is so exempt or privileged."

Part II. of the Act, which deals with the formation and widening of streets, and the position of new buildings with reference to streets, is mostly new matter. New roads or streets cannot now be formed, or ways adapted either for carriage traffic or foot traffic, without first applying to the Council, the application to be accompanied by plans and sections, and such other particulars as the Council may require. The Council may refuse to sanction the plans in the case of a new road or street upon the following grounds:—1, where it is not 40ft. wide, if for carriage traffic; 2, where it is not 20ft. wide, if for foot traffic; 3, where it is not open at both ends; 4, where it does not form direct communication between two streets; 5, where it appears that a street proposed for foot traffic only, should be used for carriage traffic as well; 6, where a street has an unsuitable gradient; 7, where a street is not in conformity with the by-laws; and in the case of an adapted road for carriage or foot traffic, upon the following grounds:—1, where houses or forecourts come within 20ft. of the centre, if the way is to be used for carriage traffic; 2, where a road for foot traffic only is not widened to the full width of 20ft.; 3, where such widening would result in the formation of a street not being open at both ends; 4, where such widening would result in the formation of a street not affording direct communication between two streets; 5, where it is proposed to widen a street for foot traffic only, and it appears to the Council that it would be better to widen it for carriage traffic as well; 6, where the widening would result in an unsuitable gradient; 7, where any of the Council's by-laws would be controverted. The Council are bound, however, to answer your application within two months, and if they refuse, must state fully all their reasons for such refusal. The Council also, if they deem it expedient in the public interest, and after notice of their intention to the local authority, may direct that a street, if not within two miles of St. Paul's Cathedral, shall be of a greater width than 40ft. up to 60ft., or a street may be widened more than the prescribed distance from the centre up to 30ft., provided that they pay to the owner compensation for the loss or injury sustained by him by such requirement. The position of new buildings, or the forecourts of new buildings, in old streets being highways, is limited to the prescribed distance from the centre of the roadway except by sanction of the Council; but the prescribed distance may also be increased up to 30ft., provided that the owner is paid compensation for any land given up above 20ft. If, however, an old building abuts upon a street, and the frontage comes within the prescribed distance, and it is desired to rebuild it, correct plans of the old building must be drawn and certified as correct by the district surveyor, and thereupon the site of the old building may be occupied by the new to the same extent, but no more. If, however, this is not done, the new building must be set back. There is one exception, and that is, that no dwelling-house to be inhabited by persons of the working class shall, without the consent of the Council, be erected or re-erected within the prescribed distance to a height exceeding the width of the street, and that no building or structure shall be converted into such dwelling-house within the prescribed distance, so as to exceed such height. This section, however, does not affect the frontage of buildings erected on any private road or way (not being a highway); but it must be borne in mind that if at any time it is desired to convert such a road into a highway, it cannot be done, except all projections within the prescribed distance, and erected after 1878, are set back. It should be noted that some of these restrictions do not apply to the City.

In Part III., dealing with lines of building frontage, the old rule is maintained, that no building or structure is to be erected beyond the general line of buildings in any street without the consent of the Council, such general line of buildings to be deferred by the superintending architect, who is to issue his certificate within one month of the application, and whose decision may be brought before the Tribunal of Appeal. You are not, however, prevented from advancing your frontage line without consent to within 50ft. of the highway if your forecourt in front exceeds this distance; but if by so doing you interfere with your neighbour's light and air, he has his ordinary common-law remedy. The Council, in giving their consent to any projection beyond the line of frontage, have power to attach certain conditions as to giving up land to be left open for the public use, or the particular use to which the projection is to be put, and generally any other condition which they may deem it expedient to impose in the public interest. The superintending architect is also to determine in any doubtful cases in what street any particular building or structure is situate, and which is the front and rear of buildings, but any person feeling aggrieved at his decision may appeal to the Tribunal of Appeal. It is also necessary to bear in mind that the whole of this Part III. of the Act does not apply within the City.

Part IV. of the Act, dealing with the naming and numbering of streets, is not of much interest to architects, and may be passed over.

Parts V. and VI. I propose to group together under three heads, viz.:—Additional open space, light, air, and ventilation about buildings, and other considerations of health. Additional means of safety from fire and panic. Additional structural requirements. The clauses relating to the open spaces about domestic buildings are the most complicated and important of any in the new Act. But if we bear in mind that there are three classes of conditions under which the open space is to be provided, it will help us considerably to a correct understanding of these Sections. Firstly, there is the open space to be provided to a domestic building erected *after the commencement of the Act*, and abutting upon a street formed *after the commencement of the Act—i.e.*, a new site and a new road. Secondly, there is the open space to be provided to domestic buildings erected *after the commencement of the Act*, on sites not hitherto built upon, but abutting upon a street laid out *before the commencement of the Act—i.e.*, a new site and an old road. Thirdly, there is the open space required upon the *sites of old buildings* abutting upon *old streets—i.e*, an old site and an old road. Under each of these three heads we have a preliminary requirement of 100sq.ft. for light and air to any habitable basement, which is to exclusively belong thereto, and be free from any erection thereon above the level of the adjoining pavement, which open space need not necessarily adjoin the rear boundary of the premises. Under the first of these conditions—i.e., a new site and a new road—the following additional open space in rear is required (provided the site is not a corner one or has a road in rear)—viz., 150sq.ft., which is to be provided at the adjoining pavement level and free from any erection, except a w.c. and receptacle for ashes. If, however, the ground story is not constructed or adapted to be inhabited, the open space may be at the level of the ceiling of the ground story, or a level of 16ft. above the level of the adjoining pavement. This is to allow a shop to extend over the whole of the ground story. This open space is to extend throughout the entire width, and to a depth in every part of at least 10ft., so that you see in a 20ft. frontage the minimum space would be 200sq.ft. The height also of the building in rear in relation to the space is to be determined as follows:—A horizontal line is to be drawn at right-angles to the roadway at the pavement level to the rear boundary of the site. At this point a diagonal line is to be drawn at an angle of 63½°, and no part of the building is to extend above the diagonal line, except chimneys, dormers, gables, turrets, or other architectural ornaments, aggregating in all to not more than one-third of the rear elevation of such building. There are other sub-sections dealing with cases where the front line of the site is not level, or where the site inclines towards the roadway, or where the building site is so irregular in shape that a doubt arises as to how the measurement is to be taken. In this latter case application is to be made to the Council, and if the applicant is dissatisfied, he may appeal to the tribunal. Where the land in rear of any such building abuts upon a street or public space, no open space in rear need be provided, and the diagonal line may start from the centre of the roadway, or at the further boundary of the public space. In the case of a building on a corner site abutting upon two streets, or upon a street on one side and a public space 40ft. wide on the other, the Council may permit upon application to them the erection of buildings not exceeding 30ft. high upon such part of the space in the rear as they may think fit, provided that the Council is satisfied that such buildings shall be so placed as not to interfere unduly with the access of light and air to neighbouring buildings. The applicant, however, if dissatisfied with the decision of the Council may appeal to the Tribunal. The return front of a corner site is allowed to be the full height of the front elevation for a distance of 40ft. Any exceptional case, owing to the irregular shape of the land, preventing the provisions of this Section being applied, are to be dealt with by the Council, and if the applicant is dissatisfied he may appeal to the Tribunal. In the case of a domestic building, and a stable in the rear, the front of the domestic building being upon a street, and the front of the stable upon a mews, and the depth of the site not more than 150ft., the stable may be 50ft. deep and 25ft. high, and the open space may be provided between the stable and the house, the diagonal line may start from the centre of the mews. Houses abutting upon the river Thames, or a public park, or on a public space of not less than 80ft. do not come under this Section. Under the second of these conditions, *i.e.*, a new site and an old road, the open space is determined in the same manner as previously explained; but the diagonal line is to start 16ft. above the level of the adjoining pavement, instead of at the level of the same (except in the case of dwelling-houses to be inhabited by persons of the working class). There is, however, an important modification of the rule with reference to buildings not being allowed to extend above the diagonal line. It is this: Any part of any domestic building may extend above the diagonal line, provided the Council shall be satisfied that an open cubic space of air will be provided at the rear equivalent to the open cubic space which section 41 provides; but it is open to this objection, that you cannot adopt it without the sanction of the Council, and if you are dissatisfied with their decision you have to go to the Tribunal. Under the third class of conditions—viz., old site on old roads—it is important to note, before commencing to erect a new domestic building you have to prepare plans showing the extent of the previously-existing domestic building in its several parts, and to submit them to the district surveyor, who is to certify the same under his hand. You may then erect the intended domestic building, but so that no more land shall be occupied by the new building than was occupied by the previously-existing building. If you do not submit plans as I have described, you are to be bound by the provisions herein before mentioned.

If, however, you wish to deviate from such old plans, you must apply to the Council, and if dissatisfied with their decision, go to the Tribunal. I should also like to draw your attention to Section 42, which deals with the open space to be provided to dwelling-houses to be inhabited, or adapted to be inhabited, by persons of the working class, not abutting upon a street. Before you can commence the erection of such buildings you must deposit at the County Hall complete plans of the same; then you have to wait one month. If in the mean time the Council offer no objection to them, you may proceed. If, however, the Council refuse to sanction them, or sanction them subject to certain modifications, you must submit or go to the Tribunal of Appeal. The Council, however, cannot refuse their sanction if the plans show as much open space as would be provided if the buildings abutted upon an old street. Under Section 44, should you desire to rearrange a cleared area previously occupied in whole or in part by buildings, and to form, lay out, or widen streets thereon, you have to apply to the Council and submit your plans, and the Council may, if they, under all the circumstances of the case, think it desirable, modify or relax any of the before-mentioned provisions as to open space. If they disapprove of the plans they must say so within two months, and if they do not you can proceed. If they disapprove, and you are dissatisfied, you can appeal to the Tribunal.

(*To be continued.*)

BISHOPSGATE INSTITUTE.

[WITH PHOTO-LITHOGRAPHIC ILLUSTRATIONS.]

WE illustrate to-day the Bishopsgate façade and plans, together with a view of the buildings and hall from Brushfield-street, of the new Bishopsgate Institute, which the Earl of Rosebery opened last Saturday, the 24th inst. This is one of the three educational and recreative institutes (the others being those of the St. Bride's* and Cripplegate† foundations), which the City of London Parochial Charities Act of 1883 has brought into existence. The charities of the parish of St. Botolph, Bishopsgate (which date from 1481), were, previous to the Act, administered generally for parochial purposes of the usual character. A scheme was, however, prepared by the Charity Commissioners early in 1891, which reorganised the endowments, and from the surplus provided for the establishment and maintenance of an institute "for the purpose of a free library and other purposes" specified in the scheme. The parish trustees, prior to the approval of the scheme, but in anticipation of its establishment, acquired at a cost of £29,000, a site with frontages to Bishopsgate Without, Brushfield-street, and Duke-street, for the erection of the proposed Institute. On the scheme coming into effect the governors of the new foundation invited designs for the building. In the selection of the competing designs the governors were guided by the advice of Mr. J. MacVicar Anderson, then President of the Royal Institute of British Architects; and, finally, those submitted by Mr. C. Harrison Townsend, F.R.I.B.A., of 29, Great George-street, Westminster, were accepted. The treatment of the site was found extremely difficult, owing to the fact that it was surrounded (with the exception of three narrow frontages to streets) by properties claiming rights of light and air. This has prevented the carrying up of the building to any considerable height. The main elevation in Bishopsgate is constructed of buff terracotta, the modelled work being by Mr. W. Aumonier; the fronts to Brushfield and Duke-streets are of red brick with terracotta facings. Over the main entrance are the board-room and clerks' room. The vestibule and a wide corridor give access from Bishopsgate to the large hall, 80ft. by 40ft. wide, and 42ft. high, which, in addition to providing for public lectures and entertainments, is intended on occasion to serve as a picture-gallery. With this latter purpose in view, the lighting has been kept as high as possible, and is mainly by means of a ceiling-light. The hall, which has no gallery, is estimated to seat 528 persons. It has large platform accommodation, at the rear of which are the necessary retiring-rooms, &c. When finished, it will contain a large organ (blown by hydraulic power). The arrangements for exit in case of fire or panic are of a very complete character. The three swing-doors of the hall (each 10ft. wide) open either on to the vestibule (12ft. wide) leading to Bishopsgate, or on to the straight corridor (10ft. wide, and without piers or other projection), by which direct and immediate access is obtained to Brushfield-street. The external doors in all cases open outwards, and are fitted with automatic bolts. Behind the hall is the library block. For convenience of administration, this and the hall block form one building, being connected by means of a wide corridor. When the hall is in use for the purpose of a meeting, the library block will be separated from it by double fireproof iron doors. The library consists of basement, ground and first floors. The bookbinding, repairing, and labelling shops, and a store for surplus volumes, are in the basement, and are all lofty and well-lighted rooms. The ground-floor is occupied by the reference-library and the lending-library. It is believed that all possible quiet has been secured for the reference-library, which has, with this object, been placed in the centre of the building, and farthest from the noise of the traffic in the adjoining thoroughfares. On the first floor (which is reached by a wide staircase of solid teak) is the newspaper and magazine reading-room. The fittings of the reference and lending-libraries are in English oak throughout, and have been supplied (as were all the library fittings) from the architect's designs by Messrs. W. H. Lascelles and Co. Shelving is arranged for 20,000 volumes, but provision for a much larger number can be made from time to time, as the extension of the library requires. The fittings of the reading-room on the first floor are in walnut. Here accommodation has been arranged for about 220 readers. It has not been thought desirable to provide special rooms for either boys or women; but a separate table has been set apart for the exclusive use of the latter. The room of the librarian-director is on the ground floor between the reference and lending-libraries, and by means of the staff stairs immediately adjoining his room he is placed in ready communication with book-stores, lending-library, and reading-room. The issue of books in the reference library will be conducted on the usual lines, but in connection with the lending-library the fittings have been arranged with a view to an experiment on a large and complete scale of a system which has been tried in a partial and tentative manner in some of the public libraries in London and elsewhere. According to this, borrowers are allowed to choose their own books directly for themselves from the shelves, without reference to a catalogue or the intervention of an attendant, except for the purposes of registration. The librarian director, Mr. R. W. Heaton, on whose recommendation the system has been adopted, believes that it will, with the co-operation of the public, be an undoubted success. It is obviously one which will be of great convenience and help to readers, and Mr. Heaton looks to it, more than to anything else, to help in reducing that undue borrowing of works of fiction in preference to other literature, of which librarians in general complain. The two main staircases are of solid teak, and the floors of the hall and library are laid with Goddard's patent oak-block flooring. The walls of the corridors and staircases are lined with enamelled tiles, and the floors of the vestibule, corridors, and landings are of marble mosaic. The floors throughout are fire-proof, and were constructed on Messrs. Homan and Rodgers's system. The building is heated by radiators on the system of Messrs. Ashwell and Nesbit, by which the fresh air is adequately warmed before it enters the rooms. The foul air is carried away by exhaust flues fitted with gas-jets. We hope at an early date to publish an interior view of the great hall which forms the main feature in the entire range of buildings, and makes in every way a worthy addition to the many admirable halls in the city of London. The erection of the building was begun in May, 1893, and since the failure of the original contractor the work has been continued by Messrs. John Mowlem and Co., of Grosvenor Wharf, Millbank, Mr. Thomas Lee acting as clerk of works.

DANGER OF MECHANICAL VENTILATION.

THE second part of "A Danger to Public Health," reprinted from the *Local Government Journal*, resumes the subject of mechanical ventilation, particularly on the down-draught principle by impulsion. A letter on the subject, which appeared in our pages lately, appears on the front page, in which the author pointed out the manner in which this system of ventilation had been "boomed" in America, and had been promoted by syndicates; and why? Because it is an expensive system, and implies a larger commercial profit. Whenever the mechanical system fails, it is easy to say that it is owing to defective apparatus, or that it has been unscientifically applied. We know, of course, the value of such assertions when they proceed from interested parties. The failure of the mechanical ventilation of the Houses of Parliament and the inadequacy of the warming and ventilating arrangement of the New Law Courts are matters which receive attention, both of these being based on the mechanical method by impulsion. Several quotations from sanitary authorities appear, notably the recent report on the failure of the ventilation of the Houses of Parliament, to which we lately referred. An enormous volume of air, equal to ten times the cubic contents of the House of Commons, is passed through it every hour, and notwithstanding this, and the boasted air analysis, the ventilation is very bad. These data cannot be accepted as evidences of good ventilation. Air screens are useful when the air is drawn through by extraction, but when it is forced in under pressure the screens cannot act as they otherwise would. The natural system allows the air to become diffused, whereas the propulsive method blows the air through. A very graphic representation is shown of the manner in which buildings with galleries ventilated with the mechanical downward system, suffer from the contamination of the descending current of fresh air by the products of respiration and combustion from the galleries. Those seated in the area are compelled to inhale the respired air from those in the galleries, as the foul-air exits in the walls at floor level cause the poisoned air to traverse across the faces of the people to those openings. Thus the system stands self-convicted of mischief. This is shown in U.S.A. Government Report to Congress, in which it is condemned *in toto*.

Readers interested in this matter will do well to note Mr. Keith D. Young's remarks in his paper read last Friday before the Architectural Association, together with the remarks of Messrs. Graham, Gordon Smith, Fardon, and others in the subsequent discussion, and reported on another page.

CHIPS.

The Madron local board and urban sanitary authority have appointed Mr. J. Wm. Trounson, F.S I, of Penzance, their surveyor, and given him instructions to forthwith prepare the necessary and required plans for the proposed water supply and sewerage scheme for Heamoor district.

The council of the Society of Engineers have unanimously elected Mr. S. Herbert Cox as one of the vice-presidents, in the place of Mr. Henry Faija, deceased, and Messrs. Henry O'Connor and William Bradford as members of council.

The Oldham Masters and Operative Painters' Association recently waited upon the school board of that borough asking them as far as practicable to let the contracts for painting during the winter months. It had been complained that in other towns where this course was adopted, so as to provide indoor work for the men during the slack season, the cost had been greatly increased; but the Oldham board have decided, as an experiment, to have two schools painted and whitewashed during the Christmas holidays.

Dr. Tsoundas has just finished his excavations in the prehistoric necropolis of the Island of Amorgos. About twenty *tholos* tombs were discovered containing grave goods, consisting of terracotta vases, lance-heads, fictile *figurini*, and one *figurino* in marble of very ancient and pre-Hellenic character.

An examination of master and operative plumbers was held on Saturday at the Borough-road Polytechnic. Candidates were present from London and the district and many provincial towns. Twenty per cent. of the masters and 25 per cent. of the operatives passed the full examination, which included sundry practical tests.

It had been arranged that the inauguration of the new water supply to Colwyn Bay, which is drawn from Cowlyd Lake, above Llanrwst, should be made the object of a public demonstration on Friday, the local committee having asked Mr. Gladstone to perform the ceremony. He, however, declined to do so, and the ceremony stands adjourned. The works have been carried out at an outlay of about £35,000, Mr. Farrington, C.E., borough surveyor of Conway, being the engineer in charge of the scheme, and Mr. Bugbird, Carnarvon, the contractor.

BISHOPSGATE INSTITUTE.

(See descriptive article on page 748.)

HOLBEIN DRAWINGS FROM THE WINDSOR COLLECTION.

Hans Holbein's magnificent iconic drawings in the superb series at Windsor Castle almost alone establish his pre-eminence as a delineator of physiognomy and character, and there can be no doubt that his highest claims to fame really rest upon his unrivalled achievements as a portrait painter. He was, however, of course, employed as a wood engraver and as a glass painter, besides painting large decorative works, and he also designed jewelry and goldsmiths' work, more particularly before he came to England in 1526. It was under the patronage of Sir Thomas More that he was introduced to many distinguished persons, and painted, amongst others, a portrait of Archbishop Warham, besides his patron, Sir Thomas More, the great Chancellor. Subsequently he became engaged permanently in the service of Henry VIII., and by painting the likeness of Anne of Cleves is said to have largely assisted the decision of the king when that worthy ventured upon a fourth inauspicious marriage. The big picture of King Henry and the Court of the Barber Surgeons' Company receiving the Charter of its reconstitution was commenced about 1541, and still hangs in the Court-room of that Livery in Monkwell-street, E.C. "The Ambassadors," now in the National Gallery, is another of Holbein's chief works; it was painted in the year 1533. His exquisite drawings at Windsor, and those collected at Basle, with a few similar studies scattered elsewhere, afford the best idea of Holbein's masterly insight and ease of draughtsmanship, marked as it is by force united with delicacy, at once free from all trace of mannerism or crudity of conception. We are enabled to reproduce to-day two of these transcendent drawings from the beautiful series of photographs, which Mr. Fredk. Hollyer, of Pembroke-square, has taken direct from the originals, by permission of the Queen. The first of these is the portrait of John More, son of the Chancellor, and the other is a portrait of Archbishop Warham of Canterbury.

PRIVATE BOARDING SCHOOL, WEST FOLKESTONE.

Built for Mr. Edmund Stow Thompson's first-class boys' school, these new buildings occupy one of the best sites in Folkestone, the sand cliff behind sheltering them from the north and north-east winds, while their height above the sea gives a very fine range of view over Sandgate Bay. They include a school-house for about forty-five boarders, with lofty school and class-rooms, assistant masters' and matron's quarters, the boys' dormitories being partly fitted with cubicles and partly for open beds. The principal's private house occupies the west block, which has direct communication with the schoolhouse on three floors. With the exception of the matron's sitting-room, every dwelling-room in both blocks has a sunny aspect. Severely plain as the building is, it is substantial. Great care has been devoted to the ventilation and sanitary system in all its branches. The half-timbering is in deal left from the saw, and treated with carbolineum prepared by Messrs. Peters, Bartch, and Co. The cost has been at the rate of 6¼d. per foot cube, including all permanent fittings, and has been carried out by Messrs. Hayward and Paramor, of Folkestone, under the direction of Mr. W. Howard Seth-Smith, F.R.I.B.A., of London, Mr. Walter Mitchell acting as clerk of works.

HOUSE AT HOOK HEATH.

This house, near Woking, Surrey, stands on high ground overlooking the valley behind Guildford. It is finished externally with rough-cast and tile hanging, the builder being Mr. Kimberley, of Banbury. The architect is Mr. Horace Field, of 246, Regent-street, W. The drawing was in this year's Royal Academy.

THE MALLYON SPOUT HOTEL.

This is a quiet and homely little house, and is built near the picturesque moorland village of Southland, for the accommodation of tourists and sportsmen. The walls are of local stone, with metal casements, leaded glazing, and red-tile roofs. Mr. Barnes, of Malton, did the mason's work, and Mr. Yearsley, of Pickering, the joiner's work. Messrs. Demaine and Brierley are the architects.

TOUR DE L'HORLOGE, DINAN.

The Tour de l'Horloge, one of the most picturesque bits in an exceedingly interesting old town, stands nearly in the centre of Dinan, not very far from the church of St. Sauveur. It dates from the 15th century, and was at one time the place of meeting of the municipality. The view from the gallery is very fine and extensive. The clock, which for nearly four hundred years has told the march of time from this tower, was a present from the Queen-Duchess, Anne of Brittany, to the town of Dinan in 1507. Engraved on the bell is the following inscription:—

> "Anne, pour vray je fus noumée
> En l'an mil cinq cent sept,
> Des nobles de la ville noumée
> Tierce de ce pays en effet.
> Je fus en celui au fondue
> Au mois d'aoust par Phlipes Bufet.
> Et de bon mestal bien randue
> Du poys de six mille et sept."

JOHN KNOX PRESBYTERIAN CHURCH, NEWCASTLE-ON-TYNE.

The new Presbyterian Church for the accommodation of the congregation lately worshipping in the old church in Clayton-street is being erected on a fine site on the Beech Grove Estate, at the corner of Elswick-road and Beech Grove-road. The church is arranged on a novel principle never previously introduced in this district, the plan being of a horseshoe shape, the congregation entering through a covered porch, then through a large inclosed vestibule into a corridor leading right and left round the curved end and the sides of the church. From this corridor there are six doors leading to the aisles communicating direct with the seating. Above the surrounding corridor, and projecting a very little way over the ground-floor seating, is placed the gallery, thus producing a galleried church with none of its defects, and concentrating the congregation around and near the pulpit. This also obviates the necessity of anyone sitting in a twisted position, as each person directly faces the minister, the floors also sloping gently towards the pulpit. The staircases to the gallery go right and left from the main entrance vestibule, and ladies' and gentlemen's cloak-rooms are also provided at each side of the vestibule. Behind the pulpit is a large recess for the organ, with a similar recess at the opposite end, thus breaking the monotony of the square of the church, which is roofed in one span of 58ft. In convenient proximity are arranged the minister's vestry, sessions vestry, large assembly hall, 58ft. by 39ft., with gallery at one end, and six class-rooms, divided by movable partitions. On the upper floor there is a second hall, 38ft. by 17ft., and on the ground floor a third one, 28ft. by 17ft., a library, ladies' sewing-room, tea-kitchen; and underneath the large hall, owing to the steep fall of the ground, there is planned a large gymnasium. A caretaker's house is also provided. A separate entrance is arranged to all these rooms from Elswick-road and Beech-grove, with interior communication throughout. In a plan of this nature it is almost impossible to adopt the Gothic style, and the building has, therefore, been designed in Classic, somewhat of the Doric order. A square tower rises at the main corner next Elswick-road to a height of 70ft. The entrance portico is treated with columns and balustrade over, and the side next Elswick-road is spaced out with pilasters, architraved and pedimented windows, heavy cornice and balustrade over. The building is constructed of stone from the Prudham quarries, the filling-in being with self-faced blockers, and the facing polished ashlar. The interior will be finished in plaster, with pilasters, cornices, and coved ceiling; the woodwork will be yellow pine stained to a brown oak colour, and wax-polished. The heating and ventilation are receiving special attention. Fresh air is admitted underneath the church through a hemp screen, to clear it of impurities, with a jet of water playing on the screen to keep it damp and cool. It is then passed over hot-water pipes underneath the building, and admitted to the church through each seat-end on the ground floor; the vestibule and surrounding corridor being also warmed by hot-water pipes, so that any inlet of air from this to the church will be warmed, and free from draught. The several cloak-rooms, vestibules, and hall are similarly warmed by the circulation of hot water on the low-pressure system, from boilers in heating-chamber in basement. The air is extracted from the higher part of church by means of an extract-fan, placed in the upper part of tower. It is intended to illuminate the church by the electric light. The amount of the contract for the several buildings is about £8,000. The portion of the work already executed, comprising the halls, class-rooms, vestries, &c., has been carried out by Mr. G. H. Mauchlen, contractor, Newcastle, and the church, cloak-rooms, and tower are now being built by Mr. Alex. Pringle, contractor, Gateshead. The duties of clerk of works have been undertaken by Mr. Nicholson, and the whole building has been designed by Mr. W. Lister Newcombe, F.R.I.B.A., of Newcastle-on-Tyne.

CHIPS.

The new schools at Nantymoel are being warmed and ventilated by means of Shorland's patent Manchester grates, stoves, and patent exhaust roof ventilators, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

At a meeting of the Easington Union Rural Sanitary Authority, held on Monday, Mr. D. Balfour, M.Inst.C.E., F.G.S., Newcastle-on-Tyne, was instructed to prepare plans for schemes of water supply for villages of Castle Eden and Wingate.

St. Anne's Church, Aigburth, which has been closed for a considerable period for the purpose of extensive restoration, was reopened on Saturday. The church was built in 1836 at a cost of £4,328. The galleries and pews have been removed, the church refloored, a new baptistery erected, a central entrance constructed, the organ removed from the end gallery to the south transept, a large choir vestry erected, stained-glass windows provided, &c. These improvements have been effected at a cost of over £2,000. Mr. Charles E. Deacon, of Liverpool, was the architect.

New casual wards are now being erected at Poplar Workhouse, and special consideration has been given to the ventilation, which will be carried out on the Boyle system, the latest patented improved form of the self-acting air-pump ventilators being adopted for the extraction of the vitiated air.

The sanction of the High Court has been obtained to the promotion of a Bill, next session, with reference to the Liberator Building Society's buildings, now in course of completion, between the Strand and the Thames Embankment. Under the powers to be inserted in the Bill, Parliament will be asked to authorise a widening of that portion of the Strand facing the Embankment-buildings between Ivy Bridge-lane and Carting-lane. The scheme will include the widening of Carting-lane from the Strand to the rear of the Savoy Theatre, and also the entire discontinuance for public use of Salisbury-street and Cecil-street. The cost of these improvements, and the cost of passing this Bill through Parliament will be borne by the liquidator to the Liberator Building Society and J. W. Hobbs and Co., Limited.

JOHN KNOX PRESBYTERIAN CHURCH NEWCASTLE-UPON-TYNE - W. LISTER NEWCOMBE FRIBA ARCHITECT

WAYSIDE NOTES.

Several structural alterations are just now in progress at the House of Commons. A few are for the accommodation and convenience of pressmen, whose writing and smoking rooms have long been defective. But the majority of the changes are below stairs in places set apart for the use of legislators. One part of the scheme is to provide an additional dining-room, as well as to enlarge the kitchens; but, in addition to these extensions, there has to be a new smoking lounge for members, a series of hot and cold baths for variable weather, and a couple of apartments in which ordinary attire may give place to evening dress. The effect of the renovations will be to increase the claim of Westminster to be called "the best club in London." With that object in view, it can hardly be said that £14,000 is a high price to may for such a distinction. But what a struggle there will be for the right of entry when members are paid for going there, and when no preliminary expense need deter the humblest amongst us from seeking admission!

The public works of New Zealand are now conducted on the co-operative principle. When a railway or highway of any kind is to be constructed, a Government engineer makes a survey and an estimate of the cost. Upon the basis of this estimate the work is given in small sections to gangs of men, who each receive an equal proportion of the money earned. There is no calling for public tenders, thus dispensing with the contractor altogether, whose profits, if any, are distributed among the men. The Government supplies tools and necessary material, if the men are unable to do so, charging first cost only for whatever is supplied in this way. The work is conducted under the nominal direction of the Government engineer, whose duty is to give measurements and levels, and generally to see that the work is properly done. The men, I hear, work very hard, and earn good wages. They pocket the profits that go to the contractor under the old system, and the Government, it is alleged, gets the work done at no greater cost than formerly. I should like to hear from some New Zealand reader whether it is true that the co-operative system has given great satisfaction, and has to a large extent solved the problem of the unemployed in New Zealand.

With reference to the question of Sunday opening of museums, the action of the Trustees of the Soane Museum in Lincoln's Inn, in deciding to open that institution next Sunday afternoon is not without significance, and it may be looked upon in the light of a tentative measure. I hear that Sir B. W. Richardson, who is one of the trustees, undertook to be on duty at the museum for the occasion; and it remains to be seen to what extent the public will take advantage of the opportunity to view the house and collections of Sir John Soane. Among the contents are the celebrated series of Hogarth's pictures of "The Rake's Progress," while the library contains the first three folio editions of Shakespeare and an original MS. of Tasso's "Gerusalemme Liberata." The majority of the exhibits are too well-known to most readers of this journal to need recapitulation; but there are probably some who have never been inside the doors, and may care to pay the museum a visit on Sunday.

Small holdings are making slow but satisfactory progress in the county of London. Frequent applications now come in, and a new site has just been selected, 10½ acres in extent, at Perry Rise, Catford, which will shortly be laid out in plots. It is anticipated that the rents received from the tenants will cover the whole of the outlay to which the London County Council will be put in securing the lands under the Small Holdings Act of 1892, and in rendering it suitable for the purpose for which it is to be used. The progress of the experiment will be watched with interest, for the Metropolis is scarcely the place which might have been thought best suited for its trial, owing to the abnormal value of land within the London area. The Council appears satisfied, however, after the full investigation demanded by the Act of 1892, that small holdings are both desired and desirable in the capital; and time will show how far this estimate is correct.

The City Commissioners of Sewers, in their capacity of the Burial Board for the City, came to a resolution some time ago to erect a crematorium at their cemetery at Ilford. They have rescinded that resolution, as they have discovered that it cannot be carried into effect without a private Act of Parliament, which would entail an expenditure of £400 or £500 if the Bill were unopposed, but otherwise might cost as many thousands. It does not appear that there is any change in the ideas of the commissioners as to the sanitary importance of cremation. But it is an illustration of the extent to which a reform of Parliamentary procedure is necessary when a public body cannot erect a crematorium without being compelled to squander money freely on the elaborate machinery of highly-paid Parliamentary barristers. Why, in the midst of all our legislation about local government, and our cry about the necessity of devolution, should not the City Corporation be able to erect a City crematorium? The City is much more advanced in many matters than many of its loud-mouthed detractors.

Lieutenant-Colonel Ford has give notice of motion, "That it be referred to the General Purposes Committee of the L. C. C. to consider and report on the feasibility and desirableness of securing a supply of sea-water for London." In point of fact, a measure embodying a similar scheme was brought before Parliament and actually passed in the House of Commons some fourteen years ago; but, on account of the cost involved, the project came to nothing. The contention now is that of the existing water supply vast quantities are thrown away for cleansing sewers, keeping the streets in good condition, and other such purposes, only an infinitesimal amount, in proportion, being utilised for consumption, and there is a growing feeling that the time will come when the supply will altogether fall short of the demand. The details of the scheme have not yet transpired; but it has been suggested that salt-water could be pumped into a reservoir some twenty miles distant from London, where land is cheap, and thence brought to the City. The supply thus procured, could be furnished to the various district authorities at very cheap rates and used for many purposes.

A considerable clearance of ground has been taking place around Guildhall. On the Basinghall-street side the old "Chamber of London" is removed to make room for the better accommodation of the Commissioners of Sewers and their staff; and, in Aldermanbury several old houses that have been occupied successively by the Guildhall School of Music and by the Town Clerk's and City Architect's Departments are nearly cleared away, leaving open a large site the particular utilisation of which has not yet been decided on. Perhaps the City authorities mean to leave it vacant for the benefit of the coming new Corporation? I should prefer to see it dealt with by the old one. Whatever else may be said against it, the City of London is far and away ahead of the London County Council in the business-like character of all its architectural and sanitary undertakings.

There are few things pleasanter than a good band of music in a pretty park, and the members of the London County Council are well employed when they give attention to the subject. But the London correspondent of the *Newcastle Daily Chronicle* sensibly enough remarks, that the members of that august body should not make themselves ridiculous. They want £8,500 for bands next year, and they propose that the men should play in diminutive gardens as well as in spacious parks. To a certain extent this is also a commendable move, especially when the selected site is big enough for the purpose. They should be careful, however, not to waste public funds over absurdities. For nearly a year one of the gardens on the Thames Embankment has been partially closed to visitors, owing to the fact that a very ornate music platform was in course of erection. At a moderate computation, the structure now occupies one-sixth of the whole inclosure—the other remaining to be trampled down when the performances begin. Yet for this injury to a "Metropolitan oasis" the ratepayers have had to spend several hundreds of pounds—presumably for the delectation of the members of the London School Board, for no one else will ever be able to listen to the music with any comfort.

OBITUARY.

Mr. Septimus Oswald, architect, of Newcastle-on-Tyne, died at his residence, Brightside, Granville-road, Jesmond, on Monday, aged 71 years. He was widely known and highly esteemed in the district. He was a native of Gateshead, served his time with Mr. Andrew Oliver, architect, Collingwood-street, and afterwards he was in the employment of Mr. Henry Welsh, surveyor for the county. Mr. Oswald subsequently commenced business for himself, having his offices first in Mosley-street, then in St. Nicholas Buildings, and afterwards again in Mosley-street. His only son, the president of the Northern Architectural Association, and a member of the Council of the Royal Institute of British Architects, became a partner, and of late has in a great measure carried on the business himself. For the last twelve months the deceased had been unwell, and for some time had been unable to leave his house.

Mr. Henry Roe, formerly the head of a well-known firm of Dublin distillers, died in London on Wednesday in last week, aged 68 years. Impressed by the example of the late Sir Benjamin Lee Guinness, the father of Lords Ardilaun and Iveagh, who restored St. Patrick's Cathedral, Dublin, at a cost of £150,000, he conceived the idea of rescuing the sister cathedral of Christ Church from the decay into which it was falling, and placed the work in the hands of the late G. E. Street, who had a free hand to execute it in accordance with his own views. The cathedral was reopened in 1878. Mr. Roe also commissioned Mr. Street to design a synod house for the clergy in architectural harmony with the cathedral. These undertakings involved an outlay estimated at £200,000, and, a turn in the tide of prosperity having taken place, they were a source of considerable embarrassment to the donor.

CHIPS.

A new Presbyterian church is about to be erected in Ballard's-lane, Finchley. Messrs. Holloway Brothers are the builders.

In the case of George Sear, of Watford, builder, the discharge from bankruptcy has been suspended for six months, ending April 22, 1895.

The local board of Middlewick have adopted a scheme of water supply prepared by Mr. Worth, their surveyor, having received a favourable report upon it from Mr. Alfred M. Fowler, M.Inst.C.E., of Manchester.

Mr. Alfred Templeton Hawkins again appeared at the Guildhall on Tuesday, to answer the charge of stealing sums belonging to the National Dwellings Society (Limited), of which he was a director. A good deal of further evidence was taken, and another remand granted, the prisoner's bail being reduced.

A colossal marble statue of the late Oliver Heywood, to be erected in Albert-square, Manchester, has just been completed by Mr. A. Bruce Joy, and will shortly be unveiled. Mr. Bruce has also in hand and nearly finished a memorial of Sir Robert Montgomery for St. Paul's Cathedral, and a statue in marble of the late Edward Whitley, M.P., to be erected in St. George's Hall, Liverpool.

A receiving order has been granted in the case of William Stubbs, of Phœnix Wharf, Commercial-road, S.E., contractor.

Mr. R. Walton, C.E., one of the Local Government Board inspectors, held an inquiry in the Town-hall, Rhyl, on Tuesday, respecting an application by the Rhyl improvement commissioners to borrow an additional loan of £9,286 for completing the sewerage works now being carried on at Rhyl under the direction of Mr. Balwin Latham, C.E.

The Methodists of Hucknall Torkard, Notts, are about to erect a large chapel and set of Sunday schools at the junction of Beardall-street and Watnall-road. Mr. Henry Harper, Market-place, Nottingham, has been appointed architect.

A new hall and Sunday schools, which have been added to Wycliffe Chapel, Langsett-road, Sheffield, were opened on Monday. The buildings have cost £4,000, and have been erected from designs by Mr. C. J. Innocent, of George-street, Sheffield. Mr. Joel Midwood, of Harold-street, Walkley, was the sole contractor.

The Corporation of Newcastle-under-Lyme acquired the local gasworks fourteen years ago, and have carried out extensive works of reconstruction at a cost of £12,000, from plans prepared by Mr. W. Winstanley, the manager and secretary, and under his supervision. Mr. J. Gallimore has built a new meter-house and boiler-house block, and converted the No. 1 gas-holder into a tar and liquor store; Mr. S. Wilton, jun., being the contractor for the new retort-house and coal-store.

NOTES ON BUILDING PRICES.

By John Leaning.

(*Continued from p. 535. Vol. LXV.*)

JOINER.

THE broad distinction between carpentry and joinery is that the former is generally framed and prepared at the building, while joinery is prepared at the contractor's workshops and brought to the building ready for fitting and fixing. Its cost would, therefore, properly involve a larger percentage for establishment charges than other portions of the building; but this, save in exceptional circumstances, it is not the custom to consider, one uniform rate being applied to all the items of an estimate, as recommended in an early paper of this series.

The material for carpentry, as before remarked, is often of very common quality, possibly because it is nearly all concealed; but the wood used for joinery must be fairly good, as it receives a higher finish, is constantly in view, and its defects more easily judged. Moreover, the warping and cracking of material of poor quality and without seasoning would be at once apparent. It need hardly be said that the architect who defers his examination of the joinery of a building until its delivery on the work puts himself at a disadvantage. The artistic stopping and priming sometimes done before it leaves the workshops make it very difficult to discover defects.

In the production of joinery the builder derives more help from machinery than in any other branch of his trade. Sawing, planing, mortising, tenoning, when there is sufficient work to justify the use of machinery, are all done by its means. The mouldings are "stuck" by the moulding-machine, while the profiles of shaped pieces of wood are cut by the band-saw with great speed and accuracy.

When the builder has not a sufficient business to justify the extensive use of machinery, he contents himself with a circular saw and a general joiner, or some such machine, and obtains long lengths of mouldings, door-frames, beads, grounds, parts of sashes and sash-frames, &c., from a moulding mill, which would, on directions given, supply both labour and material for items of this kind.

There are several firms in London and its vicinity who make sub-contracts with the original contractor for the whole of the joinery of a building, most of whom produce work of very good quality, and often at a less price than it could be done in the contractor's own shop.

The preliminaries to the valuation of joinery must be a list of constants of labour and a table of cost of deal in thicknesses, similar to that given in the trade of carpenter.

Much of the wood used for joinery is brought into the market machine-planed, and only requires smoothing; while for the commoner parts of joinery work, prepared floorings can often be conveniently used at a saving of cost.

Properly seasoned wood is often difficult to get, and always commands a high price, consequently those building firms who have the reputation for good joinery keep a large stock of deals and battens in stock, so as to insure well-seasoned wood for their work; and when wood is well-seasoned, it is worth more by the interest on the outlay for the time it has been kept.

The preamble of a bill of good work will stipulate that the deals for joinery shall be the best St. Petersburg or Onega yellow. The panels the best bright St. John's or Quebec pine. The St. Petersburg best would be marked with a crown over the word "Gromoff," the name of the shipper; or "C. and Co.," for Clarke and Co.; or a crown between the letters "P. and B.," the mark of the shippers, A. P. Belaieff; or "P. B. S. and Co.," the mark of the shippers, Peter Balaieff's Successors and Co. The best St. Petersburg deals generally cost, at the dock sales, about £13 per St. Petersburg standard.

The pine would be yellow. The best is known as 1st bright pine deals. Gilmour or Booth are shippers of the best; they commonly cost, at the dock sales, about £20 per St. Petersburg standard. The use of pine for panels is almost universal, as its width enables the tradesman to dispense with a glued joint, which, if deals were used, would generally be necessary. Its fine grain and facile working render it most convenient for mouldings, for which it is much used by the moulding makers. For panels of work circular on plan, "Basswood" (American lime) is most useful, and produces good work. It need hardly be said that a great quantity of deal and pine is sold at the dock sales at much below the above prices, and that it is all converted into joinery for some destination. Nothing but mature experience and naturally good judgment will enable the estimator to assess the price of the material.

The above price will, however, be adopted for the following calculations, and the total price for deal will consequently be as follows:—

	£	s.	d.
Joiners' deals at docks per St. Petersburg standard	13	0	0
Landing rates		3	9
Unloading		1	6
Cartage by sawmill proprietors as before.			
Two years' compound interest at five per cent. per annum on the total of the first three items, £13 5s. 3d., two years being assumed as the time required for thorough seasoning	1	7	3
Waste in sawing and conversion, ten per cent. on £14 12s. 6d.	1	9	3
Cost per standard	16	1	9

In ordinary framed work, as doors and partitions, the cost of the pine used would but slightly exceed that of good joiner's deals, and the difference has been disregarded.

Analysis of cost of a St. Peterburg standard of rough deal sawn to various thicknesses:—

Assumed to contain 74 times 12ft. × 9in. × 3in., = 666super.ft. of 3in., equal 166ft. 6in. cube, a little in excess of the actual quantity (165ft. 0in. cube).

	£	s.	d.	
¼in. = 11 cuts in 3in. × 9in. (producing 12 thicknesses of ¼in.) = 814 cuts = 67⅚ doz. at 2s. 3d.	16	1	9	deal
	7	12	7½	sawing
7,992ft.)	23	14	4½	
			¾d. per ft.	
½in. = 5 cuts in 3in. × 9in. (producing 6 thicknesses of ½in.) = 370 cuts = 30⅚ doz. at 2s. 3d.	16	1	9	deal
	3	9	4½	sawing
3,996ft.)	19	11	1½	
			1¼d. per ft.	
¾in. = 3 cuts in 3in. × 9in. (producing 4 thicknesses of ¾in.) = 222 cuts = 18½ doz. at 2s. 3d.	16	1	9	deal
	2	1	7½	sawing
2,664ft.)	18	3	4½	
			1⅝d. per ft.	
1in. = 2 cuts in 3in. × 9in. (producing 3 thicknesses of 1in.) = 148 cuts = 12⅓ doz. at 2s. 3d.	16	1	9	deal
	1	7	9	sawing
1,998ft.)	17	9	6	
			2⅛d. per ft.	
1¼in. = 2 cuts in 3in. × 9in. (producing 2 thicknesses of 1¼in. and 1 of ½in.) = 12⅓ doz. at 2s. 3d.	13	8	1½	deal
	1	0	9¾	sawing
1,332ft.)	14	8	11¼	
			2⅝d. per ft.	

Note.—One quarter of the total of the sawing last mentioned is allotted to the ½in., leaving three-quarters (the remainder) for the calculation. The deal is reduced by one-sixth.

	£	s.	d.	
1½in. = 1 cut in 3in. × 9in. (producing 2 thicknesses of 1½in.) = 74 cuts = 6⅙ doz. at 3s. 9d.	16	1	9	deal
	1	3	1½	sawing
1,332ft.)	17	4	10½	
			3⅛d. per ft.	
1¾in. = 1 cut in 3in. × 9in. (producing 1 thickness of 1¾in. and 1 thickness of 1¼in.) 74 cuts = 6⅙ doz. at 3s. 9d.	9	7	8¼	deal
	0	11	6¾	sawing
666ft.)	9	19	3	
			3⅝d. per ft.	

Note.—One half of the total of the sawing last mentioned is allotted to the 1¼in., and the deal reduced by $\frac{5}{12}$ths.

	£	s.	d.	
2in. = 1 cut in 3in. × 9in. (producing 1 thickness of 2in. and 1 of 1in.) 74 cuts = 6⅙ doz. at 3s. 9d.	10	14	6	deal
	0	11	6¾	sawing
666ft.)	11	6	0¾	
			4⅛d. per ft.	

Note.—One half of the total of the sawing last mentioned is allotted to the 1in., and the deal reduced by ⅓rd.

			5¾d. per ft.	

Some estimators, in addition to the table of value of rough deal, prepare a table of the various thicknesses with ordinary labours upon them like the following, adopting the prices of deal in the last table given. Such a table is found in the majority of good schedules of prices, and is not only easily applied, but is a good means of comparison with prices otherwise calculated.

COST OF DEAL IN THICKNESSES, BASED ON THE PRICES BEFORE CALCULATED.

	s.	d.
½in. rough deal, exclusive of fixing	0	1¼
Do. do. including rails and fixing	0	2
Do. do. edges shot	0	2½
Do. do. wrought one side and one edge	0	3¼
Do. do. wrought two sides and two edges	0	4
Do. do. wrought one side, and framed, clamped, and dovetailed	0	6
Do. do. wrought both sides	0	6¾
Add to either if ploughed and tongued	0	0¾
Do. do. if cross-tongued	0	1

Complete the table by using the various thicknesses, as ¾in., 1in., 1¼in., &c.

A table of fillets at the same rate for deal (£16 1s. 9d. per standard) will also be necessary. The principle of its construction will be the same as before described in the section Carpenter, and the result as follows:—

FILLETS.

	½in.	¾in.	1in.	1¼in.	1½in.	2in.
2in. wide and under per foot run, rough	¼d.	¼d.	¼d.	⅜d.	⅜d.	½d.
Ditto, wrought	½	½	½	¾	¾	1
2¼in. to 3in. wide	⅜	½	½	⅝	¾	1
Ditto wrought	¾	1	1	1	1½	1½
Add if fixed with screws	¼	¼	¼	½	½	½

The smallness of difference in value between rough and wrought makes any nicety of distinction in their valuation impossible and unnecessary.

The following difference between straight and circular fillets is adopted in ordinary schedules:—

Add to fillets, "if bent circular, one-fourth the foregoing rates"; "if cut circular on both edges, once the foregoing rates"; "if cut circular on one edge, half the foregoing rates."

A SPECIFICATION ANNOTATED.—III.

16. *Detail Drawings.*—The architect shall at all times, as he may himself think fit, or on the builder's requisition, furnish such additional plans, details, and descriptions as may be necessary for the proper execution of the work. Provided always that the builder shall not be required to carry out such plans if they involve an expenditure on labour or material not provided for by this contract in the original estimate, or in any accepted supplementary estimate for additional or "extra" work.

The architect will find it necessary to furnish the builder with large-scale or full-sized details of various parts of the work from time to time as the work progresses: it is clearly right, and to the advantage of all parties, that he should do so. But as a matter of common honesty, it is absolutely necessary that such detailed drawings should show no more work than was clearly defined—as to cost—by the drawings and descriptions already furnished. It is, unfortunately, a common practice with some architects to prepare their detail drawings, utterly regardless of what is shown on, or may be implied by, their general drawings. This may arise from: (1) Incompetence: the architect may be quite incapable of preparing his details before the contract is signed. (2) Neglect: the architect may be well able to prepare his plans; but through pressure of work, or some other cause, he fails to do so. (3) Dishonesty: the architect may want good work or rich work for little money. He will, therefore, furnish vague general drawings only before the contract is signed, and then, under cover of the clause "The work is to be done to the architect's satisfaction," he will, after the contract is signed, proceed to furnish the builder with details involving an amount of work no one could have anticipated by the most careful examination of the general drawings. It should never be forgotten that when a contract is signed binding a builder to execute a certain amount of work for a fixed sum of money, any addition made to that work without a corresponding addition being made to the contract sum is at the builder's expense, and if enforced by any of the architect's self-protective claims, then the transaction is nothing less than sheer robbery. Again, architects will delay furnishing details when required by the builder, and this neglect may involve the latter in considerable loss. His masons, joiners, or other tradesmen may be actually standing still for want of information not given in the general drawings, and he finds himself powerless to proceed with the work, or to recoup himself for this enforced idleness. An amusing incident arising out of this neglect to furnish drawings occurred a few years ago in connection with a church restoration. A building committee contracted with a builder to restore a church some fifty miles from London. Soon after the works were well in hand, it became necessary to apply to the architect for details of door and window jambs, none of which could be worked from the small-scale drawings furnished to the builder when the contract was signed. The architect neglected to reply to the builder's application for the details. Week after week passed, but no drawings were forthcoming. During this time the builder, at considerable expense to himself, frequently visited the church; his foreman was, of course, retained, with some few workmen, in anticipation of the receipt of the drawings. Still none came. The building committee at last became impatient at the delay, and summoned the builder to meet them at the residence of the chairman of the committee, and explain why the works at the church were not being proceeded with. The builder attended, and informed them that he could not proceed with the works as the architect had not furnished him with the necessary drawings, and he was consequently powerless to complete the contract, through no neglect of his. The committee, however, declined to see the matter in this light. They pointed out that the builder had signed a contract to complete the works by a certain date, and it was "nothing to them" whether the architect furnished details or not! The builder said he could not force the architect to supply him with drawings. The committee replied "neither could they"; but they could enforce the penalty against the builder for non-completion of the work in the contracted time, and meant to do it." In this instance the drawings were at last furnished, but some time after the work should have been completed. The penalty for delay was not enforced, and the architect, feeling hurt that the builder should have informed his clients of the delay in furnishing drawings, made himself as disagreeable as possible in all the subsequent proceedings in connection with the contract. As a matter of business, the detail drawings should be prepared and submitted to the builder when he makes his estimate, or to the surveyor when he prepares his quantities. It passes the wit of man to discover how the modern first-class quantity surveyor can take off his microscopical quantities from small-scale drawings. That in some cases he fails to do so is perhaps clearly shown by the inclusion of such items in the quantities as "Provide so many rods of brickwork," "Provide so many cube feet of stone," "Provide so many cube feet of timber," all to be deducted if not required? To provide for "eighteen inches of bird's-mouth cutting to brickwork," and then wind up with a provision for "Ten rods of brickwork in cement, to be deducted if not required" is uncommonly like straining at a gnat and swallowing a *canal*, as a Dublin paper rendered camel some time ago! In connection with this question of drawings it may perhaps be well to suggest to the builder that when he is favoured by the architect with original drawings to prepare his estimate, he—the builder—will, if he is a wise man, have them photographed before he parts with them. This he can easily do, whether they are in ink or pencil. Several plans may be pinned up on a wall and photographed on one plate. This plate will always show unerringly what the plans were like when the estimate was prepared. The facility with which a clever draughtsman can alter a plan is shown by the following incident. It became necessary to apply to a public body for a grant towards the erection of a certain building. The grant was made, and the customary approval written on the corner of the drawing, the seal of the public officer being also attached. On looking over the drawings some time after, various improvements were suggested; but how were the alterations to be effected, as the plans were all endorsed and sealed? Nothing was easier! The paper used was Whatman's "Double Elephant," and gentle rubbing with a piece of number "0" sandpaper left a clean sheet, with nothing but the title, scale, border, approval, and seal on the surface. Every trace of the original drawing had disappeared, the amended building was now put on, the work carried out, and the grant paid over to the promoters, none of the parties to the matter knowing anything of the change but the architect and his assistant. In this case no loss was inflicted on any one. True, if a similar method were adopted by an unprincipled man, a very grievous injustice might be done by altering a signed drawing where no infallible record had been kept of such drawing at the time of signing it.

CHIPS.

At a general meeting of the Institute of Painters in Oil Colours, Piccadilly, held on Wednesday evening, Messrs. W. A. Breakespeare, J. S. Hill, and Lance Calkin were elected members.

The Meyrick Park and Golf Links, which have been laid out by the Bournemouth Town Council, were opened on Wednesday. The land, which comprises 126 acres, and is valued at £100,000, was handed over to the town council, Sir George Meyrick waiving his rights in the property. The total outlay has been £12,000, and of this amount £9,000 was received for land sold, leaving only £3,000 to be provided by the ratepayers. Sixty acres have been devoted to golf links. The length of the course, comprising 18 holes, is 2¼ miles. The ladies' course of nine holes is 700 yards in length, and covers an area of four acres. Ten acres have been laid out for cricket, football, bowling, &c.

Mr. Charles Burton Barber, the well-known painter of dogs and *genre* pictures, died on Tuesday, aged 49 years.

Plans have been prepared by Mr. Peter Whyte, superintendent to the Leith Dock Commission, for a casual dock labourers' shelter, to be built at Constitution-place, Leith, and for the erection of offices for the use of the company porters and stevedores in connection therewith. The work will be proceeded with shortly. The estimated cost is £1,500.

At a special meeting of the West Ham Town Council, held on Tuesday, Alderman J. H. Bethell moved that the honorary freedom of the borough be given to Mr. J. Passmore Edwards, in recognition of the great interest he has taken in its welfare, and in appreciation of his munificent gifts for the benefit of local institutions. Mr. Alderman G. Hay seconded the resolution, which was supported by a number of members of the corporation, the gift of 1,000 books to the free library, the erection of a wing to West Ham Hospital, and the donation of £1,000 to the funds of the hospital being mentioned as acts indicative of Mr. Edwards's interest in the borough. The resolution was carried with one dissentient.

The example of the New York Municipal Art League, which has already led to the formation of a similar body in Boston, has not been lost on Philadelphia; and, a few days ago, committees, representing the Pennsylvania Museum, the Drexel Institute, the School of Design for Women, the Philadelphia Art Club, the Spring Garden Institute, and the Department of Architecture of the University of Pennsylvania, met for the purpose of appointing a general committee, to confer with the Public Building Commission on the subject of the mural decorations of the council chambers in the new Philadelphia City-hall.

Building Intelligence.

Ackworth.—To meet modern requirements in the way of technical instruction, new workshops have recently been added to the fine block of buildings known as the Society of Friends School at Ackworth. The new extension, which was opened on Thursday, the 22nd ult., by Mr. Thomas Pumphrey, of Newcastle, the chairman of the School Building Committee, has been erected by Mr. John Simpson, of Ackworth, from the designs and under the superintendence of Mr. William H. Thorp, F.R.I.B.A., of 61, Albion-street, Leeds.

Altrincham.—The new cemetery was opened on the 21st inst. The undertaking has been carried out at a cost of £9,000. The chapel is a characteristic example of Gothic architecture of the 14th century. It is faced entirely of Halifax stone, and provides sitting accommodation for 70 people, and, in addition, comprises large mortuary, vestry, &c. The works have been carried out from the designs and under the superintendence of Mr. Wm. Owen, A.R.I.B.A., 134, Deansgate, Manchester. Mr. John Matthews, of Nantwich, was the principal contractor.

Bath.—At the meeting of the Baths Committee at Bath on Friday, Mr. J. M. Brydon, F.R.I.B.A., of London, the architect of the Pump Room extension, was in attendance with reference to suggested alterations in the plans adopted by the Council. It was decided not to cover the water of the large Roman bath, and also that the new promenade room should be reserved entirely for music, while the present pump room should be enlarged. The Mayor also thought that the idea of a museum for antiquities, taking the whole basement, should be dropped, and that a portion in the best-lighted position only should be utilised for the purpose. Mr. Brydon undertook to produce amended plans to the committee to-day (Friday). A suggestion by a Mr. Lewis that while Mr. Brydon should be architect of the new building, Major Davis should have direction of the work at the Roman bath (!) was not favourably received.

Birmingham.—A new chancel was added last autumn to the Roman Catholic Church of St. Catherine, in the Horse Fair, Birmingham, and the work of embellishment is being carried out by Mr. G. O. Owen, from the designs of Mr. W. J. Wainwright, a Birmingham artist. The altar is now enriched with a series of paintings of canonised saints, which were unveiled on Monday. The altar is built of Caen stone, and is now adorned with twenty-three lancet-shaped panels 2ft. 6in. in height, each panel containing the figure of a saint painted on a gold ground, in spirit fresco. The centre panel is occupied by the figure of the Virgin Mary, in robes of blue. St. Catherine is painted on the panel on the one side, and St. Clare on the other. Others of the paintings represent St. Edward the Confessor, St. William of York, St. Thomas Aquinas, and St. John Chrysostom. The work of embellishing the chancel will be carried out. The ceiling will be decorated in spirit fresco with figures of the Prophets of the Old Law, whilst the spandrels will be filled with figures of the Saints of the New Law. The figures will be treated in the traditional colours on a gold ground.

Hexham.—New premises have just been erected in Beaumont-street for the proprietors of the *Hexham Courant*. The buildings have a frontage of 33ft. to the street, and cover an area of 3,300sq.ft. On the ground-floor are the public office, manager's office, strong room, and postal despatch room. The printing department is at the rear, and has an open roof with top light. On the first floor to the rear are the compositors' room and paper stores, and on the floor above are the editorial rooms. The whole establishment is warmed by hot water on the low-pressure circulating system. The front elevation is simple Renaissance in treatment. The works have been carried out from the designs and under the personal supervision of Messrs. Marshall and Dick, of 4, Northumberland-street, Newcastle. Mr. Edward Snowball, of Hexham, is the sole contractor.

Morningside, Edinburgh.—The Free Church at Morningside was formally opened on Saturday. The building is designed in a phase of the Renaissance period, with a campanile tower at the south-west corner, the building of the upper stages of which it is intended to leave for the present in abeyance. The building being surrounded on back and sides by adjoining properties, the distinctive architectural features are confined to the tower and street front. The plan of the church is an elongated rectangle, and it comprises the church area, with recessed pulpit platform and organ chamber at one end, with spacious vestibule and staircases at the others. The material used for mason work is red Corsehill stone, for the constructive woodwork red pine, and for the finishings yellow pine. The cost has been about £9,600. Mr. Hippolyte J. Blanc, A.R.S.A., of George-street, Edinburgh, is the architect.

Rawtenstall.—The new Liberal Club at Rawtenstall was opened last week by Mr. J. H. Maden, M.P. The building is in Lord-street, opposite the municipal buildings, and so far has cost about £800. The complete plan, which has been designed by Mr. Heys, of Rawtenstall, shows a frontage of 90ft. to Lord-street and Annie-street. The building-line is 60ft. deep. Only a portion of the plan has been carried out so far, and the block opened on Saturday comprises a cellar 47ft. by 27ft. and 8ft. high, and on the ground floor an assembly-room, 31ft. by 27ft., with a newsroom 21ft. by 12ft. and 14ft. high. The contract was let to Councillor Hanson.

Sheffield.—The cottage homes, built by the Sheffield board of guardians at a cost of £30,000, were opened by Sir Walter Foster, M.P., on Saturday. The buildings are situated on the Goddard Hall estate, in Smilter-lane, Crabtree. The administrative block contains a waiting-room, medical officer's and examination-rooms, with bath, sitting-rooms for the foster parents, kitchen, separate day-rooms for boys and girls, lavatories, baths, and store-rooms. In the same building the residence for the superintendent is placed, so as to command the entrance from the road and the various buildings. The three detached homes which at present complete the headquarters, each have a piece of garden, a playground, a shed, and a washhouse. The children's hospital is on the same estate. Mr. C. J. Innocent, George-street, Sheffield, has been the architect; Messrs. George Longden and Son, Neepsend, were the contractors; and Mr. George Malpas, the clerk of works.

Wolverhampton.—A post-office is about to be erected in New Lichfield-street, a leading thoroughfare formed under an improvement scheme. The building will be erected on a vacant piece of land between the Grand Theatre and the Criterion Hotel, and it will also occupy the whole corner of Princess-street, and run back to Berry-street. The architect is Mr. H. Tanner, of London, from whose designs new post-offices are now in course of erection at Liverpool, Leeds, and Nottingham; and the quantities have been taken out by Messrs. Harris and Harris, of London and Bennett's Hill, Birmingham. The latest date for the receipt of tenders for the building of the office is to-day (Friday), and the chief Birmingham and Wolverhampton builders have sent in tenders. The post-office will have a main frontage of 128ft. 3in., and it will be in the Renaissance style. It will be built of red brick, with buff terracotta dressings, and the roof will be covered with green slates. Of two stories, the facade will be completed by a pair of gables, whilst the centre will be accentuated by a flèche. In the basement there will be storerooms and workshops, and the ground floor will be occupied principally by the public office. The hall, which will be 51ft. by 30ft., will be lighted by four large windows. The sorting-room next Princess-street will be 85ft. by 36ft. On the second story of the main building will be the telegraph-instrument room, 52ft. by 31ft., and above will be other storerooms. Rooms have been set apart as cooking and dining apartments, lavatories, and cloakrooms, and retiring-rooms for the female portion of the staff. The entire building will be fireproof, the staircases and corridors being paved with stone, and the floors constructed of concrete upon iron joists. The cost of the building is expected to be about £12,000. The red bricks for the facing will come from Kingswinford, the firebricks from Stourbridge, the terracotta from Ruabon, and the green roofing slates from the Tilberthwaite Quarries, Lancashire.

* * *

The Royal Humane Society has conferred its silver medal upon Mr. W. Mugford, foreman of works, Torquay town council, for saving the two labourers, Milton and Potter, in the main outfall sewer when it collapsed on the 20th ult.

COMPETITIONS.

Coventry.—The City Council of Coventry are about to invite designs for complete municipal buildings which are to embrace the historical St. Mary's Hall and some other ancient buildings which have for many years been used for municipal purposes. They invited, by advertisement, architects who had had some experience in similar work, and who were willing to compete, to send in their names, with drawings or photographs of their executed works, and 25 names were sent in. The city council have selected eight of the applicants, who, together with any Coventry architects who may desire to compete, will be supplied with the instructions and plan of the site available. The city council have been advised in the preparations of these instructions by Mr. Charles Barry, F.S.A., and have appointed him as their assessor in the selection of the best designs. A premium of £150 is offered for the best design, and £50 each to the authors of the design adjudged worthy of the second and third place. Designs are to be sent in on the 2nd March, 1895. As the new building will be carried out in sections from time to time as means become available, a special provision is made for a payment of 1¼ per cent. to the architect appointed, or to his representatives, on the estimated cost of the unexecuted portions of his design if no orders for their execution be given within seven years from the award.

Exeter.—The committee of management of the West of England Eye Infirmary at Exeter are proposing to erect a new building on the site of the present premises in Magdalen-street, and in August last they invited architects to send in designs in competition on instructions issued. The designs are to be delivered to-day (Friday). The committee have appointed Mr. Charles Barry, F.S.A., late President of the Royal Institute of British Architects, as their assessor to advise them in the selection of the most suitable design. This competition is to be a dual one. From the designs sent in at first (which are to be to a scale of 16ft. to an inch) not fewer than three or more than six will be selected by the assessor for the final competition (drawings to be 8ft. to the inch), and to each of the architects so selected an honorarium of 25 guineas will be paid. The successful architect in the final competition is to be employed as architect to the building on the usual professional terms. The work is intended to be commenced at once; but if its commencement should be delayed for two years after the award, the architect is to be paid 100 guineas (in addition to the honorarium), and his design will then become the property of the committee.

Merthyr Tydfil.—The guardians for the Union of Merthyr Tydfil have recently selected, from twenty-five other candidates, Mr. E. A. Johnson, M.S.A., of Abergavenny, for the appointment of architect for their new infirmary which is to be built at Merthyr, at an estimated cost of over £10,000.

Youlgreave.—In a limited competition for a new Primitive Methodist church and schools at Youlgreave, Derbyshire, the plans of Mr. Hy. Harper, Market-place, Nottingham, architect, have been accepted.

* * *

The Local Government Board have consented, with certain stipulations as to the purification of the sewage, to the erection near Banstead Downs of a hospital for the isolation of patients suffering from infectious diseases, and the Epsom Joint Hospital Board, by whom the hospital is projected, have unanimously agreed to accept the conditions.

A chapel, which has been added to the British Home for Incurables at Streatham, was dedicated on Wednesday. The style is a modern treatment of the Late Early English. The interior is of red brick, the roof being supported by clustered stone shafts. On the south side there is a narrow aisle, and on the north a wider aisle, supported by a double arcade. At the western end there is a gallery on the level of the first floor of the building. The cost has been £1,800.

An inquiry was held at the Town-hall, Weston-super-Mare, on Friday, by Mr. J. W. Bird Clerke, an inspector from the Local Government Board, respecting an application of the local board for a loan of £2,149, for widening Locking-road. This road forms the main entrance to the town for all vehicular traffic arriving from Bristol, and it is proposed to widen the road throughout to 36ft., and to remove several objectionable curves and corners. Mr. Nettleton produced plans of the proposed improvement, and gave details in connection therewith.

Correspondence.

HALF-TIMBERED HOUSES AND CARVED OAK FURNITURE OF THE XVI. AND XVII. CENTURIES.

To the Editor of the Building News.

Sir,—I am very much obliged to you for your kind notice of my work on the above subject in your issue of the 23rd inst. In your reviewer's description of the "Court cupboard surmounted by a livery cupboard," now standing in an hotel at Tunbridge Wells, he has fallen into a slight misapprehension, which I shall be glad if you will kindly allow me to correct. In writing of these cupboards, he says, "The two have been *fastened* together, as shown by the sketch." This is not the case. The livery cupboard appears to have always stood in the same position; but there is no appearance, as far as I could ascertain, of their ever having been fastened together, though the accurate way in which they fit each other might lead the casual observer to suppose that this had been the case. It was, indeed, in the first place my own supposition. Since the publication of "Half-Timbered Houses, &c.," I have received a photograph of a very primitive livery cupboard, which is supported on one of the walls of a room by brackets. The sides and ends of this cupboard are formed of plain turned balusters, as in the case of those at St. Alban's Cathedral. If any of your readers have any of these quaint old cupboards in their possession, or are able to give any information about them, or can kindly lend me any sketch or photograph of one, I shall be very pleased to hear from them. I have heard that there existed some time ago in Yorkshire several cupboards, one or more of the divisions of which contained cupboards with open balusters. These, no doubt, in the houses of the middle classes, answered the purpose of the once separate court and livery cupboards, and some of them probably are still in existence. I have in my own possession a sketch of a cupboard of this description, which had at one time been handsomely painted and decorated. It is not, however, of English manufacture.—I am, &c.,

William Islip Sander.

2, Cathcart-road, South Kensington, S.W.

FIREPROOF CONSTRUCTION.

Sir,—Mr. Potter's letter of the 16th inst. is a valuable testimony to the truth of the principles embodied in my patents. The first principle is *severance*—that is, the steel joists are separated from every substance that comes in contact with the flames; and the second is *conductivity* as distinct from *non*-conductivity, a *taking away* of the heat rather than retarding its progress to the metal by incasing it with some so-called non-conducting material.

Mr. Potter proposes to further protect the lower flange of the steel joist than is provided by a suspended ceiling by encasing it with earthenware. This either increases the thickness of the floor, or by reducing the air-space between the steel joist and ceiling, defeats the object of the suspended ceiling.

I fully endorse all Mr. Potter writes concerning ordinary hair and lime plaster as a fire-resisting material. But there are three qualities essential in a "fireproof" plaster: First, that it should stand fire; second, that it should not corrode iron; and, third, that it should not absorb water and become soft after it has once set. Ordinary plaster supplies the first and second requisite, but not the third. Most of the advertised "fireproof" plasters fail in both the second and third.

An ordinary plaster ceiling constructed with metal lathing withstood the flames perfectly; but when the engine hose was played on it with considerable force it not only softened the plaster, but washed it out of the lathing altogether.

This result induced me to seek for some new and inexpensive material which would fulfil the three conditions above named. The materials experimented upon have perfectly met the requirements. After being subjected to white heat for 65 minutes, and water at 80lb. pressure poured upon it, the plaster was perfectly uninjured.

I observe that Mr. Potter, referring to his own experiments, says:—"The only effect was that the metal lathing assumed a corrugated form from expansion." This is sure to be the case with all lathings formed out of sheets of iron or steel, especially so with those which have only a thin coating of plaster on the lower face and none at all on the upper. A fireproof metal lathing should be *entirely embedded* in the plaster to preserve it from rust and crumpling under heat.

Helical lathing, in addition to its other merits, offers one advantage over all others. It cannot expand or contract. The expansion expends itself in the twist, so that the ceilings remain perfectly flat at all temperatures.—I am, &c.,

J. LEWIS BANKS.

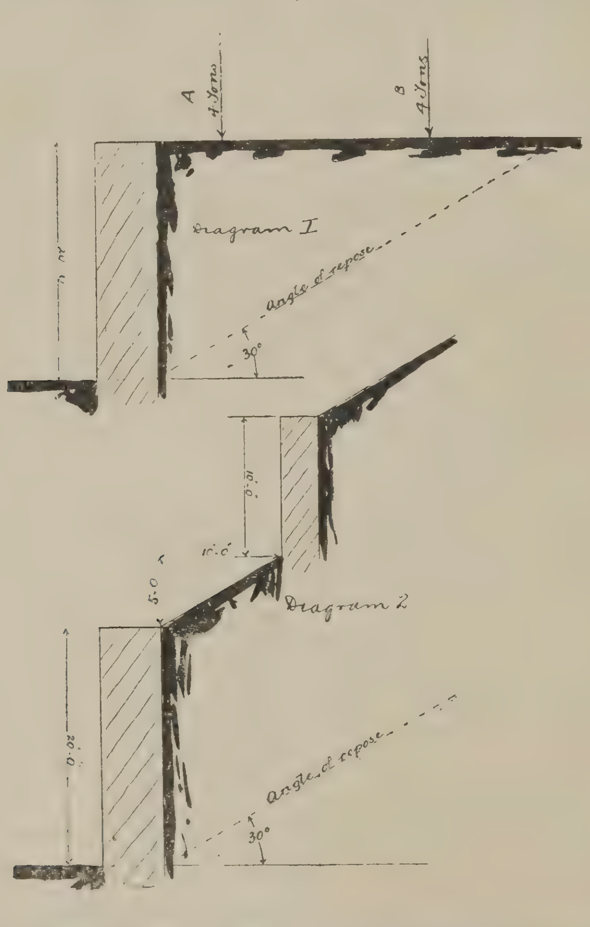
Intercommunication.

QUESTIONS.

[11252.]—**Surveying.**—Will one of your surveyor readers kindly inform me which is the best and most practical work on surveying and levelling (with instructions for the use of instruments), from which a novice can best learn the methods?—PUPIL IN DOUBT.

[11253.]—**Ball-room Floors.**—Would any of your numerous readers kindly tell me where I could get any information about the construction of ball-room floors, the object being to get the greatest amount of springiness consistent with strength? I believe they are sometimes hung on chains.—A.R.I.B.A.

[11254.]—**Thickness of Walls.**—Will some of your readers kindly let me have the necessary diagrams and working to obtain the thicknesses of the above walls? Firstly, with a load of 4 tons per lineal foot at A, neglecting B. Secondly, with the load at B, neglecting A. Also the working for diagram 2.—RAILWAY.



[11255.]—**Cockroaches.**—Can anyone give me a cure for cockroaches? In a hotel service room, in the pipe-boxes, pantry, and other places they swarm in thousands, and get on the dining-tables, and are a perfect plague. Can anyone assist me to get rid of them?—COCKROACH.

[11256.]—**Building on Made Ground.**—Will some reader kindly say whether it is practical to build on filled-up ground without carrying the footings of walls down to the level of virgin soil? Having heard of some small villa residences being built with the ordinary brick footings on 3ft. or 4ft. of filled-in clay, I should like to know whether this is customary with this class of building. Would a footing of cement concrete 2ft. 6in. wide be sufficient to prevent unequal settlement?—ENQUIRER.

◆

Benjamin Creswick, R.B.A., formerly of Liverpool, and now professor of modelling at the Birmingham School of Art, has presented to the permanent collection at the Walker Art Gallery in the first-named city a group in clay representing "Rugby Football." The great difficulty in sculpture is the group, which the artist has essayed to solve by representing in pyramidal form three life-sized figures engaged in a scrimmage at a critical moment of the game.

Legal.

A RESTRICTIVE COVENANT.

IT is a very common thing for freeholders to insist upon having a covenant in their conveyances, that the premises sold shall not be used as a public-house or beer-shop. In the ordinary way, such a covenant is easily construed and inferred by the Court. But under certain states of fact, there may be a difficulty in defining whether this covenant has really been broken. An interesting and important point of this kind arose in the recent case of "Duke of Devonshire v. Simmons and Another" (*Times*, November 17). There the plaintiff applied for an injunction to restrain the owner of the land, who held under such a covenant, and the lessee of certain premises, known as the Alexandra Hotel, Eastbourne, from using them as a public-house or beer-shop. It appeared that the place had until recently been used as a boarding-house without a license. The premises had, however, now been converted and enlarged, and opened as a first-class private hotel. Then the lessee obtained from the justices a full license to sell wines, beer, and spirits, but subject to the undertaking that no beer on draught would be kept, and that no bar trade whatever would be done. In other words, the license would be used solely for the purpose of supplying the wants of visitors to the hotel.

It was now argued that this private hotel could not be distinguished in law from a "public-house," and also that a place where beer could be sold was a beer-shop, within the meaning of the covenant. But Mr. Justice Stirling thought otherwise, and refused to grant the injunction. He admitted the importance of the case, especially in localities like Eastbourne, where such restrictive covenants were common, and were inserted to keep up the residential character of the neighbourhood. He considered that there was a substantial difference between a private hotel like this one and a public-house, especially after the undertaking given by the defendant—that only visitors to the hotel should be supplied with wines and spirits, and that no beer at all should be sold upon the premises. It is probable that there will be an appeal from this judgment, and this ultimate decision will be looked for with interest by many who hold land under similar restrictive covenants, by which they are hampered. But it is by no means certain that this ruling will be supported, or that so easy a mode of evading the covenant will be of general application.

FRED. WETHERFIELD, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

NOTE.—All questions for reply in this column must be headed "BUILDING NEWS," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

NOSYD.—BUILDING.—CONTRACT.—MATERIALS.—I don't consider that the architect could do as is suggested; but it appears to me that he might give seven days' notice in writing to remove bad materials and put in good, and that if contractor still refuses, the owners might terminate contract on the ground of a breach within the meaning of Clause 14. One doubt is, how did these materials get passed?

◆

LEGAL INTELLIGENCE.

DRAIN OR SEWER?—JONES v. BANTER.—In the Queen's Bench Division on Saturday, before Mr. Justice Collins, an application was made by Mrs. Jones, owner of Nos. 2 and 4, Winbolt-street, Bethnal-green, for an injunction restraining Mrs. Banter, the owner of Nos. 6 and 8, Winbolt-street, from allowing to continue obstructed the free passage of running water and soil from the plaintiff's houses along the drains and sewers under the defendant's premises. Both plaintiff and defendant held their respective premises on leases granted by the same ground landlord, and by the leases plaintiff was entitled to a free passage for the water and soil coming from her houses into and along the drains and sewers under the defendant's premises. A short time since the defendant was served by the Vestry of St. Matthew, Bethnal-green, with notices alleging that the system of drainage in connection with her houses was defective, and calling upon her to relay and make good the same. Believing that it was her duty to comply with the notices, she called in a builder, who relaid the drains to the satisfaction of the Inspector of the Vestry. The level of the drain of No. 6 was altered, with the result that the drainage from No. 4 could not flow into it. The Vestry subsequently threatened the plaintiff with proceedings for creating a nuisance, and she applied to Mr. Justice Day at Chambers for an injunction restraining the defendant from continuing to obstruct the flow of the drainage of No. 4 into the drain of No. 6, and the judge referred the application to the Court. The plaintiff now contended that the defendant ought not to have paid any attention to the notices of the Vestry, because the pipe through which the sewage passed was not a drain, but a sewer, and therefore repairable by the local authority. She further asserted that the defendant, by carrying out the work, had converted a sewer into a drain, and thereby rendered plaintiff liable to penalties for an alleged nuisance. Mr. Justice Collins, after hearing the evidence, said the pipe in question was admittedly a sewer, and not a drain, and therefore the local authority was liable to remove any nuisance, and not the defendant. Following the case of "The Attorney-General v. Colney Hatch Lunatic Asylum," he granted an injunction, and awarded plaintiff 40s. and costs.

CHARGE AGAINST A BUILDER.—At Southwark Police-court on Monday, Mr. Fenwick gave his decision in the summons brought against Mr. J. H. Winsford, builder and contractor, of Charlotte-street, Blackfriars-road, at the instance of Dr. Herron, medical officer of the St. Saviour's District Board of Works, for that he, being charged with the responsibility of laying new drainage to premises situate in Blackfriars-road, used as a common lodging-house, did so execute the work that it was dangerous to health by reason of there being a leakage in the pipes laid down. The case has been several times before the Court. Mr. Fenwick said he had come to the conclusion that the drains were so laid down that they might be objectionable and injurious to health, and he therefore must convict on the summons, and order the defendant to pay the mitigated penalty of £20 and 2s. costs.

LIGHT AND AIR.—MAYNARD v. LONDON SCHOOL BOARD.—This was an action for damages to a house and shop, No. 84, East-lane, Bermondsey. The interference was the erection of a high school building. The technical witnesses for the plaintiff were Professor Banister Fletcher and Mr. E. B. F. Fuller, of the firm of Messrs. Fuller and Fuller, for the defendant Board; Mr. H. H. Collins and Mr. J. F. Field, of the firm of Messrs. Field and Sons, for the plaintiffs. The amount of damages claimed was £200, and it was alleged on behalf of the defendant Board that there was no money injury whatever. Verdict, £100 and costs.

◆

At the meeting of St. Paul's Ecclesiological Society held on Wednesday evening at St. Paul's Chapter-house, E.C., Mr. J. Grimshire gave a lecture, illustrated by limelight views, on "The Basilican Churches of Rome and Ravenna."

Our Office Table.

THE London County Council discussed for some hours on Friday the cost of the work performed by the Works Committee of the Council, adjourned from October 30. A further report of the Works Committe stated that where the quality of the work did not enter into consideration, or when it could not vary much, such as the excavation and brickwork in a sewer, the cost of the works compared most favourably with the cost of those undertaken by a contractor. On the other hand, in architectural work, where the cost had exceeded the estimate, the committee claimed for their work a quality which was only comparable with that executed by builders of the highest class, who rarely, if ever, undertook work at competitive prices. The manager stated that in his estimates he assumed the work required would be of the ordinary quality, whereas the highest class had been demanded of him. Eventually an amendment moved by Mr. Westacott for the rejection of this paragraph was rejected, and the report of the Works Committee approved. A recommendation by the committee that it be referred to the General Purposes Committee to consider and report as to the advisability of framing standing orders which will provide for the approval of the Council being obtained to the ascertained cost of works executed by the Works Committee—was also agreed to, after several amendments had been discussed and rejected.

MR. C. H. READ, of the British Museum, who undertook for the London County Council, without remuneration, the task of opening up the tumulus on Parliament-hill, has furnished the Council with a report of his proceedings. The conclusions at which Mr. Read has arrived as to the character of the mound are:—(*a*) That it is without question an artificial mound, raised at a spot where there was originally a slight rise in the ground; (*b*) that a great quantity of additional material was added to it, chiefly on the northern and eastern sides, and probably within the last two centuries; (*c*) that the tumulus has not been opened before; (*d*) that it is very probably an ancient British burial mound of the Early Bronze period, and, therefore, centuries before the Christian era. The burial was probably by inhumation, and the bones have entirely disappeared—a circumstance by no means uncommon. In this interpretation of the evidence his opinion is supported by that of Canon Greenwell, whose lengthened experience of these burials enables him to speak with an authority beyond question upon this point. Mr. Read pays a tribute to Mr. George Payne, F.S.A., of Rochester (who was with him during the whole of the work), and whose geological knowledge and experience in this class of exploration was of great value.

AMONG the Parliamentary schemes to be brought forward next session, in addition to those mentioned by us last week, are proposals for the revival of powers and extension of time for the completion of the Acton Junction line of the Metropolitan District Railway; an extension of time for the completion of the underground railway of the City and South London Company; the construction of a railway from the L. C. and D. station at Bromley to Hayes and Farnborough; alterations and deviations of the London, Walthamstow, and Epping Forest Railway; a new line of railway from the Great Western line at Uxbridge to the Metropolitan Company's system at Rickmansworth; the abandonment of the Metropolitan Outer Circle Railway; and an extension of time for the carrying out of the Parliament-street, Westminster, improvement scheme.

THE council of the Glasgow Institute of Architects have presented a memorial to the corporation regarding the designing of public buildings in the city. In the memorial it is set forth that in the case of the Municipal Offices in George-square, and that of the Art Galleries in course of erection by the Association for the Promotion of Art and Music in Glasgow, a desire was shown, and some consideration given, to secure that the designs should be worthy of the important purpose that each of those buildings was to serve. With buildings of secondary, but still of great, importance, no corresponding effort is made. They submit that the design and arrangement of such buildings are, as much as those of the larger edifices, worthy of every attention and care that can be bestowed upon them. The Institute are of opinion that the designing of important public buildings cannot be satisfactorily done by the department of the master of works, or of the city engineer, and still less when the head of that department is an engineer than when he is an architect. The duties of the office include many other duties which, in a city of such magnitude as Glasgow, must be of a very onerous nature. To relegate the designing of important works of architecture to the assistants of a gentleman who is responsible for the efficient discharge of such duties as the foregoing, and who is himself not an architect, seems to the institute to indicate a want of appreciation of the position which architecture should occupy in an important city.

IT is reported from Athens that the commission of Greek and resident German architects which was recently appointed by the Greek Government to consider what measures are necessary for the preservation of the Parthenon, which was considerably shaken by the recent earthquakes, has been unable to agree. The Government has therefore requested the German Government to send its "most reliable State architect" to advise them in the matter.

AT the twenty-eighth annual convention of the American Institute of Architects, held in Chicago on Oct. 15, in the Fine Arts building, 105 members were present—a larger number than usual. The president, Mr. D. H. Burnham, of Chicago, delivered an address, in which he deprecated the practice of showing designs to customers without payment. The secretary, Mr. Stone, read the annual report of the board of directors, from which it appears there is a membership of 475 fellows. There are also 26 chapters, chartered by the Institute, having an aggregate of 600 members, of which about 500 are practising architects. The New York Chapter has the largest membership—namely, 86, of whom 60 are practising members, the remainder honorary and junior. Illinois has 82 members, of which 80 are practising. Philadelphia 55, of which 31 are practising. The other chapters range from 8 to 20 members. The next convention meets at St. Louis. Mr. Daniel H. Burnham, of Chicago, was re-elected president, and Mr. William S. Eames, St. Louis, secretary.

On Wednesday in last week Colonel Marsh, R.E., inspector of the Local Government Board, held an inquiry at the town-hall, Selby, into an application of the Selby local board of health for sanction to borrow £775 for gasworks purposes, and £590 for works of water supply.

The head office of the Bank of Liverpool, standing at the corner of Water-street and Fenwick-street, Liverpool, is about to be rebuilt from the designs of Messrs. Grayson and Ould, of that city. No expense is to be spared in making this building one of the most perfect in Liverpool. The work will be executed in two separate contracts, so as not to interfere with the carrying on of business. The fireproof floors are to be on the "Fawcett" system, the contract for which, together with the whole of the constructional iron and steel work, has been given to Messrs. Mark Fawcett and Co., of Westminster.

Major Tulloch, M.I.C.E., held an inquiry at the town-hall, Wednesbury, on Wednesday week, on behalf of the Local Government Board, respecting an application made by the town council for sanction to contract a loan of £800 towards providing a metallurgical laboratory and £120 towards the cost of making up Oldbury-street, New Town. The Town Clerk stated that some time ago the Staffordshire County Council intimated their intention of making Wednesbury a centre for technical instruction in the South Staffordshire district, and the Wednesbury town council then expressed their willingness to share the expense of erecting the new school, finding furniture and equipment, and also providing a lecturer. The estimated cost of the building and site was £1,850. One-fourth of the sum would be paid by the County Council.

The foundation-stone of St. Edmund's Roman Catholic Church, Miles Platting, was laid on Saturday by Dr. Bilsborrow, Bishop of Salford. The architects are Messrs. Pugin and Pugin, of London, and the contractors Messrs. Robert Neill and Sons. The total cost is estimated at about £10,000. The church will provide accommodation for 1,100 persons. At the corner of Monsall-street and Mary-street a tower will ultimately be erected. The total length of the church internally will be 125ft., the width 65ft., and the apex of the roof will be 62ft. above the level of the ground. The materials will be local bricks, with Runcorn stone dressings.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Society of Engineers. "The Principles and Practice of Hydro-Extraction," by H. B. Ransom. 7.30 p.m.

Royal Institute of British Architects. Business Meeting. 8 p.m.

A.A. Camera Club. "Camera Studies of Architecture," by E. W. M. Wonnacott. 8 p.m.

Liverpool Architectural Society. "The Economic Value of Fine Architecture," by Alderman P. H. Rathbone. 6.30 p.m.

Glasgow Philosophical Society. "An Old Glasgow Architect on Some Older Ones," by T. Gildard.

TUESDAY.—Institution of Civil Engineers. Further Discussion on "The Machinery of War-Ships." "Colliery Surface Works," by E. B. Wain. 8 p.m.

Glasgow Architectural Association. "Planning of Farmhouses," by C. J. Davidson. 8 p.m.

WEDNESDAY.—Society of Arts. "The Electrical Treatment of Sewage," by E. Hermite. 8 p.m.

FRIDAY.—Architectural Association. "The Modern Theatre of the Continent," by E. O. Sachs. 7.30 p.m.

CHIPS.

At the last meeting of the North Riding county council, it was agreed, on the proposition of the finance committee, that Mr. J. Vickers Edwards, of Wakefield, county surveyor for the West Riding, should act as assessor to assist in selecting the designs for new County Buildings, in respect of which the premiums are to be awarded, and that he be paid a fee of £73 10s. and his travelling expenses.

The death occurred at Sunderland on Friday of Mr. F. G. Rotherford, the founder of the United Property Owners' Association of Great Britain, at the age of 63. The cause of death was cancer.

The bells of Leominster Priory Church, which have been recast and added to, were rededicated by the Suffragan Bishop of Shrewsbury on Tuesday week. The peal now numbers ten, being the only one above eight in the county, with the exception of those in Hereford Cathedral tower. Eight have been recast, and two new trebles have been added, the founders being Messrs. Warner and Sons, of London.

A new infectious diseases hospital is in course of erection at Bournemouth from the designs and under the superintendence of the borough engineer, Mr. Lacey. It has been decided to make the floors fireproof, and the contract for this portion of the work has been placed with Messrs. Mark Fawcett and Co., of Westminster.

The Admiralty have decided to remove the Vanguard Shoal in Plymouth Sound, thus greatly improving the entrance to Devonport Dockyard. The work, which will occupy several years, will be commenced at once.

The Wednesfield School Board have accepted the tender of Mr. Thomas Tildesley, of Willenhall, for the erection of the new school at Wednesfield, to accommodate 314 children. The cost of the buildings will be £2,198.

St. John's Church, Truro, has just been renovated at a cost of about £1,000. Messrs. Clemens and Battershill were the general contractors, and Mr. Nichols executed the font and other carving.

A new Freemasons' Hall was dedicated at Yeovil by Viscount Dungarvan on Friday. The building is two floors in height, and contains on each floor a room 40ft. by 22ft. Brother Johnson is the architect.

In the case of Frederick Taylor, late Quick's-road, Wimbledon, S.W., builder, trading with James George Elliff Taylor, as Taylor and Son, the discharge from bankruptcy has been suspended for two years, ending Oct. 12, 1896. In that of William Biden Young, High-street, Wimbledon, S.W., late Weybridge, builder, the discharge has been suspended for three years, ending Oct. 12, 1897.

At Bournemouth sessions, on Friday, a license was granted for a new building known as the Pavilion, which is nearly completed, at Boscombe, Bournemouth. The building has cost £15,000, and will seat 4,000 people.

Lady Rawlinson laid on Monday the foundation-stone of a new Primitive Methodist chapel, which is to be erected in London-road, Brighton, at a cost of about £4,300, part of which sum has been raised by the sale of the old chapel in Viaduct-road.

A Methodist central hall, for evangelistic and philanthropic work, has been opened in Belfast. The large room will seat 2,500 persons. The cost is over £10,000.

The Caledonian Railway Company opened their new line from Hamilton Hill to the Glasgow Queen's Dock on Monday. The new line taps seven coal depots, and will enable coal to be sent direct to the quay side at Glasgow, and the Caledonian will save by the new railway £20,000 annual tollage to the North British Company.

Trade News.

WAGES MOVEMENTS.

HARROGATE.—The strike at the Harrogate baths still continues so far as the masons are concerned, but the work of the bricklayers and their labourers, joiners, navvies, and others is proceeding rapidly. The masons' work is well forward, and the principal business at present is the internal brickwork. Consequently Mr. Gould, the contractor, considers it will pay him better for the men to be off the job for six or eight weeks. He has just put down a new steam stone-dressing machine, which dresses two sides of a stone at the same time, and the task is well and more evenly done than can be done by an ordinary mason. The chief reason the masons have turned out, the delegates say, is because they have to take their food from home, and no mess-house is provided. The men also object to the bricklayers' foreman dismissing a mason. The masons will continue the strike.

CHIPS.

A new organ was dedicated at Holy Trinity Church, Oswestry, on Thursday in last week. It has been built by Messrs. Hele and Sons, Plymouth and Exeter, and cost about £600.

The foundation of two houses in course of erection in Great Portland-street, at the back entrance of the Queen's Hall, suddenly gave way on Tuesday, while some dozen workmen were engaged on different floors. Two men were seriously injured and taken to the Middlesex Hospital. One subsequently died.

A new pumping station at Liscard, which has been constructed by the Wallasey Local Board, at a cost of £35,000, was opened by Mr. Thomas Snape, M.P. The new works will practically double the water supply of the district of Wallasey. They have been carried out under the direction of Mr. H. Ashton Hill, engineer to the board. Messrs. Marr and Son were the general contractors, and the boring for the well has been done by Messrs. Vivian and Co. The well is 12ft. in diameter, and 175ft. in depth.

Statues of SS. Mary and John, each about 6ft. high, by Earp and Hobbs, of Lambeth and Manchester, have just been placed in position at All Saints' Church, Middlesbrough. They occupy niches on the interior walls of the north and south-western ends of nave.

The Emperor William will open the new building of the Reichstag at Berlin on Wednesday next, the 5th of December, with great pomp and ceremony. His Majesty will receive the key from Herr Wittich, the chief executive architect, and be addressed by Professor Wallot, the architect who designed the building, and will then lay the keystone of the portal.

Mr. John Bell, of Lockner Holt, Chilworth, Surrey, the founder of Bell's Asbestos Company, died a few days ago after a short illness.

At Widnes Town Hall, an inquiry was held on Tuesday, by Mr. Arnold Taylor, an inspector appointed by the Local Government Board, into the application of the town council for permission to borrow £11,503 for the extension of the gasworks, £4,200 for works of private street improvement, £4,100 for the acquisition of a depot for nightsoil refuse, and £1,500 for sewerage works.

The new out-patients' department of the Women's Free Hospital in Portland-terrace, Southampton, was opened on Tuesday week. The new building consists of a large waiting-room for out-patients, capable of seating some 80 persons. Below this room is a doctors' consulting-room, and a second waiting-room. Mr. Ingalton Sanders, of Southampton, was the architect, and the work was carried out by Mr. A. Warden, of Fitzhugh.

The London and North-Western and the Great Western Railway Companies contemplate extensive improvements at Shrewsbury station and in the railways near it. The station was built half a century ago, and the need of additional accommodation has consequently become very pressing. It is proposed to widen the viaduct which crosses the Severn on the Birmingham side of the station. Two other bridges on the other side of the station are also to be widened, additional land is to be acquired, new lines are to be laid down, and the station generally is to be greatly extended. A new approach for foot passengers is also to be made from the Abbey Foregate and Belle Vue districts.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXVII.—No. 2083.

FRIDAY, DECEMBER 7, 1894.

REAL AND SHAM DESIGNERS.

TWO sorts of designs are represented in competition drawings, one kind exceedingly simple, very often inadequately and meagrely drawn, exhibiting the appearance of haste, the other kind elaborate, often pretentious, and drawn with masterly effect. The general or superficial observer will at once come to the conclusion that the elaborately-drawn set is by far the only one deserving of attention. The author has at least taken the trouble to draw it effectively, to appeal to the eye, knowing that this is the wisest policy when a committee of not very critical persons are the adjudicators, and public opinion has to be consulted. On the motto that a "thing that is worth doing is worth doing well," we are compelled to admire the care and the labour spent on the executive part of a design. To set forth an indifferent thought or idea artistically, to make the most of the draughtsmanship, is commendable in itself, if people and competition judges only understood how to distinguish between design and drawing. But they do not, and therefore the latter wins; so much the worse for the real designer, and the better for the tactical one.

It has been said by a well-known essayist that Shakespeare's principal merit may be conveyed "in saying that of all men he best understands the English language, and can say what he will." And is not this the precise merit of the real designer? He best understands the language of art or of architecture, and can say what he likes. Not, mind, what pleases, but what he thinks is the best. The real artist can see quicker than other people, and can interpret his wants directly and simply as no other man can. No doubt this meaning or expression often shocks the common perception of people; it is often positively distasteful to them, as when they see a blank wall where they look for a window, or a plain tile roof instead of balustraded and crested finish, or a bare vertical parallelopiped of brickwork for an elaborate tower. How strangely repulsive to the ordinary eye after florid Italian and Gothic erections was the bare, little-paned sash window in a wall of red brick and many of the quaint devices introduced on the revival of Dutch "Queen Anne"? People laughed and scoffed at the seeming impertinence and audaciousness of making our villas and civic buildings like old 17th-century manor houses. They hardly believed that the revival would be seriously maintained. It was too much of a joke to see the leaders of architecture one after another following each other—men, too, who had been purists; but did not these leaders have an inkling of what was true and honest? Did they not see the folly of trying to Gothicise or Italianise our buildings? All became clear to the mental vision when the style or revival was looked at in this light.

And precisely the same surprise is evinced by those who, comparing the work of real and pseudo-architects, observe with astonishment the indifference of the former to all kinds of cheap display and adventitious aids. Look, for example, at the manner many leading architects draw their competition designs. In many recent exhibitions of these designs—as, for instance, in that of Christ's Hospital Boarding School—the drawings submitted by one or two leading architects were extremely bare and meagre—quite unworthy of the design for so important a building. A well-known architect, who has been largely engaged in university and other buildings, sent in a set of drawings of the most crude and perfunctory kind—plain, matter-of-fact elevations of the various blocks, that could not have escaped notice by the side of other designs admirably and artistically set forth. In the competition for the South Kensington Museum extension, many must have noticed the same declension in the style of drawing, and only the other day we examined two designs for a free library to be built in the north of London, by leading architects, who, probably on the strength of their reputation, sent in very poor and indifferent drawings, which surely puzzled many. On the ground that "good wine needs no bush," the authors of the designs abstained from doing anything which could be thought to emphasise the merits of their work. From the point of view held by these leaders, anything approaching professional tactics is ignored. Because mere draughtsmanship, in their eyes, is misleading and derogatory to the real character of art, they have discovered how many competition drawings have belied the actual design, that the association of draughtsmanship and design has often proved delusive—that, in fact, good design has frequently emanated from men destitute of the facile pencil, and who have disdained the assistance of the professional artist.

We have not to go far to seek a solution of the matter. The real architect puts on paper exactly what he wants, no more and no less, and he knows what he wants. If he is drawing a window or a doorway in elevation, he represents it by no more lines than will express his intention, and, if he can, he will try and express his meaning with as *few* lines as possible. Thus a jamb containing shafts and members will be simplified by defining only the deeper shadows or hollows. If it is an ornament or a cornice, he will be equally particular not to make it more important or more elaborate. No doubt this rule, if carried out in elevations of ordinary buildings, produces a meagre appearance. The pseudo-architect designs in excess. He makes more lines than necessary on paper to express his meaning, he exaggerates the size and importance of features because he does not know exactly what he wants, and puts his drawing in place of design. Precision is not his *forte;* he beats about the bush till he finds something that will please him and look effective. Let us take a few simple cases to illustrate our meaning. A plain level roof, with hipped ends, is considered ugly by the quasi-artistic mind, and forthwith he adds such features as end pavilions or Mansard terminations. The level cornice or parapet is distasteful, and is superseded by a number of gablets or dormers. These features are not actually wanted, but they are introduced for the sake of appearance, and to make the elevation attractive. The real architect objects to them; he would simply emphasise the plain hipped roof and eaves line. Again, the quasi-designer is not fond of plainly following the necessities of plan or construction by dropping a roof or ridge line over a part which is not carried up. He carries on his elevation or lines level by some disguise. Hence we see that while one elevation presents a return façade of the same height as a front, another will boldly break his elevation, so as to make it conform to the interior requirements. He does not attempt to compromise, but to make picturesqueness out of necessity. His attention is clearly and unmistakably expressed, instead of being timidly manipulated to produce a regular effect. In such things as chimneys, turrets, cupolas, we notice the same prevarication and dodging; they are made higher or lower, more or less ornamental, just to suit the vagaries of the designer, who is not exactly sure of his meaning. We see it also in detail. An iron support in the hands of some men is made to represent a Corinthian column, or some other elaborate form. The real artist would fashion it with a simple and unostentatious capital, forming a cradle with brackets or studs. The former does not hesitate to use cast iron in such forms as crests for ridges, brackets, and finials; the latter would repudiate such use of ornaments. The excess in design which we have attributed to the pseudo-artist is seen also in details like ornamental leadwork, such as pipe-heads, finials, hip-knobs. The ordinary plumber does not express his own meaning, but "executes" a design of somebody else; and in like manner throughout all the trades where design enters, the lack of directness of aim has been prejudicial.

Excess in drawing and excess in design and ornament are the main qualities which distinguish the sham from the real designer. Facility of pencil often outstrips the power of conveying the artist's thought—in proof of which we may instance a florid and pretentious drawing which has no definite character. And the same facility may be seen in language. A crude and imperfect thought is often wrapped up in a redundant speech by a man who has no distinct idea of his meaning. And it is this surplusage of the means of expression which has given to professional artists their chief success. It will be a long time before the public are made to distinguish between the real and the counterfeit. People are easily led away by impressions and clap-trap. They are not able to strip off the adventitious extrinsic from the real and essential, and it is this difficulty which has hindered them from distinguishing a good from a made-up design. An obvious want clearly and simply expressed is always less popular than a flimsy disguise. Architects have, of course, to gain a reputation as much by their drawing as by their executed designs, and it would be absurd to deny that much of their success depends on designs skilfully prepared. Those who have gained a reputation by their executed buildings can afford to undervalue the aid of the draughtsman and the many subterfuges of tricky drawing and colour, but it ought not to deter them from sending skilful and artistic representations of their designs. To do otherwise is disrespectful to those who invite their services and to the profession they represent. On the other hand, the experience of recent competitions ought to have its lesson in bringing about a more healthful reaction. Excessive elaboration of detail and a trashy, misleading kind of draughtsmanship have, no doubt, partly been the cause why the leading members of the profession have become disgusted with the tactics of competing members, and have sought to make a protest against the too-frequent habit of putting rival draughtsmanship in the place of design. There is, no doubt, much to complain of even now in this direction. Even the experienced professional assessor cannot always affect an honest disregard of a clever artistic get-up; many are unconsciously led captive by the snares laid by the artful expert in disguising portions of the design. Against this tendency to try and win by extraneous aids, a few of the leading lights of the profession have revolted, and their eagerness to show their disdain of competing on such terms has led them into a position sometimes almost unnatural, if not grotesque.

ROYAL SOCIETY OF PAINTERS IN WATER-COLOURS.

THE present winter exhibition of the "Old" Water-Colour Society shows that the older conventions are still prevalent among members of this society. The early traditions of the art still linger in the works of Birket

Foster, Fripp, Callow, Carl Haag, and some others. Two admirable figure studies by J. Henry Henshall show that his pencil is versatile in depicting subjects other than melodramatic incidents. "The Stool of Repentance" (2) represents a flaxen-haired little girl standing on a stool, her dog behind, for some act of insubordination; while another version of the same idea is "The Naughty Girl" (23), where the little delinquent is standing, her face to the wall, with her arms behind her, holding the detached or broken head of her doll. The drawing is excellent, and the expression in the eyes of the young culprit indicating the unruly temper is strong; but there is a too boy-like look about the face. Thomas M. Rooke's beautiful drawing of "Sculpture on the West Porch, Chartres Cathedral" (9), is executed by subscription for the Birmingham Town Museum. Mr. Rooke has faithfully delineated in detail the jamb and colonettes of this great portal, the statues of saints, and the beautiful enriched capitals and abaci above them are portrayed, showing the Byzantine feeling of the work. His other views of Chartres (17) and the carved bracket on the house of the Sulmon, Chartres, show equal care and feeling. Miss Clara Montalba has no less than eight examples of her colour harmonies, all Venetian subjects, rendered with inimitable beauty and delicacy of colour. These are ivory-like in their soft, subtle tones, as in "Early Morning, Venice" (6), "Shipping on the Guidecca" (66), "Before the Storm" (144), and one or two on the screens, amber-toned studies of light and colour. What a charming piece of grouping and colour is the sketch, "A Venetian Welcome," where the placid lagoons are brightened by the colour of gaily-decked gondolas and banners. Tom Lloyd is strongly represented, too, on the walls. His garden scenes are daintily drawn, of suffused warm sunlight and summer evening tranquillity. "Cherry Ripe" is a walled garden bathed in warm sunlight, with children. "Gone" (22), a lady and her dog watching the gliding away of a punt on the river, in a summer evening glow. "Summer Time" (78), "After Dinner" (185), are also pleasing studies in their way of the summer moods of life, soft and melodious in colour. In sharp contrast are the works of Robert W. Allan, whose Dutch harbours and landscapes are, as usual, full of strong colour and vigorous handling. "Goes, Holland," is a capital view of the picturesque market-place, with its groups of people and the background of municipal buildings. "Montrose Harbour" (150) is fresh in colour, and the blottesque touch and vivid light and movement of this master may be seen in several other works and sketches, as in "A Scotch Fishing Village" (262). Lionel Smythe is a charming painter of rustic scenery and children. "Songs without Words" (27), two children in a wood, their hands in one another's, looking up at a tree, listening to a feathered songster, is full of grace, sentiment, and beautiful colour. The spring woodland, the daffodil-spangled ground, and the charming simplicity of the two little wanderers are excellent. "A Picardy Lass" and "Gooseberries" (342 and 345) are both delightful studies.

Albert Goodwin contributes a large number of his drawings, full of subtle colour and atmosphere. The view of "Bridgnorth" (94), from an old bridge in the foreground, is a charming subject, masterly handled in crow-quill and colour. The heavily laden waggon on the bridge and the distant view of the pretty Shropshire town, with its hilly background, church tower, and houses in red brick and tiles, make an attractive subject, and Mr. Goodwin's technique is well suited to such a theme. His other views of "Clovelly" (48), with its cliffs and harbour, also a delicately drawn harmony of "Lynmouth" (114), with its blue sea seen through delicate foliage of autumnal tints; of "Lucerne" (142), "St. Mary, Redcliff, Bristol," and "Portsmouth," are equally clever compositions, full of colour, in one case a red sunset glow, and in another quite Turneresque in prismatic harmony. Drawings of "Wells" and "Venice," and of "Dartmoor Prison" make up a very large collection of this industrious artist's work. The latter, with its figure of a fugitive in the foreground, is perhaps the least satisfactory; but there is a true poetic meaning to be discovered in all of them.

Miss Rose Barton's new departure shows that her sympathies and talents are not entirely devoted to drawing London streets, parks, and squares. In "Noonday" there is evidence of ability in quite a new direction. It represents a peasant woman trudging along over a ploughed field in the heat of an autumn day, exquisite in feeling and painted with all the subtle power and pathetic suggestiveness of toil that Clausen has given us. The solitary figure of the peasant in a wide expanse of stubble-field in the hands of many would have been purposeless and commonplace; but Miss Barton has, by subtle drawing and subdued colour, imparted to those simple elements a true pathetic interest. The grey mist rising over the landscape suggests the close of a toilsome day, and the qualities of maternal care and patience are written in the figure and gait of the lonesome figure. In the same vein are her drawings, "Returning from Hop Picking" (154), peasants and children wending their way homewards in a grey, misty evening; "Tower Bridge from Cherry Garden Pier" (67), and "Cromwell Road."

Samuel J. Hodson's drawings of "Verona" (60), "Dordrecht" (90), "Hoorn" (81), are careful and sympathetic. Sweet and melodious in colour and feeling, Mrs. Allingham contributes two delightful cottage studies—"A Surrey Cottage" (89) and "Cottage near Freshwater" (202)—both charming examples of her power of investing simple country life with exquisite grace and sentiment. In a similar class of subject we welcome again the conscientious art of Birket Foster, one of the oldest members, in such delightful subjects as "A Suffolk Well," "June in a Cottage near a Wood" (188), a group of children at a stile, "On the Beach, Southwold" (219), all full of painstaking drawing of gambolling country children, and of English rustic life. The work of Alfred D. Fripp, the secretary, is confined to Italian scenery. "The Campagna of Rome from the Via Appia" (213) is a pleasing subject well handled. George A. Fripp sends several drawings in his finished style. "Egglestone Abbey" (30), "Distant View of the Isle of Mull" (181), are examples; the latter is full of sunlight, and the coast and bay, with its pebbly beach, are carefully drawn. W. Callow sends also several drawings. "Venice from St. Giorgio" is perhaps one of his best. "Canal in Ghent" (229) is also strong in those qualities for which this master has achieved success—strong masses of light and shadow, and excellent drawing. One of the few figure-subjects is E. R. Hughes's "Biancabella, and Samaritana, her Snake Sister" (251). The subject is taken from "Straparola," a modern French fairy legend. A beautiful girl, quite nude, stands in a basin of white liquid or milk, in a secluded part of a garden, the green bank of which forms the background to the figure. She has a green-hued snake entwined round her body and limbs. The snake is "moulding" into beauty the form of her earthly sister, so the tale goes. Beautiful as the drawing of figure and the technique is, there is wanting imaginative power in the picture. Below it is G. H. Andrews' large picture of "Blast Furnaces at the Iron and Steel Works, Barrow-in-Furness," a rather uninviting subject. William Pilsbury paints delicately "May Blossom" (278). Professor Herkomer sends an interesting "Design" (296), and some sketches, and a portrait of his wife. The heads in chalk are admirable studies of light and shade. Frederic Shields' "Obedience" (292) is another clever decorative design in ink-shaded outline, and on the screens we note some nice drawings by Walter Crane, Herbert Marshall, Sir O. W. Brierly, R. Thorne Waite, Lionel Smythe, and especially a very clever figure-study by J. R. Weguelin (360), a nude figure of "Pelagia" standing on a glistening sea-beach against the blue sea, admirable in drawing and colour.

THE LONDON BUILDING ACT, 1894[*].

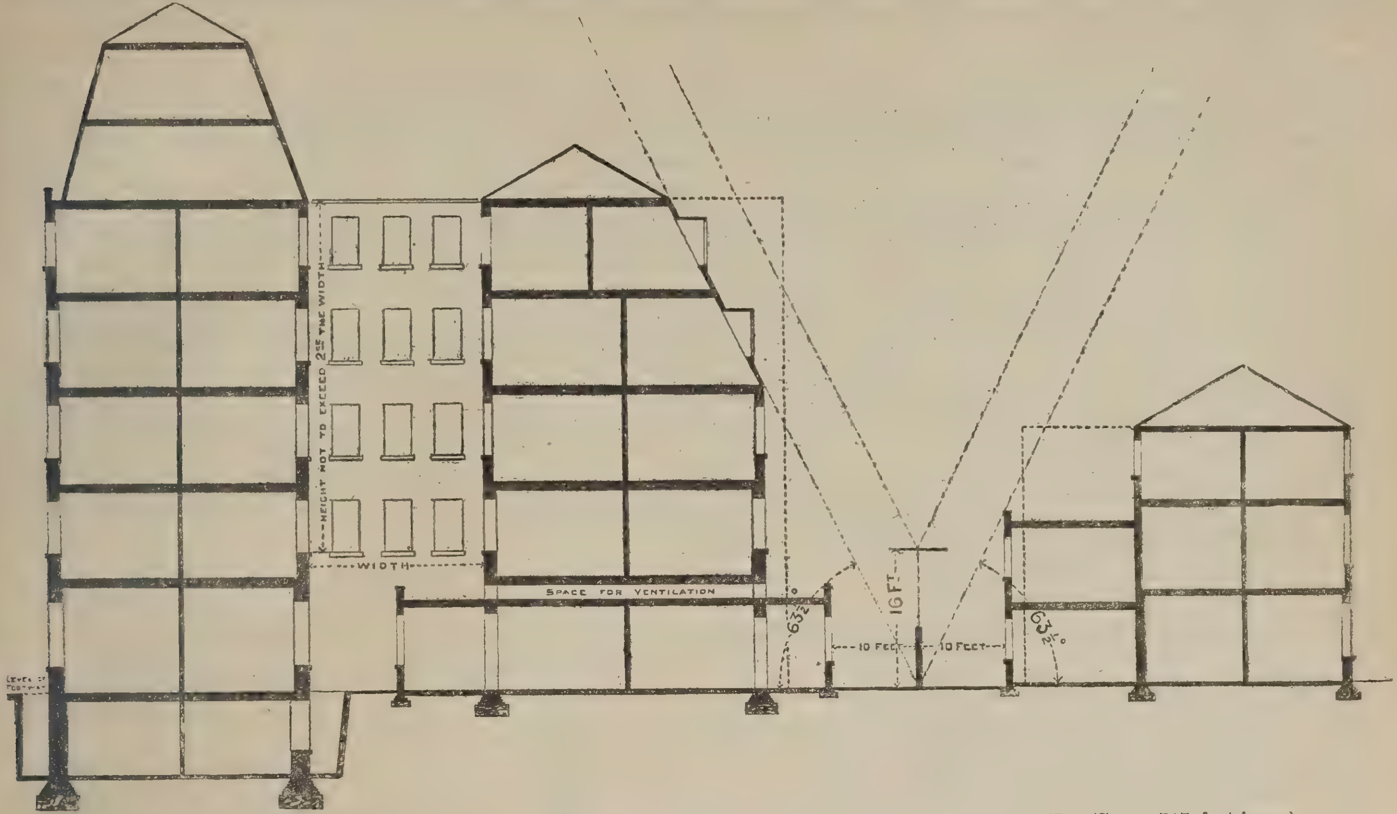
(*Continued from page* 748, *last issue.*)

THE section relating to courts within a building, for light, air, and ventilation, is divided into two parts—viz., courts inclosed on all sides, and courts inclosed on all sides except one. If a court is inclosed on all sides, and its depth to the ceiling of the ground story exceeds its length or breadth, adequate provision must be made and maintained by the owner for the ventilation of such court by means of a communication between the lower end of the court and the outer air. The expression "adequate" is rather vague, and it does not appear who is to decide as to what is considered adequate, and there is no reference to the Tribunal of Appeal in this section. No habitable room is to be lighted and ventilated into a court inclosed on all sides, unless the width of the court is equal to half its height. The height is to be measured from the sill of the window to the eaves or top of the parapet of the opposite wall. It is somewhat uncertain whether it is the vertical line which is to be taken in measuring the height, or the diagonal line, as the Section states "from the window sill to the eaves or top of the parapet of the opposite wall." A court inclosed on all sides can be made oblong in shape if it contains as much superficial area as a square one, provided the length is not greater than twice the breadth. Courts inclosed on all sides except one, and the length being greater than the width, cannot have the window of a habitable room lighted into it unless the distance from the window to the opposite wall is equal to half the height of such wall, measured from the window sill. Every habitable room must now open into the external air, and the size of the window or windows in such habitable room, is to equal to $\frac{1}{10}$th of the floor space, half of which is to be made to open. Habitable rooms may, however, be lighted by a skylight or dormer, and in that case the window is to equal $\frac{1}{12}$th of the floor space, half of which is to open. Staircases in tenement houses must be ventilated upon every story above the ground story by means of windows or skylights, opening directly into the external air, or shall be otherwise adequately ventilated; but who is to determine what is adequate ventilation is not stated. Staircases to ordinary dwelling houses have also to be ventilated by means of a window or skylight, opening directly into the external air. Ventilation is also required under the floors of basements, except where the floor is of solid wood blocks bedded on concrete.

The height of buildings in old streets—*i.e.*, streets laid out before the 7th of August, 1862, is now restricted to 80ft. and two additional stories in the roof; but towers, turrets, or other architectural features or decorations are excluded from the restriction, as also are churches and chapels. This, however, does not prevent you from completing a building taller than 80ft. if begun before the passing of the Act, or from rebuilding a building which now exceeds those dimensions, or of continuing a row or block of existing buildings belonging to the same owner exceeding 80ft. high to an equal height. The Council have power to consent to buildings being erected exceeding this limit of 80ft.; but they must within one week after giving consent publish the fact for the benefit of adjoining owners being within 100 yards of the site. These adjoining owners, if they object, may appeal to the Tribunal within 21 days, and should the Council refuse to consent to any building exceeding 80ft. high, the applicant can also appeal to the Tribunal. In a street formed after the 7th August, 1862, and of a less width than 50ft., no existing building is to be raised, and no

---

[*] By Ellis Marsland, Hon. Sec. Society of Architects, and District Surveyor of Camberwell. A paper read before the Society of Architects on Tuesday, Nov. 27, 1894.



Section of Domestic Buildings Erected under the London Building Act, 1894, Parts V. and VI. (See p. 747, last issue.)

new building is to be erected so that the height of such building shall exceed the distance of the front or nearest external wall of such building to the opposite side of such street, unless with the consent of the Council. A church or chapel is excepted from this section. Where a corner building abuts upon streets of different widths, the height is regulated by the wider street, and this height may return along the narrower street for 40ft. The height of habitable rooms is increased from 7ft. to 8ft. 6in., except for rooms wholly or partly in the roof, and these may be 8ft. throughout not less than one-half the area of such rooms. This will prevent the formation of three stories within the limit of height of a 9in. wall. Living-rooms over a stable have now to be separated from the stable by a concrete pugged floor, or floor of other solid construction, 3in. in thickness, and the soffit of the stable is to be ceiled with lath and plaster. The access to the living-rooms is to be separated from the stable by a 9in. brick wall.

We now turn to the additional clauses relating to safety from fire in private buildings, and from fire and panic in public buildings. Every dwelling-house or factory having a parapet is to be provided with a dormer window or door opening on to the roof, or with a trapdoor furnished with a fixed or hinged step-ladder leading to the roof, or with other proper means of access to the roof. Any story in the roof of any domestic building, the floor of which is 60ft. above the street level, shall be constructed of fire-resisting materials throughout; and every new building exceeding 60ft. in height, the upper stories being 60ft. above the street level, is to be provided with such means of escape in case of fire as can be reasonably required under the circumstances of the case, and no such stories are to be occupied until the Council shall have issued a certificate that the provisions of this section have been complied with. In the clauses dealing with chimneys and flues, section, 64, clause 4, a flue is not to be adapted to or used for any new oven, furnace, cockle, steam-boiler, or close fire used for any purpose of trade or business, or to or for the range or cooking apparatus of any hotel, tavern, or eating-house, unless the flue be surrounded with brickwork at least 8½in. thick from the floor on which such oven, furnace, cockle, steam-boiler, or close fire is situate, to the level of the ceiling of the room next above the same; and a flue is not to be used in connection with a steam-boiler or hot-air engine unless the flue is at least 20ft. in height, measured from the level of the floor on which such engine is placed. The floor under every oven, copper, steam-boiler, or stove which is not heated by gas, and the floor around the same, is to be for a space of 18in. formed of materials of an incombustible and non-conducting nature, not less than 6in. thick. The floor over any room or inclosed space in which a furnace is fixed, and any floor within 18in. from the crown of an oven, is to be constructed of fire-resisting materials.

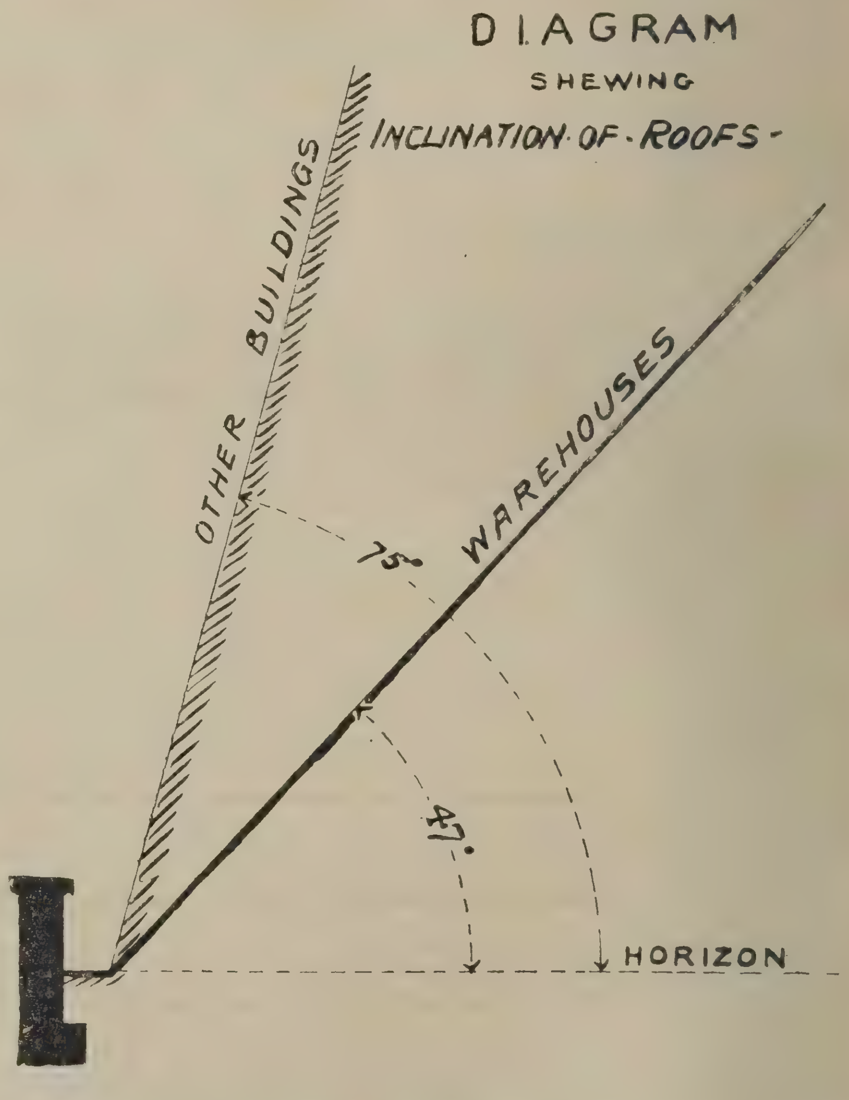
A most important provision as affecting the safety of shop assistants and the pockets of the shopkeeper is contained in Section 74. In every building exceeding 1,000sq.ft. in area used in part for purposes of trade or manufacture, and in part as a dwelling-house, the part used for the purposes of trade or manufacture is to be separated from the part used as a dwelling-house by walls and floors constructed of fire-resisting materials, and all passages, staircases, and other means of approach to the part used as a dwelling-house shall be constructed throughout of fire-resisting materials. The part used for purposes of trade or manufacture shall, if extending to more than 250,000c.ft., be subject to the provisions of this Act relating to the cubical extent of buildings of the warehouse class. It is, however, provided that there may be constructed in the walls of such staircases and passages such doorways as are necessary for communicating with the different parts of the building, and there may be formed in any walls of such building openings fitted with fire-resisting doors. It does not seem at all clear. however, if the openings from the business part into the domestic part are to be fitted with fire-resisting doors; to make the section of any use, it should have been distinctly stated, and that the openings should be closed with iron doors, for if we refer to the schedule defining fire-resisting materials, we find that an oak or teak door, 2in. thick, is considered fire-resisting. Another important clause is: In every building exceeding 2,500sq.ft. in area containing separate sets of chambers or offices or rooms tenanted by different persons, the floors and principal staircases shall be of fire-resisting materials. The limit of cubical space for buildings of the warehouse class has been increased from 216,000c.ft. to 250,000c.ft., but there are certain exceptions to buildings situate at a greater distance than two miles from St. Paul's, and used for certain specific purposes, constructed of brick, stone, or iron, and of one floor only. The council, however, have power to consent to buildings up to 450,000c.ft. provided they do not exceed 60ft. high, and are not used for the purpose of any trade or manufacture involving the use of any explosive or inflammable materials. The rules as to openings to be provided in party-walls separating large buildings are somewhat altered. The size is 7ft. by 8ft., as at present, but the number is limited to one-half the length of the wall. If, however, the distance between the iron doors in each side of the wall is not less than 24in., the opening may be 9ft. 6in. in height. Respecting the safety from fire and panic in public buildings, several provisions have been added which it is most important for the architect to note. Every staircase for the use of the public shall be supported and inclosed by brick walls not less than 9in. thick, and the treads of each flight of stairs shall be of uniform width.. No staircase, internal corridor, or passage-way for the use of the public shall be less than 4ft. 6in. wide, except where the accommodation is for only 200 persons, and then the passage-way may be 3ft. 6in. wide. The width of the staircases, internal corridors, or passages is to be increased by 6in. for every additional 100 persons above 400, until a maximum width of 9ft. is obtained, and a handrail is to be provided up the centre where the width is 6ft. and upwards. You may, however, if you prefer it, substitute two staircases, corridors, or passages for one; then in that case they need be but two-thirds of the width of a single staircase, but in no case less than 3ft. 6in. You also want a separate set of staircases, corridors, and passages to each gallery where you have more than one. All doors and barriers shall be made to open outwards, and no outside locks or bolts are to be fixed thereto. All staircases, corridors, passages, and landings are to be constructed of, and carried by, supports of a fire-resisting material. All public buildings have to constructed in such a manner as may be approved by the district surveyor, or in the event of disagreement may be determined by the Tribunal of Appeal, and no public building is be used as such until the district surveyor or Tribunal of Appeal shall have declared his, or their, approval of the construction thereof. This, I think, exhausts all the new clauses under my second head.

We now turn to the additional structural requirements. The most important of these is the additional thicknesses required for walls. I give (p. 779) a diagram, showing in black the thickness of walls under the old Act, with the additional thickness shown in outline required by the new. It will be observed that the height of walls of dwelling-houses jumps from 25ft. to 40ft., and although you may have two stories of 8½in. work to a building 25ft. high, if it exceeds this height, and you go to three stories, the lower two have to be 13in. thick, even if a part of the third story is in the roof. The thickness of walls is increased in most cases, and, I think, only in one case—in warehouse walls—are they reduced in thickness. The new Act does not countenance hollow walls, for, if they are constructed, there is to be a wall on one side of the hollow space of the full thickness described by the Act. The footings of walls are somewhat altered. They are to project on each side to half the thickness of the wall, as at present, but their height is to be two-thirds the thickness, and where an external wall is built against another external or party-wall the footings on the one side may be omitted. The underpinning of walls is to be done in cement, and where a wall is thickened, this also is to be done in cement. The top six courses of all chimney-stacks are also to be built in cement. There is an additional rule with regard to cross-walls wherever a cross-wall becomes in any part an external wall. Such cross-wall shall be of the thickness required for an external wall of the same length and height.

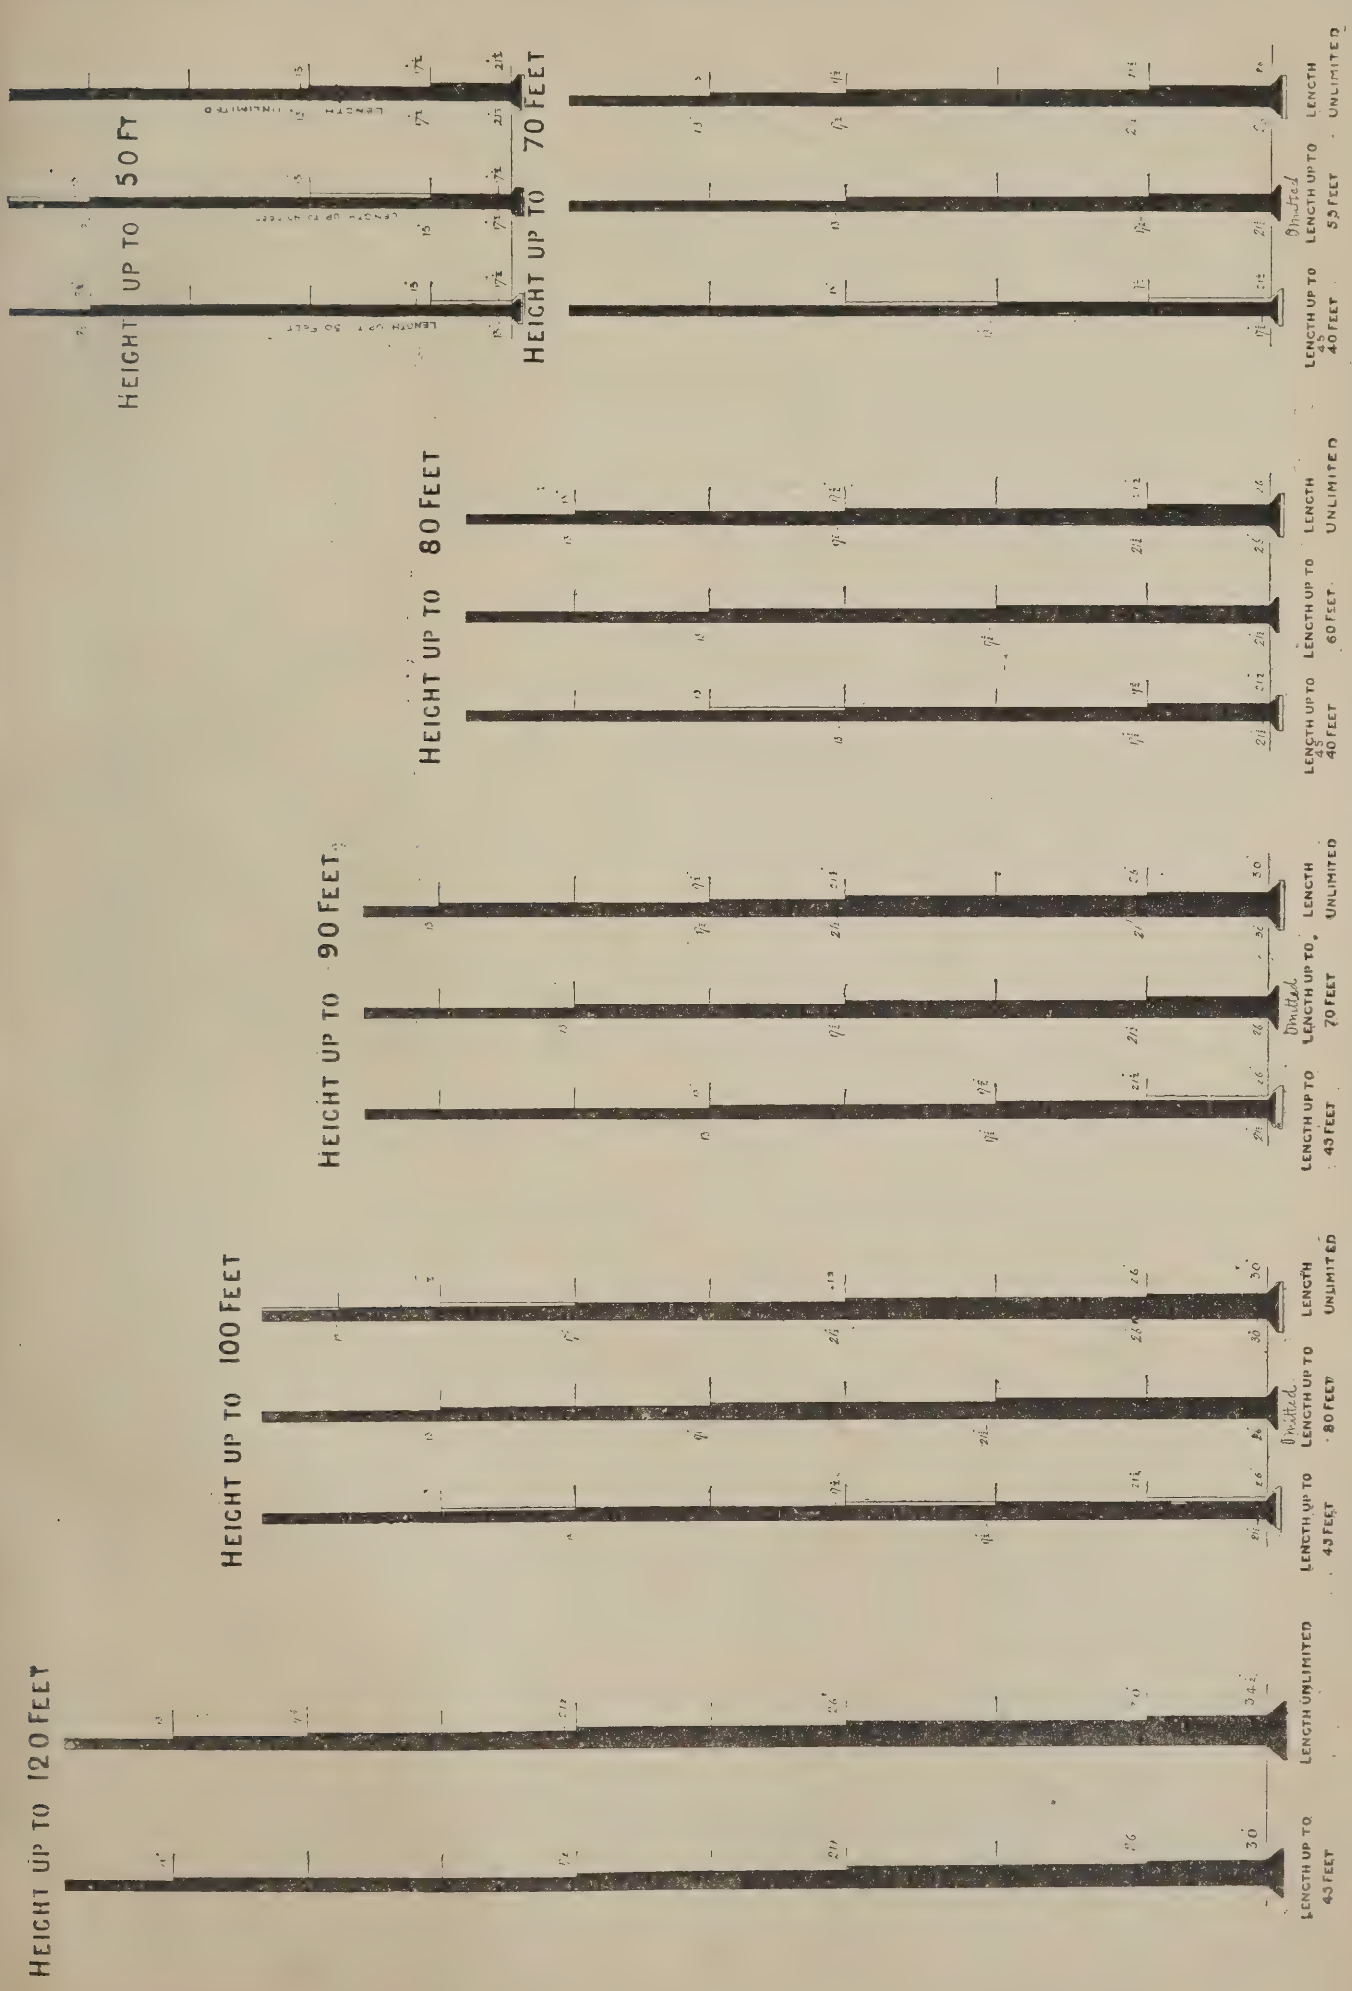
Sections 65 and 73 will be welcomed by architects, as they will save them a considerable amount of time and delay in preparing their plans. Under the present Act, if we desire to erect a furnace chimney shaft, or project a bay window or oriel beyond the general line of frontage, an application was necessary to the Council; but under the new Act a furnace chimney shaft may be erected without this preliminary, provided that it taper at the rate of 2½in. in 10ft., that the top 20ft. is 8½in. thick, and that every additional 20ft. measured downwards increases in thickness half a brick; that the footings project to a distance equal to the thickness of the inclosing wall at its base, and the space inclosed by the footings filled in solid; that the width of the base be at least one-tenth of the height if the shaft is square, and one-twelfth if round or any other shape; that if there is a firebrick lining it must be independent of the thickness of the shaft, and not bonded therewith; and, lastly, that the concrete foundation and the cap be to the satisfaction of the district surveyor. A bay window may now be projected beyond the general line of fronts in a street 40ft. wide and on to the forecourt, if it does not exceed three stories in height above the footway, and does not project more than 3ft. or exceed in width three-fifths of the frontage. It also must not come within 20ft. of the centre of the roadway, or nearer to the party-wall than its projection, and must not be used for trade purposes. Oriel windows must not be less than 10ft. above the footway of the street or project more than 3ft. from the building, or 12in. over the public way; their width must not exceed three-fifths of the frontage, and they must not come within. 4ft. of the centre of the nearest party-wall. The whole must be constructed to the satisfaction of the district surveyor, and if you disagree with him you may go to the superintending architect, whose determination shall be final. It should also be noted that the eaves, barge-boards, and cornices to dwelling-houses need not now be of fireproof material, nor is it necessary that the wooden cornices and barge-boards to dormers, not exceeding 12in. deep, be covered with incombustible material. You have still, however, to get the consent of the Council to any porch, portico, verandah, balustrade, outside landing, or staircase if you desire to construct them of wood. Frames of doors and windows may now come out to the face of an external wall, which will be good news to those who practise in the Queen Anne style. Shop fronts, under Section 73, are not now confined to the ground story, but may extend to the first floor provided the total height does not exceed 25ft. This will create quite a revolution in the appearance of our streets, although Section 55 seems to confine the frames of doors and windows of shops to the ground story. Bressummers, whether bearing upon a party or external wall must have an additional bearing of 4in. upon a sufficient pier of brick or stone or upon a timber or iron story-post, and the district surveyor is to have power in his discretion to require that every bressummer shall have such other story-posts, iron colums, stanchions, or piers of brick and stone or corbels as may be sufficient to carry the superstructure. There is to be a space left between the ends of iron girders to allow for expansion, such space to be equal to ¼in. for every 10ft. of the length. Hearths may now be 6in. thick instead of 7in.

Just a word or two on Part VII., which deals with special and temporary buildings and wooden structures. These cannot be erected without the Council's consent, who may impose certain conditions as to their erection, and limit the time which they may remain; but an open shed, whatever the definition of this may mean, can be erected, not exceeding 16ft. high and 400ft. in area, of any substances and in any manner approved by the district surveyor. This seems to me a most extraordinary clause.

Part VIII., dealing with the rights of building and adjoining owners, contains in Section 87, some very useful provisions which will facilitate the operations of the architect in dealing with walls abutting on neighbouring lands. Where lands of different owners adjoin and are unbuilt on at the line of junction, the following provisions shall have effect:—If you desire to build a party-wall on the line of junction you may serve a notice thereof on your neighbour. If he consent to the building of a party-wall, the wall may be built half on the land of each of you, or in such other position as may be agreed. The expense of building the wall is to be defrayed by you and your neighbour in due proportion, regard being had to the use made and which may be made of the wall by both of you. If your neighbour does not consent to the building of a party-wall, you may not build it otherwise than as an external wall placed wholly on your own land. If, on the other hand, you do not want to build a party-wall but only an external wall up to the boundary of your land, you give notice to your neighbour, and one month after you may proceed with your wall, and project your concrete and footings on to his land, making compensation to him for any damage you may occasion him, and if you cannot agree on the amount, this is to be determined in the manner provided in this section. The only other points to which I wish to draw your attention in this part of the Act is that it provides that a building owner may underpin a party-wall, a point uncertain in the old Act. Also, he has a right to raise a party-fence wall, or to pull the same down and rebuild it as a party-wall. The minimum limit of time in which a building owner may proceed to exercise his rights is reduced to one month in the case of a party-fence wall, and two months in the case of a party-structure or party-wall. The building owner has now, at his own expense, where he lays open any part of the adjoining land or building, to make and maintain for a proper time a proper hoarding and shoring or temporary structure for the protection and security of the adjoining owner. If a building owner serve a party-wall or structure notice on an adjoining owner, it is not available unless the work to which it relates is begun within six months after the service thereof, and prosecuted with due diligence. A fresh provision is contained in Section 93. It is incumbent on the building owner to serve a notice on the adjoining owner if he (the building owner) proposes to build within 10ft. of the adjoining owner's wall, if such building will extend to a lower level than the foundations of the building adjoining, and if the adjoining owner so requires he is to underpin the wall, or, if the building owner thinks it necessary he may underpin it; but he is to be liable to compensate the adjoining owner for any inconvenience, loss, or damage which may result by reason of the work. If the building and adjoining owner disagree as to the necessity for underpinning, the matter is to be settled in the same manner as other differences under this part of the Act. If, after a building owner has rebuilt a wall, and the adjoining owner subsequently wants to use any more of it than he previously enjoyed, he must pay for it.



In Part IX., relating to dangerous and neglected structures, a new provision affecting architects occurs. After the district surveyor has certified a structure to be in a dangerous condition, and the owner dispute the certificate, he may, within seven days from the service of the notice, inform the Council in writing that he requires the matter referred to arbitration. He may then engage his own surveyor to report on the condition of the structure in conjunction with the district surveyor, and if these two cannot agree they are to appoint an arbitrator, or the Court may appoint one for them, and such arbitrator is to make his award within fourteen days. If it is against the district surveyor, the Council pay the costs; if in his support, the owner has to



THICKNESSES OF WALLS UNDER THE LONDON BUILDING ACT, 1894, PART VI.

pay the costs. In the mean time, I suppose the dangerous structure may take care of itself, or promptly fall down.

In Part XIV., the Council take power to make by-laws on the following additional matters:—The dimensions of wooden bressummers, the dimensions of joists of floors, the protection of ironwork used in the construction of buildings from the action of fire, woodwork in external walls, the regulation of lamp-signs or other structures overhanging the public way not being within the city, the means of escape from fire in buildings exceeding 60ft. in height.

Before closing, I must make reference to the Tribunal of Appeal. The number of its members consists of three, one to be appointed by the Secretary of State, one to be appointed by the R.I.B.A., and one to be appointed by the Surveyors' Institution; but no member or officer of the Council is to be on it (but ladies are not excluded), and they are to be appointed for a term of five years, and to be paid. They also may appoint their own clerks, officers, and servants, who shall be paid such salaries as may be determined by the Council. Offices are to be provided, as well as such professional advice and assistance as they may find necessary. These gentlemen will have a busy time, as the following will be some of their duties: to hear appeals as to what is considered the "level of the ground" on a building site, setting back and bringing forward buildings, accuracy of plans of old buildings, laying-out or widening of streets, the superintending architect's decisions on lines of frontage, and which is the front and which is the rear of buildings, open spaces required in rear, height of buildings, construction of public buildings. A point of archæological interest to architects is contained in Section 191. In the event of the destruction, or its being necessary to take down any portion of an old building of architectural or historical interest not in accordance with the rules, it may be restored, by permission of the Council, as originally constructed. One word more as to the exemptions beyond those at present allowed, and they include—Buildings not exceeding in area 30sq.ft. and not exceeding 5ft. high, containing no heating arrangements, and not beyond the frontage line; party fence-walls under 7ft. high; greenhouses, if not attached to other buildings; cases of metal and glass in window openings for plants not projecting over the public way, or more than 12in. from the external wall.

My task is now done. I have intentionally forborne any attempt at criticism, as the time for this ceased when the Bill became an Act, and have contented myself with explaining its provisions. It is for us now to loyally interpret it and carry it out to the best of our ability, and when we have become accustomed to its working, the time may come when we may venture to point out any defects it may contain.

THEATRES.—XLVI.

By Ernest A. E. Woodrow, A.R.I.B.A.

THERE is another aspect from which to look at the necessity of ventilation which I have not yet mentioned, except in quoting Mr. Paul Gerhard's opinions in the last article. I refer to the reduction of the risk of fire in well-ventilated theatres. This is especially advantageous in regard to the stage, where, if not well ventilated, the contents become so hot and dry that they will the more easily ignite. Again, it is well known that the smoke caused by a fire brings about more deaths from asphyxiation than the actual fire itself, and also that the contents of the stage will cause, whatever the construction of the theatre, the first and the most fatal smoke.

The exhaust ventilator over the stage required by all modern authorities therefore serves the purpose of ventilation and as an extract for smoke.

Mr. Frederic R. Farrow, in his Godwin Bursary report, the notes and diagram of which he has kindly placed at my disposal for the purpose of this paper, devotes some short space to describing the methods of ventilating the Opera House, Vienna, where fresh air is supplied to an audience of over 3,000 persons at a minimum rate of 900c.ft. per hour for each person. "The fresh air enters from the garden at the side of the building into the cellar A (Fig. 1), passing through a water-spray shower, which washes it from dust and also cools it for summer use, so that the temperature within the auditorium is frequently in hot weather below that of the external air. From A it is drawn through a circular channel, 7ft. 6in. diameter, by a 10ft. fan B, from which it flows by a rectangular corridor 45sq.ft. in section, and this shortly divides into three channels, the middle one, 32sq.ft. in section, supplying the arena and boxes, the others, 12½sq.ft. each, supplying the galleries. From these channels the air enters the lowest of the three chambers already described as forming an essential feature of Dr. Böhm's system, the cold-air chamber C, and then flows either through the cylindrical tubes D, 3ft. diameter, direct to the uppermost space, the mixing chamber E, or by openings, F, round the tubes to the heating-chamber G, where it is warmed by passing over steam pipes, and then ascends to the mixing chamber E. From the mixing chamber the air enters the auditorium, at the rate of 1ft. per second, through the risers of the seats in the pit and through vertical wall channels to the corridors of the pit boxes and the first and second tier of boxes, and from the corridors enters the boxes themselves through openings in the doors. The upper galleries and boxes are supplied similarly from the lesser channels already mentioned. The area of the openings for the in-streaming fresh warmed air is as follows:—

	Pit	554	square feet.
	Pit passages	28	,,
	Pit boxes	28	,,
	First tier of boxes	28	,,
	Second ,,	28	,,
Same level	Third ,,	14	,,
	First gallery	28	,,
	Second ,,	42	,,
	Total	750	,,

"The foul air from the pit and boxes ascends naturally, assisted by the heat of the central gaselier, and is collected in the great cylindrical tube H, and the foul air from the galleries passes through separate channels I, leading from their ceiling and joining the central tube H, to which also enters a branch channel K from the stage. From the collecting tube H the foul air is expelled at the roof by the fan L.

"In order that this great system may be thoroughly under control, telegraphic thermometers are placed in all parts of the house and communicate with the inspection room M, where the engineer in charge of the ventilation can at once see if the temperature of any part of the house is above the proper standard, and can telegraph his instructions to the engine-room or regulate the supply of fresh air or rate of extraction."

The same system of ventilation is carried out at the Vienna Hofburg Theatre, and as the diagrams (Figs. 2 and 3) for this theatre are more in detail, I include them herewith, trusting they will make more clear to my readers the care and attention given abroad to the methods adopted for making the atmosphere in theatres bearable in winter and summer.

Not long since I was in a place of public entertainment in the provinces where the provisions for ventilation were absolutely nil. There was not even the familiar sun-burner to draw off what vitiated air it could from the ceiling level, not an inlet beyond the entrance doors and not an outlet could I perceive. The air of the auditory became foul very shortly after the performance commenced, and I pitied those in the gallery. Their discomfort was evidently known to the proprietor, for he had endeavoured to overcome the defects left by the architect by placing a *punkah* over the heads of the occupants of the gallery, which was pulled with the energy I have only seen aboard ship or in India and Ceylon. No doubt it was deemed an effectual means of overcoming the evil, and no doubt the proprietor considered the cooling and moving of the air, vitiated as it was by gas, tobacco-smoke, and a crowded audience, an effectual remedy for the architect's omission. Very different, it has been seen, are the means adopted abroad. In Fig. 2 is shown the mode of extracting the foul air in the Hofburg Theatre, A A being the exhaust fan, B B the arrangement of extract shafts influenced by this fan. Fig. 3 gives in fuller detail the section through the cellars, A being the cold air-cellar, B the warm-air cellar, C the mixing cellar, D the floor of the theatre with the various inlet shafts under each seat.

The late Mr. Thomas Verity, in describing the ventilation of the Criterion Theatre—which, as I have said, is in reality the only mechanically-ventilated theatre in London—showed how the air is drawn in by a 4ft. 6in. fan, and forced under the floor of the theatre into a chamber, from which shafts are carried up the walls to admit the air into the different parts of the house. For the extraction of the vitiated air a centre perforation, 5ft. in diameter, is provided in direct communication with a powerful extraction shaft, 4ft. by 3ft., running the entire height of the building. In order to increase the power of this shaft, the waste heat from the grill of the restaurant is carried into it, as well as the products of combustion from the sun-burner. At the gallery level and at the back of the stage other shafts are provided. A special arrangement is also made for carrying off the foul air in flues created by the gas-burners on the stage and at the back of the seats, the latter lights being inclosed.

Efficient ventilation, therefore, we have seen, is a means of saving life, of avoiding illness, often fatal, through breathing vitiated and over-heated air, and is also a great preventive of fire, by keeping substances cool which at a high temperature would the more easily ignite, as well as an influence over fire and smoke by withdrawing the smoke from the audience when a catastrophe does occur. With these points in view, it is well here to see in what way various countries regard the importance of this vital question in their theatre regulations.

Beginning with London, we read that—

> "All parts of such premises shall be properly and sufficiently ventilated in a manner to be approved by the Council.
>
> "All openings for ventilation shall be shown on the plans, and described in the specification, which shall be submitted to the Council for its approval.
>
> "An opening shall be formed in the roof near the back of the stage, of a superficial area at the base of at least $\frac{1}{10}$th of the superficial area of the stage. Such opening shall be covered with a lantern light, glazed on the top and sides, and be fitted with suitable exhaust cowls."

With regard to warming, after prohibiting open fireplaces in the auditorium and stage, and insisting upon protecting fireplaces and stoves, where permitted, by fixed wire-guards, these same regulations continue that—

> "All heating apparatus shall be placed in a position to be approved by the Council, and inclosed upon all sides by brick walls not less than 9in. thick, and shall be properly ventilated.
>
> "All hot-water pipes or coils shall, where necessary, be recessed in the walls, or otherwise arranged so as not to diminish the clear width of the gangways.
>
> "Where such premises are heated by artificial means, the high-pressure hot-water system with sealed pipes will be inadmissible, and either hot-air or the low-pressure hot-water circulation system shall be adopted, having an open cold-water supply cistern, and the pipes throughout the system shall be of galvanised wrought iron, with the exception of those in immediate contact with the boiler, which may be either of galvanised wrought iron or copper.
>
> "The boiler shall be made of wrought iron, copper, or mild steel, and shall be provided with a dead weight or other approved safety-valve, which must be attached to the boiler by an independent galvanised wrought iron or copper pipe, and must not, under any circumstances, be fixed to the circulating pipes, and must be placed in such a position as will insure protection from soot and dirt.
>
> "The term 'low-pressure' shall be understood to mean the pressure due to the vertical head of water between the boiler and the supply cistern."

In Austria a definite quantity of fresh air per hour is specified as compulsory, and on days when two performances are given there must be an interval of at least two hours and a half between the performances. In these days, when so many places of entertainment in London give two shows in one evening—one about 6.30 and one about 9 o'clock—such a rule as this would greatly interfere with the management, but would, on the other hand, greatly improve the conditions under which the second audience have to witness the performance.

The roof over the auditorium of a Brussels theatre must have openings at least equal in area to that of the opening over the sun-burner (*lunette du lustre*), and the openings must be only closed in such a manner as to permit their being easily opened from some accessible portion of the building to carry off any smoke which may penetrate by accident into the building in the event of fire occurring on the stage.

Paragraph 27 of the new police regulations

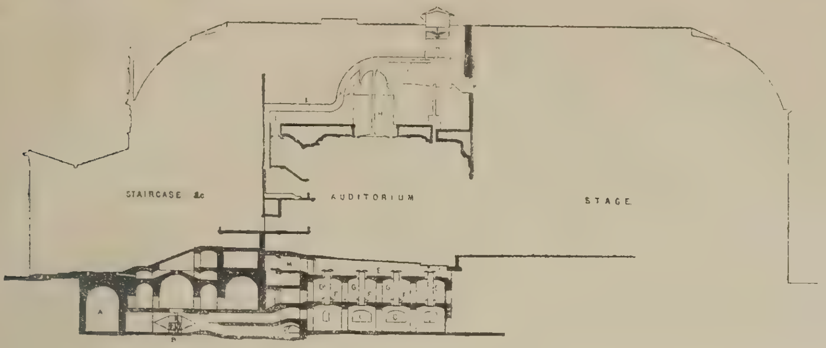


Fig. 1.

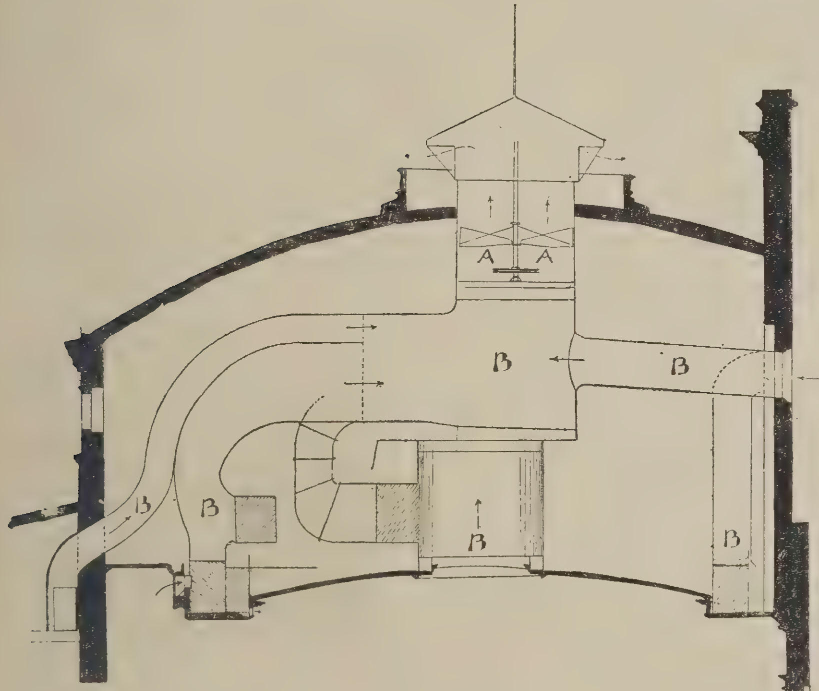

Fig. 2.

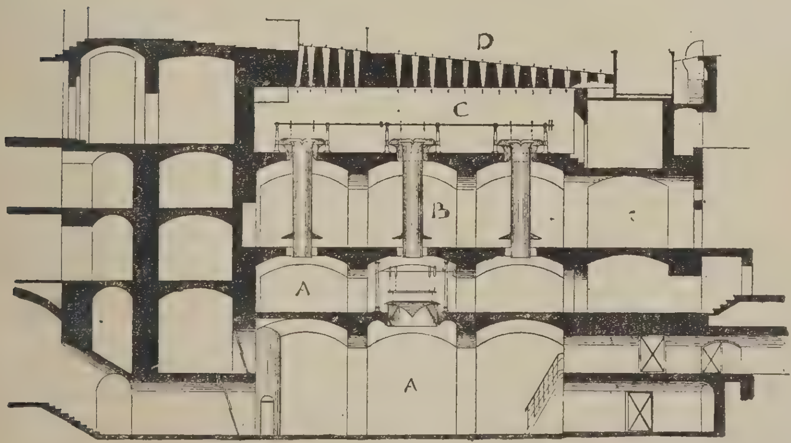

Fig. 3.

relating to German cities enforces that the auditorium and the stage, with its adjoining rooms, shall be heated by one central system, the heating-chamber for this being contained in solid walls, completely isolated and approached only from the outside, and not through the building. All the ducts or conduits for hot air, pipes or coils for steam, shall be surrounded by fireproof materials, and be so constructed so as to be easily cleaned. All hot-air ducts or gratings and steam pipes or radiators shall be 25 centimètres away from any inflammable material. Hot-air gratings shall have flaps of incombustible material to prevent the transit of smoke in case of fire. In a few exceptional cases rooms distant from the stage may be heated by tiled stoves, if adequate precautions are taken in their erection and position of their flues. No heating apparatus is allowed in the store-rooms.

Paragraph 28 of the same rules deals with the ventilating ducts, and specially provides that they be arranged so as to prevent the spread of fire. Ventilators must be placed over the stage near the ridge of the roof, and constructed so that they can be opened by a single movement, the apparatus for working them being in such a position of safety as to allow the person working it to be sheltered from all possible danger. The area of the ventilator over the stage must be at least five per cent. of the superficial area of the stage itself.

The same paragraph details the requirements for the ventilators over the auditorium. An exhaust ventilator is compulsory, the inlets to which must be at least one mètre above the level of the ceiling of the topmost gallery, and the area of the ventilator at least three per cent. of the superficial area of the auditorium. The opening of these ventilators must be from a "safe" position. Note this: All staircases and passages must be adequately ventilated. This is a most important provision, as staircases and passages have been often the scenes of asphyxiation.

The ventilation and warming of dressing-rooms, where actors spend so much time, must not be overlooked. There should never be a dressing-room without an external window.

I cannot conclude this chapter without some reference to the sliding-roof so common now over the auditorium of music-halls. Even where these cannot be opened during a performance, they play an important part in purifying the atmosphere during the daytime, and rendering the hall more fit for occupation the following evening.

There is one favourite method of warming often introduced where no permanent provision has been made. I refer to gas-stoves. These are too frequently placed where no flue can take off the products of combustion; they certainly warm the air somewhat, but they also vitiate it. There is also a danger in gas-stoves, in places of public resort, from fire; they are sometimes only connected with the supply by a length of indiarubber tubing, and placed in positions where they can be easily overturned. Where used, there should always be a flue, and they should never be placed where there is any risk of their being pushed over in the case of a rush.

"BUILDING NEWS" DESIGNING CLUB.

A MOORLAND CHURCH WITH SUNDAY SCHOOL ATTACHED.

THE work for the new session of our long established Club has opened well, if we may judge by the numerical response with which the first competition of the present series has been favoured, and on the whole it is abundantly clear that the merit of the majority of plans contributed is equal to, even if it does not surpass, that of previous years. None quite realise, however, the exact kind of building which we had in view, and not a few of the designers have obliged us to set their proposals on one side, because of their unduly ambitious character, with even florid detail in some cases; in others much too magnificent a scheme has been adopted, while a general lack of simplicity is conspicuous in nearly all of them. Here are the instructions issued for the use of the competitors:—A Moorland church, with a Sunday school-room attached, and a shelter adjoining for carriages. The church to seat 200 persons, including two priests' desks and choir-stalls for six men and eight boys in chancel. Provide a commodious vestry, with a fireplace in it, and provision must be made to protect the entrances, as the site is an exposed one. The land on the mountain side falls from west to east 1 in 14, and from north to south rather more than 1 in 8 in irregular contours. The chancel is to be furnished with an organ, and be arranged properly, with altar pace seven steps above level of nave, two steps being at entrance to choir, where there is to be placed a simple rood-screen in oak on a stone base. No aisles to nave, but a small tower with spire. A covered way is to connect the Sunday school-room with the church. This room to be available for parish meetings, and to measure 45ft. by 22ft. inside, or be of that area. The shelter is to be suitable for carts and carriages standing during service for the use of those driving to the church. The difference of level in the site may permit of the shelter being continued under the school, if desired. Stone and slate to be the material used, and the design is to be simple in detail, with solid and sturdy proportions. Scale 8ft. to the inch. Plans, two elevations, and view. The plans may be drawn to 16ft. to the inch if necessary; but they must show the seating arrangements intended."

We have placed "Sphinx" first, "Ictinus II." second, and "Red Rose" third. The remainder rank in the order in which we have referred to them in the following brief review. "Sphinx" does not exhibit much originality, and his plan is even ordinary, and marked by faults which we have not overlooked. The flat sprawling arch to the covered way between the school and the church is actually ugly, and an inclosed stable under a school is not conducive to health. An open shelter is a different matter, and we did not exactly ask for a stall-stable. However, it would, of course, be useful. The chancel has an organ recess, but there is no attempt at contriving a way for returning communicants. In so small a church perhaps the convenience is scarcely necessary. The pulpit is badly placed, as it would be very much in the way of the priests' stall on the north of the choir, and quite hide him from the view of those in front of it. The simplicity of the building generally is its chief recommendation; but beyond this, in an architectural sense, there is not much more to be said. It would be suitable, and seems to be in harmony with a moorside site, besides which the scheme is within the limits of available funds usually forthcoming for undertakings of this kind. "Ictinus II." takes precedence for much the same reasons; but the position of the vestry in his plan is a mistake, and the external passages beyond the nave seats are not wanted. The roof over the baptistery may be thought to give quaintness. It hardly enhances the design, and certainly does not add to its dignity. The belfry stage is not attractive, and the tower cutting off the vestry from the chancel is a great objection. Located south of the chancel on the other side of the tower, as in the first design, it would have been far better. The grouping has a good effect, and the school being isolated is a considerable advantage. The tower space on plan is wasted, as it is needlessly large for a mere passage way. "Red Rose" exhibits a closer knowledge of Gothic work than either of the designers placed before him, and his design is excellent in many respects; but we cannot overlook its unsuitability for an ordinary moorside site, where funds are limited, and its chance of erection would be out of the question in consequence. The scheme seems better adapted to a larger church; but we commend the arrangements in detail with this proviso. The returning ways from the sanctuary are well managed, with the organ on the south side, though the way up to it seems hardly clear. We suppose it is in the lobby. The priests' prayer-pews are a little out of sight behind the lectern and pulpit. The open gallery way from the school to the western porch is quaint enough, but very expensive, running through the buttresses and built on arches. After all, it has no roof. The entrance is well screened by the outer lobby, and the baptistery looks well; but we can hardly say we think the treatment of the spire at the west end a success. We shall hope to see more of "Red Rose" in our Club work this session. "Myst," too, is a clever draughtsman—in fact, his design shows a considerable amount of skill; but the American-cum-Spanish big archway entrance to the tower dwarfs the whole composition. The plan has some good features, and is arranged with an eye to the services of the church, though the length of the sanctuary is hardly justified. "Myst" has much to learn in respect to the relative value of space and void in realising the beauty of proportion. His roof inside, and screen and pulpit are shockingly poor. "Heather" is meagre in his detail, even to the verge of the commonplace, so anxious is he to err on what is called the "safe" side. The seating in the tower, after the fashion of a quasi-transept, and the miserable little organ-chamber, are both faults of importance. The porch to the school covered way repeats meaninglessly, and almost to the same scale, the design of the main entrance to the church, and both are spiritless in design. The general grouping of the buildings is effective, and the raised terrace area, bringing the doorways conveniently to one level, is a good feature, and the treatment has the merit of simplicity. "Chichevache" draws with a thin weak line, with a tendency to scribble. His detail seems to suggest that he has been in a "good office," as the term goes; but he must be more careful, and has much to learn. The springing of his arches are items in point. His perspective is poor, and the general arrangement of his sheet lacks contrivance. We shall expect better things than this from "Chichevache." "Manetho" is another contributor who ought to improve. His plan is well suited for the object in view, but he has a little overdone the tower. The square window in the base of the tower for the vestry ill accords with its elevation, which otherwise, as seen from the east, is rather effective. The key-stones to the gable tops are ugly, and the trumpery dormers to the nave-roof would be best omitted. "Floreat Sherringham" has much deserving of our praise, and his group, with its quaint little cloister garth is the work of an artistic mind, and so is one which we are not likely to overlook. The idea which would at once suggest itself to the stranger on going along the moorside pass would be that a small monastic establishment had been built by contemporary piety, for Mediæval origin would hardly be suspected, so up-to-date is the design. The great west tower would render its realisation impossible in the ordinary way, and, indeed, is too ambitious. The whole thing wants to be really larger for the lines adopted by the author; therefore we cannot award him a higher place on this occasion. His detail is harshly drawn and poor.

It is not easy to precisely classify the designs which follow, they are so equal in their degree of merit, and yet so varied in exactitude of style and method. Some of the plans have the good point of contriving the approach to the school from the west end of the church, so that the pupils can be brought into the nave without noise or needless disturbance. Both the plans illustrated render it obvious that the children must either go out into the open air, or pass into the church near the chancel, and so on into their places. Whether scholars should not occupy the front seats in church instead of the back rows is a point upon which churchwardens differ; but such a prominent position has many advantages which are mostly overlooked. In any case, however, it would be best to bring them in from the west end. "Minstrel" does this, but by making his plan take the shape of the letter E, the grouping fails in effectiveness, though the detail of his work is unassuming and picturesque. "Just My Luck" is very careful, and takes pains to avoid extravagance; but in this determination he has failed to invest his design with an appropriate feeling and character suited to the site. The stone broached spire thus handled seems devoid of scale, and really looks like a bigger example done in miniature. A small tower and spire ought to look its size, and be designed with some reference to its scale. "Birmingham" makes his tower too much like a Chinese one, with its curved leaded roof. The schoolroom and shelter are plain and domestic-looking; but the church itself is rather nondescript. "The Stormfiend" sends a peaceful-looking design, the best part of which is the end elevation of the schoolroom. The church tower has a good, sturdy ringing stage; but the belfry and parapet cannot be described as successful. The drawings are crisply delineated, though the view might be better. "Red Lion" sends no view. He is too fond of canted bays and fanciful items of detail: otherwise this design is by no means poor, if we are not able to say exactly that it is really good. A less ambitious attempt is made by "Wykehamica" in a regulation Lancet sort of style which in reality would work out very well. With a more keen sense for proportion, this design might be considerably improved without any serious departure from its present lines. It suffers from poor, spiritless draughtmanship. "William of Sens," in a very modern mode, adopts French features, and boldly goes in for a central tower and spire of costly and sturdy proportions. His design is neatly set forth; but we do not really like it—apses and spirelets bristling up the skyline. "Pal," on the dear old village-church lines, follows a much safer and more worthy type of work; but his square-headed windows are needlessly severe and so low down in the flanks of the building. The only connection with the church from the schoolroom is through the vestry and the chancel. This is fatal, as even if the pupils need not go that way, others must, and the sanctuary in no case should form part of a thoroughfare. "Phœnix" sends a striking and broadly-treated church with a central tower, which would look well among the mountains. He makes the same mistake as "Pal" in his plan, however, and, besides that, the design is too elaborate for the purpose. The unity of the general lines of the composition well merit commendation. "Midnight-oil" does not do his design justice, and the flatly-proportioned gables are crude without quaintness. The tower and spire, with the turret and steps leading up to the entrance, combine to make an exceedingly pretty and well-managed piece of design. The drawings are scrappy, and excessively poor. "Cyclist" sends a tower which is enough to spoil whatever chance he might otherwise have relied on, though we are unable to approve of his plan with the choir-vestry on the one side of the chancel, and the priests' vestry on the other. His perspective transposes entirely the arrangement of the building as shown by the geometrical drawings. Possibly it is intended as an alternative? "Ivy" comes next, and then "Tamar," whose rounded piers and reveals would be better adapted to brick construction. The plan is poor. "South Devon" is not churchy enough, and shows his work so indifferently that we can hardly see what he means. "Albyn" is a more serious worker, though he has by no means realised the problem. His central tower is spoiled by its spire and overdone upper stage, which is far from beautiful. "Do Do" is simple, but his design is unworthy of its purpose. "Nyoola" has planned a barn-like interior, more like a meeting-house. "Jupiter" in a general way suggests a sense for picturesqueness; but on closer inspection both his drawings display ignorance of planning and paltry detail. "Kelly's" church inside would be baldness untempered with the grace of proportion, and externally it has little claim upon one's sense of fitness. "Sesame" is a trifle more effective, but, like "Pal," he contrives a way through the choir to reach the school. "'Ampshire 'Og" drops the essential letter H. Let him also drop curved lines for parapets and gables, if he cannot manage them better than he has done in this instance. His windows are more than ugly—they are vile; nothing could be worse than the pair at the end of the schoolroom. "Ageepee" seats his nave wrongly with passages round all the benches. His perspective is the best part of his set of drawings. "Esto Quod Es" is the motto of the next design, and then comes "Quaigh," who spoils his chance of a better place by cutting off the vestry, and bringing the way to the school through the chancel. His drawings in themselves are rather good. "Nestor" furnishes his fabric with a central tower spanning the chancel, while "Inkerman" does the same, reckless of cost, and not thinking much of so mundane a consideration as suitability. The vestries are too clever by half. "Kirk" has little idea of what a church should be like. "Raven" has drawn a very effective looking western tower and spire, though its perspective hardly accords with its plan. The arrangement of this design is poor. "1 2 3" in a circle ranks next, and then "Artifex" odd beyond compare, and "Xedra" with flying buttresses and a florid screen. "May" might be better, and if he wants to know how—by providing better foundations for a big central tower. "Flute's" design is ornate enough for anything, and as ill-fitted as it can be for the site intended; the plan is not so bad. "Lux" has an odd notion of tower design, and little knowledge of church architecture. The other designs may rank as follows:—"Triagane," "Fronté," "Pallene," "Maori," "Lux" (Scarborough), "Petrel," "1894," "Creon," "Ledis," "Gryph," "Stabilitas," "Yill," "Flash in the Pan," "Leonidas," "Tim," "Sparks," "Victor," "Norvic," "Yum Yum" (stalls under the sanctuary is anything but a nice idea, though it may be "Yum Yum's"), and "Waverley."

CHIPS.

Princess Christian will lay the foundation stone of a new church-room for St. Matthew's, Bayswater, on Friday, the 28th inst.

At a meeting of the shareholders in the Lancashire, Derbyshire, and East Coast Railway, it was reported that the works were rapidly progressing, and that the contract has been let of the section from Tuxford to Lincoln.

A meeting of the Architectural Section of the Philosophical Society of Glasgow, was held on Monday evening, when Mr. Thomas Gildard, architect, read a paper entitled, "An Old Glasgow Architect on Some Older Ones."

Dr. G. Danford Thomas held an inquest on Tuesday, in St. Pancras, on the body of Herbert Richard Tatton, aged 27 years, an architect's clerk, lately residing at 38, George-street, Portman-square, who was discovered in a dying condition in a cell at the Hunter-street Police-station on Friday. The jury returned a verdict that the deceased died from syncope when suffering from coma, and the effects following an attack of delirium tremens and chronic habits of intemperance.

It was reported to the City Commissioners of Sewers on Tuesday, that for the erection of the new offices of the Commission, in Basinghall-street, the Finance Committee had accepted the tender of Messrs. J. Chessum and Sons, at £32,266, that being the lowest. This was approved. The same committee submitted specifications for the construction of sewers, subways, vaults, &c., in the new thoroughfare from Bishopsgate-street to Middlesex-street, estimated to cost about £13,500, and it was referred to them to advertise for tenders and carry out the works.

Our Illustrations.

"THE ENTOMBMENT," BY RAPHAEL.

This magnificent altar-piece was painted in 1507 for the Church of St. Francesco, at Perugia, and was divided into two groups. It is now in the Borghese Gallery at Rome. On the left the body of the Saviour is borne to the grave by two men with great energy of action. Close to the body are Mary Magdalen, Joseph of Arimathea, and John, variously expressing the deepest sympathy. On the right, supported by women, is the Blessed Virgin Mary, fainting. "This," says Kugler, "is the first of Raphael's compositions in which an historical subject is dramatically treated, and, as is evident from the number of designs and studies he made for the picture, it tasked his powers to the utmost. This work has been the subject of criticism by Rumohr and others, who ascribe to it flatness of execution and want of real pathos; and accuse Raphael of having borrowed parts of the composition from Mantegna's grand etching of the Entombment, and from Michael Angelo's group of the Pietà; from all of which we entirely dissent. The execution of the picture is severe and careful, but extremely beautiful; the action true and powerful, the expression of the single heads as fine as anything that issued from the master's hand; while the modelling of the Saviour's body—the work of a painter only twenty-four years of age—may take its place among the master-works of Christian art." The lunette, now placed above an altar-piece of the Birth of Christ, by Oranzio Alfani, in the Church of St. Francesco de Conventuali, at Perugia, represents the First Person of the Trinity surrounded by angels, with upraised hands in benediction. The Vatican possesses three compartments of the predella, containing allegorical figures in chiaroscuro, illustrative of Faith, Hope, and Charity, on a greenish ground, accompanied by two boy angels or genii, in circular medallions, treated with grace in a light and spirited manner, very pleasingly composed. Crowe and Cavalcaselle's "Life of Raphael" may be mentioned as containing many interesting particulars of his masterpieces, including the "Ansidei Raphael," so called from the family for which it was painted, and now in the National Gallery, having been bought from Blenheim in 1885 by the Government for no less a sum than £72,000, the largest price ever paid for a single picture.

RESIDENCE FOR THE RT. HON. SIR E. MALET, AT MONACO.

This residence, which is now nearing completion, is situated on the Cap d'Aglio, above Monaco, on a well-selected site, commanding magnificent views over the Mediterranean, the Rock of Monaco, and Monte Carlo, with Cap Martin in the distance. Externally it is designed in a free French Renaissance, but internally it is Rococo, *pur et simple.* The magnificent central hall is beautifully decorated by a French artist, the ceiling being founded on the ceiling at Würzburg, by Tiepolo. Sir E. Malet's splendid collection of art treasures will eventually be placed in this hall, which, on account of its good proportions and being well lighted, is admirably adapted for this purpose. All the rooms will have the comfort of open fireplaces, besides a system of heating throughout the whole mansion, carried out by Mr. J. Grundy, of Duncan-terrace, Islington. The contractor for the work is M. Marquet, of Nice, and he has had the assistance of Mr. Tersling, of Mentone, during the progress of the works, who has been superintending personally on behalf of the architects, Messrs. Giles, Gough, and Trollope, of London. The drawing, which we thus illustrate, was shown at the Royal Academy this year.

A PAIR OF COTTAGES AT RUDGWICK, SUSSEX.

These cottages are erected as a lodge at the entrance gates of a house belonging to Mr. Frederick Barker at Rudgwick, near to Horsham. They are built in red bricks, and are roofed with dark red Broseley tiles. The builder was Mr. F. T. Chinchen, of Kensal Green. The architect is Mr. W. H. Harrison, F.R.I.B.A., of 66, Victoria-street, S.W.

"BUILDING NEWS" DESIGNING CLUB: A MOORLAND CHURCH AND SUNDAY SCHOOLS.

(See description on page 781.)

1A, TOTTENHAM COURT-ROAD.

This building has lately been erected for the executors of the late Mr. J. Henderson. It has a bold front executed in red Mansfield stone, and red bricks surmounted with a cupola for electric light. The ground floor consists of two shops, the upper floors being planned to be let as flats or for showrooms. The total cost was between £6,000 and £7,000. Messrs. Wigg, Oliver, and Hudson, of 7, Bedford-row, W.C., and 80, Leman-street, E., were the architects, Mr. Walter Gladding, of 203, Whitechapel-road, E., being the builder.

COMPETITIONS.

The Paris Exhibition of 1900.—From Monday to Wednesday next plans for the construction of the forthcoming exhibition will be deposited by various competitors at the Palais de l'Industrie. Already 660 have been announced. The jury who will pronounce upon them will consist of 31 members, with M. Barthou, formerly Minister of Public Instruction, as their president. Ten jurymen will be elected by the competitors themselves. M. Casimir Périer will inspect the plans on Tuesday next, and the best 18 will receive prizes varying from 6,000fr. to 1,000fr.

CHIPS.

A monument to the celebrated chemist, Eilhard Mitscherlich, was unveiled on Sunday in the Chestnut Grove behind the University of Berlin.

Buff bricks and terracotta have been used, the *Canadian Architect* states, in quite a number of the larger buildings erected within the last year or two, and now under way, in Toronto and Montreal.

The Duchess of Albany visited Kingston-on-Thames on Monday, and formally opened the new home of the Kingston Nursing Association, which has been erected in Birkenhead-avenue, at a cost of £900.

Mr. S. Young, Master of the Barbers' Company, has presented to the City Corporation a portrait of Sir W. Grant, Master of the Rolls, which was painted by Sir T. Lawrence, P.R.A., in 1802, and exhibited at the Royal Academy. The picture has been accepted for the City Art Gallery.

A hall for the Manchester Unity Order of Oddfellows has just been completed in Castlereagh-street, Sydney. On account of the depressed state of trade in Sydney, the sum of between £6,000 and £7,000 has been spent on what would have cost £10,000 five years ago. The exterior is of Classic design. The large hall on the ground floor holds 1,500 persons, and there is a smaller hall on the first floor, in which 300 persons could be accommodated, and over this is the lodge room of the Order. The architect is Mr. John Porter, and the contractor Mr. W. J. Coleman, both of Sydney.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Birmingham Master Builders' Association.—The annual meeting of this Association was held on Friday, at 17 and 19, Colmore-row, Birmingham. Mr. T. Barnsley presided; and there were also present Messrs. R. Bulley, T. Surman, W. Sapcote, J. S. Surman, J. Goodman, T. Johnson, J. Jeffrey, F. G. Whittall, R. Fenwick, E. Bates, A. S. Smith, J. Archer, and E. J. Bigwood, secretary. The report of the committee stated that the depression of trade referred to in the last annual report continued; but the progress of several large works in the city—notably, the new General Hospital, the Technical Schools, and the railway extensions—had provided a fair amount of work for the operatives in several branches of the trade. The year had been an uneventful one, no matter of importance having disturbed the amicable relations existing between employers and employed. The number of members of the association was 65. The balance sheet showed total receipts for the year, £124 10s. 2d., which, with the balance from last year, £28 13s. 11d., made a total of £153 4s. 1d.; and the various disbursements, including the secretary's salary, to £88 12s. 5d., leaving a sum of £64 11s. 8d. to the credit of the association. On the motion of the chairman, seconded by Mr. Bulley, the report and statement of accounts were approved. Mr. Barnsley was unanimously re-elected president, Messrs. T. Rowbotham and R. Bulley were re-elected vice-presidents, Mr. G. Twigg, treasurer, and Mr. Bigwood secretary.

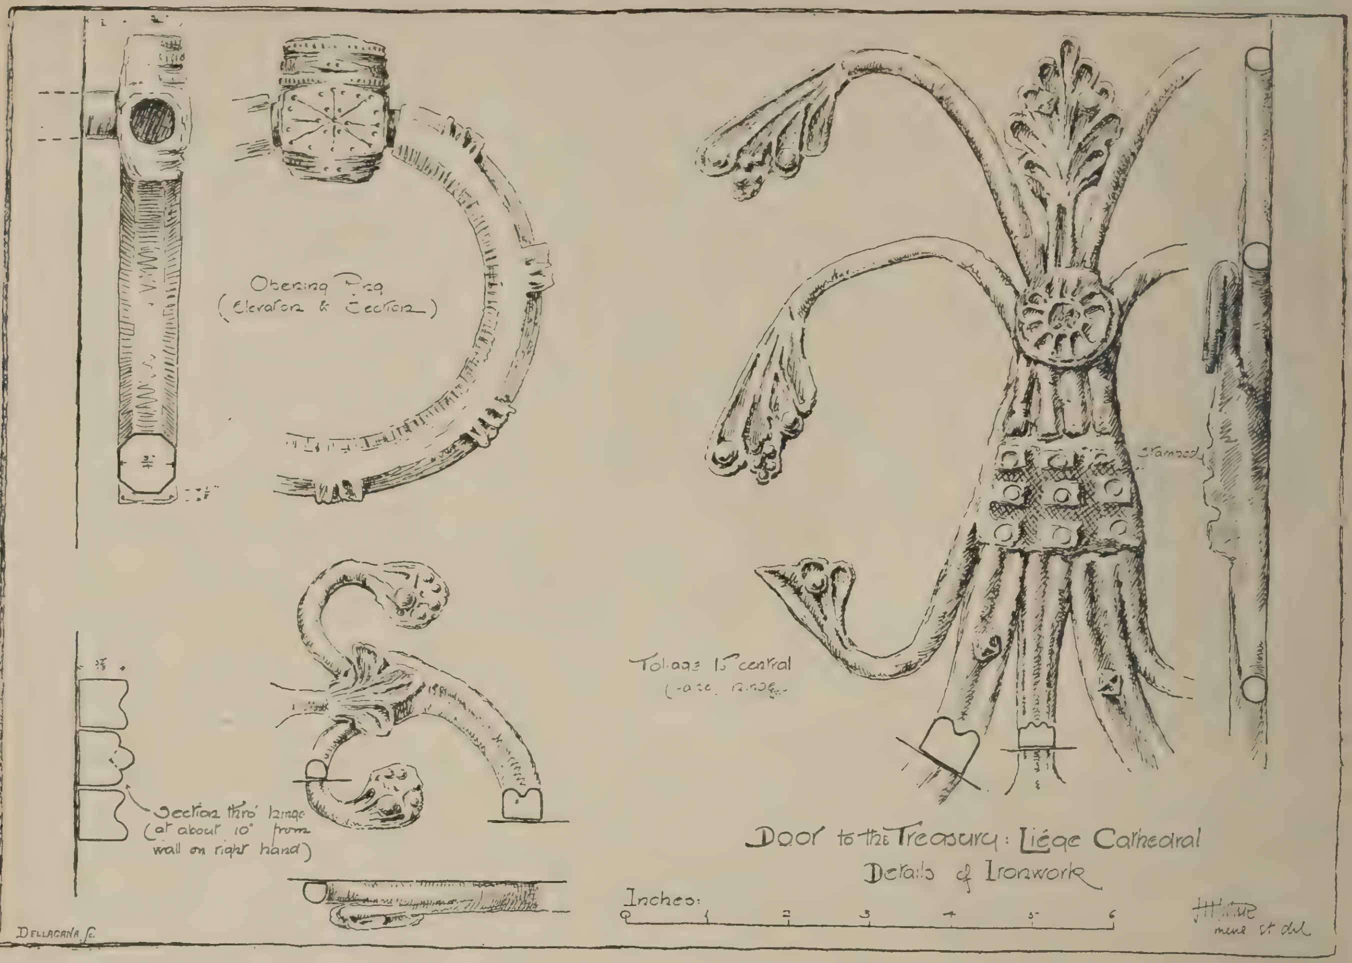
Glasgow Architectural Association.—The general monthly meeting was held in the rooms, 114, West Campbell-street, on Tuesday evening, the president, Mr. A. N. Paterson, in the chair, when Mr. Charles J. Davidson read a paper on "The Planning of Farmhouses," being a continuation of the series of essays on planning contributed by members. Dividing the subject into three classes—sheep-farms, dairy-farms, and stock-rearing farms, the different requirements of each were explained in great detail. Treating of the architectural appearance of farmhouses, Mr. Davidson said that in some cases the whole steading can be arranged symmetrically; and where this is not attainable, the extended lines of buildings, the varying outline caused by the different heights, and the numerous gables, seldom fail to give a certain degree of piquancy and picturesqueness. The paper was illustrated throughout by reference to a number of plans and diagrams hung upon the walls.

Institution of Civil Engineers: Association of Birmingham Students.—A meeting of the above was held on Thursday last at the Midland Institute, Birmingham, when an interesting paper on "Graphic Statics" was read by Mr. H. C. Adams, Stud.Inst.C.E., and hon. sec. of the Association, the president, Mr. Robert Godfrey, A.M.I.C.E., in the chair. After showing a comparison of five different ways of determining the stresses in a simple roof truss, Mr. Adams worked out diagrams showing the alteration made in the stresses in the roof by the action of the wind, and showed a very useful comparison of the formulæ for wind pressure on inclined surfaces in general use. Calculations of the stresses in a plate girder under three different loads were made, showing how the stresses from the various loads were combined in one figure. A short discussion on the paper followed. Professor R. H. Smith, of Mason College, made some useful remarks on the paper, and described some experiments he had made with regard to the loads on supports in the case of continous girders. He also commented on the stresses in a solid structure, taking the wind into account. The discussion was continued by the President, Mr. Twinberrow, and others. A vote of thanks to Mr. Adams concluded the proceedings.

* * *

A picture entitled "Eve and the Voices," by Mr. Robert Fowler, R.I., has been recommended for purchase by the arts committee of the Liverpool City Council as an addition to the permanent collection in the Walker Art Gallery. It is now hung in the autumn art exhibition at Liverpool, the catalogue price being £450.

The East Ham School Board, at their last meeting appointed Mr. R. L. Curtis as their architect for a new school to accommodate 2,000 children, to be built in Red Post-lane, and also accepted the tender of Mr. G. Sharp, of Stratford, at £5,090, for enlarging the schools in High-street in accordance with Mr. Curtis's designs.



IRONWORK OF DOOR TO THE TREASURY, LIEGE CATHEDRAL.

THE sketches herewith reproduced were drawn to full size on the spot by Mr. H. Hillier, of Trowbridge, to whom we are indebted for their loan. The entire door will be found fully illustrated in the Building News for June 9, 1893, giving the general design of this magnificent specimen of 13th-century wrought-iron work. Its crisp and delicate refinement is, perhaps, the leading characteristic of this fine example, and the detail delineations of some of its parts can but be useful for reference by those engaged in work of this kind. Every scroll and foliation differs somewhat from the other, no two being exactly alike, thus contrasting with the mechanical uniformity which mars so much of our modern metal work. A description of this doorway in the cloisters of Liège Cathedral is given in "Histoire de l'Eglise Collegiate de Saint Paul actuellement Cathedral de Liège," by Prebendary O. J. Thimister.

BUILDERS' BENEVOLENT INSTITUTION.

ELECTION OF PENSIONERS.

THE election of two pensioners on the funds of this charity took place on Thursday, Nov. 29, at the offices of the Institution, 35. Southampton-row, Bloomsbury-square. Mr. Basil P. Ellis, president, occupied the chair, and amongst other friends of the Institution, there were present Mr. Geo. Plucknett, J.P. (treasurer), Mr. C. Bussell, Mr. J. T. Bolding, Mr. T. Stirling, Mr. T. Stirling, jun., Mr. T. F. Rider, Mr. C. B. New, Mr. R. Perkins, and Mr. J. W. Scrivener. There were two vacancies for pensions—viz., for one man and one woman—there being one male and seven female applicants.

At the close of the poll, the scrutineers (Messrs. T. Stirling and T. F. Rider) announced the result, which was as follows:—Jack Taylor, Bermondsey, aged 62, master slater, 1,356 votes; Sarah Elizabeth Drake, Tylers' and Bricklayers' Almshouses, Ball's Pond, aged 64, widow of Francis Drake, builder (seventh application), 3,273 votes; Mary Ann Healing, Curtain-road, aged 64, widow of Samuel Healing, builder (fifth application), 590 votes; Maria Elizabeth Powell, Camberwell, aged 61, widow of G. T. Powell, late a pensioner (second application), 1,976 votes; Mary Anne Bowley, Tylers' Cottages, Ball's Pond, aged 67, widow of H. R. Powell, late a pensioner (first application), 569 votes; Eliza Ellis, James-street, W., aged 75, widow of E. G. Ellis, builder (first application), 1,126 votes; and Ellen Batchelder, Carshalton, aged 61, widow of Chas. Batchelder, builder (first application), 580 votes. The successful candidates were, therefore, Jack Taylor and Sarah Elizabeth Drake.

Votes of thanks were passed to the chairman and the scrutineers, and the proceedings terminated.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE third meeting of the Institute for the present session was held on Monday evening, Mr. F. C. Penrose, F.R.S., occupying the chair. Mr. W. D. Caröe, M.A., F.S.A., opened a discussion on the question as to "what steps can be taken to restore a proper appreciation of the statutory examination for certificates of competency to act as a district surveyor in London." Mr. Caröe referred to the difficulty which must ensue from the declaration demanded by the London County Council from candidates for the offices of district surveyors that they will devote all their time to the business of the Council, and that they will take no part in any private business. In the nine elections before the declaration was demanded the candidates were 72, and the passes 31, while in the elections since the numbers were respectively 25 to 10, and some expert witnesses before a Parliamentary Committee held that these later candidates were not of the same status as before. While deprecating any idea of conflict with the London County Council, Mr. Caröe held that it would be impossible to get the best class of professional men to act unless they were allowed to carry on their own business, but suggested that perhaps the difficulty might be met by a district surveyor being allowed to act as a practising architect, except in his own district. Mr. Caröe concluded by moving a resolution that "this meeting is most desirous of seeing the high status of district surveyors maintained, especially having regard to the increased responsibilities placed upon them by recent legislation." This resolution was seconded by Professor T. Roger Smith, district surveyor for West Wandsworth, who strongly insisted, from his own experience during nearly twenty years, upon the necessities of district surveyors being qualified architects. A discussion ensued, in the course of which it was stated that the declaration demanded had in many cases reduced the district surveyor's income 60 or 70 per cent.; but at the same time a hope was expressed that the members of the Institute should do their best to act with, and not against, the County Council, and a belief was set forth that the County Council could only be anxious to secure the best men to carry out these important offices, and that if the present declaration were proved to be a mistake, it might be withdrawn. Mr. Caröe's resolution was eventually put, with the addition of the words "by permitting them to practise privately, as heretofore, under such restrictions as may be considered necessary," and carried unanimously.

A joint meeting of the Newcastle-on-Tyne town improvement and sanitary committees was held on Friday to consider a report dealing with the question of building one-roomed tenemented dwellings on Miller's Hill. It was found that the stipulations made by the Local Government Board were such that the scheme would become entirely unremunerative, and therefore it was unanimously decided to report to the council accordingly, and recommend that the scheme be abandoned.

On Wednesday week the dedication of the new nave and aisles of the parish church of St. Mary, Plaistow, was performed by the Archdeacon of Essex. The first portion of this work was completed about four years ago, when a new chancel was added to the old nave. Further accommodation was found necessary, and there is now seating accommodation for about 1,000 persons, as against 400 or 500 in the old building. The cost of new edifice, including the chancel, was £11,500. The new nave is 44ft. wide, and consists of four bays.

In regard to the contracts sent to Tasmania from London for paving blocks, twelve sawmills will, the *Australasian Builder* states, begin work immediately with 300 men. After Christmas more mill-owners see three months' work ahead. The millers are co-operating harmoniously, and they are determined to sink trade differences in order to insure success. The quantity of blocks required for a shipment will be allotted amongst the mills now working.

WAYSIDE NOTES.

I have received the first number of the new magazine called *The Quest*, printed at the Press of the Birmingham Guild of Handicraft, and published by Messrs. Cornish Bros., of New-street, Birmingham, and Messrs. Simpkin, Marshall, and Co., of London. *The Quest* is to be issued three times a year, in November, March, and July, and the price is half-a-crown a number. Presumably the spirit of the enterprise is to be gathered from the opening poem on "The Quest of the Soul's Desire."

> "He follows her for ever, leaving all,
> Led on by sudden glimpses of her face,
> Each fairer than the last, and with a grace
> Of welcome, and sweet lips that seem to call;
> But weary is the knight who is her thrall,
> And well for him that Love is there to brace
> His strength, and will not let him slack his pace,
> Nor stay to take the apples as they fall.
> And though he never win this shadowy Best,
> Winning or losing, it is his to live
> For ever weary in a noble quest,
> With hope throned high and pleasure fugitive,
> And not to linger in an unearned rest,
> Tasting the soulless sweets the world can give."

The accompanying frontispiece, by Ernest G. Treglown, is fairly well done, and the description of the Grange at Broadway, near Pershore, by J. R. Holliday, illustrated by sketches by Edmund H. New, is interesting. There is also a ballad taken from the "Scottish Minstrel," decorated by Henry A. Payne, and an essay on "The Platonic Theory of Art," by Professor E. A. Sonnenschein. The larger portion of the magazine is occupied by "The Life of St. Silvester," as it is told in the "Golden Legend" of William Caxton, with illustrations and head and tail pieces by Charles M. Gere, Ernest C. Treglown, and G. T. Tarling. The paper is good, and the type reasonably so. The advertisements, illustrations, and all, are in keeping with the general character of the magazine, and the whole is very creditably produced. I hope *The Quest* may prosper—perhaps it is only envy and uncharitableness that prompts the wish that a long-suffering public would pay half-a-crown for the Building News, and give us a chance of showing what we could do in the way of giving a *little* more for the same money.

Referring to the use of sea-water for London, on which I commented last week, the borough surveyor of Great Yarmouth writes that they have been using sea-water there for upwards of eight years, with the best results, for street watering and sewer flushing, and that they now raise upwards of 100 millions of gallons per year for these purposes, in place of about ten million gallons of fresh water used previously. The sea water costs them, all charges included—that is to say, repayment of capital, interest, and working expenses—about 2d. per 1,000 gallons, against 1s. per 1,000 previously paid to the water company. The sewers are now completely flushed, and a large sum saved in cleansing. But he asks whether it is necessary that London should go to the sea for water for flushing and street watering? He considers that the Thames a few miles above Battersea would yield a water sufficiently pure for these purposes, and that this could be delivered ready for sewer flushing and street watering at a cost which would not exceed 2½d. per 1,000 gallons. That is probable. On the other hand, some of us, since the construction of the new lock at Richmond, fancy there is a good deal less water in the Thames than there used to be, and that in a dry season none could be spared.

Museum Sunday seems to have been a success, as within the last fortnight even a bishop has pronounced in favour of the opening of these places on Sunday, at hours which would not interfere with those of public worship, and it may be assumed that his words stimulated some clergymen, whose minds were in a state of suspense on the subject, to join in the advocacy of the Sunday Society. The society has been in existence for nearly twenty years, but it has not yet induced the House of Commons to consent to the opening of any one of our national collections to the public. In the House of Lords, however, the feeling is not very strong against the throwing open of these institutions. In fact, ten years ago the House of Lords recorded its vote in favour of Sunday opening. This is more than the House of Commons has yet done, but it is many years since its opinion was tested. At the same time, the society has been gradually acting on public sentiment. Fifty-four sermons were delivered in London last Sunday, in its aid. It has secured the opening of 85 municipal institutions throughout the kingdom, and in London eight special art exhibitions. Dissenting ministers, as well as clergymen, joined in Sunday's demonstration.

I wonder whether the ten-thousand-pounder architect of the L.C.C. is to be debarred private practice while he builds the new asylum, which is to be erected at a little over half the recognised professional commission? The asylum is to cost £350,000, exclusive of site and furniture. It was proposed originally that the lucky architect should design the building and superintend its erection at a yearly salary of £800; but the committee discovered that the gentlemen eager to accept that princely remuneration were "only theorists, and knew nothing about the work," and so, in spite of the opposition of certain frugal councillors last Wednesday, it has been agreed the architect shall get "a sum not exceeding ten thousand pounds." Possibly one of "the theorists" may yet be found to take five thousand, thus saving the L.C.C. the other five. It is all quite right and proper, of course. With big advertisement bills to pay to member-owned newspapers, and jobs done by its own contractors at fifty per cent. over contractors' prices, the L.C.C. must save something out of somebody, and the shorn lambs of architecture are fairly tempered to the wind of adversity.

The transformations of ancient cities due to the march of improvement and the adoption of sanitary regulations are often accomplished by the destruction of much that is picturesque in domestic architecture. Even in Normandy the "improver" is growing more and more ruthless. Rouen, for example, which is still one of the most interesting cities of Europe, has seen some of its most ancient streets and squares sacrificed; and now the French Government have ordered the demolition of the old buildings which surround Rouen Cathedral, with the object of enabling the proportions and dimensions of that noble church to be better seen. Some of these buildings are of but trifling architectural interest, though as a group they are distinctly effective. One small house actually attached to the Cathedral, after a fashion common enough in other places, is among the doomed group; but as it prevents the public from having a good view of the famous Butter Tower in all its beauty, its demolition will perhaps be generally deemed defensible.

The Town Hall of Nottingham, which stood in the way of the new line from Annesley to the metropolis, has been sold, apparently to the satisfaction of hundreds of curiosity collectors, who trooped down from London this week to secure odds-and-ends illustrative of a happily past age. Everything of a saleable nature—from the dungeon rings and chains which tortured unfortunate debtors generations ago, to the judge's seat—was keenly bid for, and some of the items were very curious. The dock only fetched 23s. Early in the century a girl, scarcely in her teens, was sentenced to the extreme penalty of the law in this dock and hanged—too tame a sensation, I suppose, to attract present-day archæologists? The other items included: Witness-box, 41s.; gaoler's chair, 11s.; judge's seat, £3 5s.; cell door, £3 5s.; carved stone slab in debtors' cell, £3 5s.; two oak dungeon doors, 25s.; condemned cell door, £6 10s. 6d.; strong oak door leading to dungeons, 3s.

Messrs. Henry F. Joel and Co., electrical engineers, of 31, Wilson-street, Finsbury-square, E.C., have just issued a new and revised edition of their illustrated catalogue and price list of electrical plant and materials. This catalogue embodies in a convenient form for office use the best and most recent types of steam, gas, and oil engines, dynamos, electric motors, accumulators, switches, &c., patented and manufactured by this firm, and everything necessary for an electrical installation. The instructions for fixing and attending to these machines and apparatus are useful. We find also the technical terms explained, such as the units of electrical measurements, and many useful tables. Plans of engine-room arrangements are given, and the architect will be able to select the most effective engine and dynamo, for illustrations and price lists are given of improved vertical engine for small country house installations. Several types of gas and oil engines such as the "Otto," and a very economical form of oil-engine and dynamo combined are described. Joel's patent slow-speed dynamo appears to have given the best results. Two types are illustrated; also Joel's electric motor for alternating and continuous currents. Improved Joel-Pilsen arc lamps, switches, and instruments, casings, patterns of glass globes, and fittings will be found illustrated and priced, and every requisite for installation detailed.

OBITUARY.

We regret to announce the death, at the advanced age of 78 years, of Sir Charles Thomas Newton, K.C.B., D.C.L., the distinguished Classic archæologist and the re-discoverer of the Mausoleum of Halicarnassus. From 1861 till 1885 he held the Keepership of the Greek and Roman Antiquities in the British Museum, and during this period, by wise administration, by writings, and lectures at the Royal Academy, at University College, and elsewhere, and by example, he did much to put the study of archæology upon a sound basis and to promote its interests in England. During the years of his reign, the Museum collections were enriched not only by the acquisition of many sculptured and inscribed remains, but by such collections as the gems belonging to the Duc de Blacas, acquired at a cost of £40,000, and the bronzes and vases from Cyprus and elsewhere of Signor Alessandro Castellani. He had previously held office in the British Museum from 1840 till 1852, and in 1856-59, while Vice-Consul at Mitylene, he carried out important and fruitful excavations at Bridium (the ancient Halicarnassus), Cnidus, and Branchideæ. Accounts of his travels and discoveries in the Levant were published by Newton in conjunction with the late R. Popplewell Pullan. In 1889 he received the Royal Gold Medal of the Institute of British Architects. He had been in failing health for some years past, and resigned his appointments at the Museum and that of Yates Professor of Archæology at University College nine years since.

CHIPS.

It has been decided that the memorial to the late Bishop Bowlby shall take the form of a bust of the late bishop, to be placed in St. Philip's Church, Birmingham, with the addition of a brass tablet.

The seventh annual Arts and Industrial Exhibition was opened on Monday at Douglas, Isle of Man, by Sir West Ridgway. The standard of the exhibits was distinctly higher than in previous years.

The parish church of Portobello has been reduced internally to a wreck by a fire, for the outbreak of which the heating-apparatus is, as usual, supposed to have been responsible.

On Saturday the new line from Denaby Main to Wrangbrook, a distance of twelve miles, was opened for passenger traffic. The line connects the Manchester, Sheffield, and Lincolnshire with the Hull and Barnsley Railway, and stations have been erected at Denaby, Sprotborough, and Brodsworth.

Colonel C. Langdon Coke, C.E., conducted an inquiry at the Tabenacle Hall, Skewen, on Thursday in last week, in reference to an application made by the Neath rural sanitary authority for sanction to borrow £6,000 for waterworks extensions.

The plans for the Callander and Oban Railway—Ballachulish, Fort-William, and Banavie extension—were lodged with the Sheriff-clerk of Argyleshire on Friday by the solicitors for the Bill. This will be the largest railway extension north of the Tweed for the session.

The local board of Holywell have adopted, subject to the approval of the Local Government Board, plans for the sewerage and supply of water to the town prepared by Messrs. Wood and Brodie, civil engineers, Liverpool. The estimated outlay will be about £13,000.

A most useful book on the London Building Act, 1894, edited by Mr. Bernard Dicksee, district surveyor for East Newington and part of St. George the Martyr, containing the Act printed in full, with a comparison section by section with the various repealed Acts, extensive cross references and notes, legal decisions upon the repealed Acts that would also apply to the new Act, tables of thicknesses of walls, also the sections of the Public Health (London) Act, 1891, that are incorporated with the Building Act, &c., the by-laws of the London County Council relating to building, and a full and complete index to the whole Act comprising over one thousand references, illustrated with various diagrams, is being published by Edward Stanford, 26 and 27, Cockspur-street, Charing Cross, London, S.W.

Building Intelligence.

Bristol.—A fifth block has just been added to the chocolate and cocoa factories of Messrs. J. S. Fry and Sons. It forms an oblong structure fronting the bottom of Union-street, Nelson-street, and Little St. James's Back. Cornish grey granite has been used to the second-floor height, and the tiers of oriel windows at the angle of the principal streets are supported by a granite corbel, carved from a 10-ton block, and even now weighing half that amount. The upper portion of the building is constructed of buff Cattybrook bricks, with bands of red Mansfield stone and terracotta cornices and balustrading. A Mansard roof covers the premises, and there is a cupola at the chief angle. The cellar is fireproof. Lifts run from top to bottom of the new factory, and each floor communicates with an emergency fireproof staircase at the back. The floors are laid with slate slabs, 2in. thick, resting directly on the girders. The structure stands on 625 piles, driven to the rock 40ft. below the street level. The proprietors dispense with a contractor in their new buildings, and Mr. Hobbert and Mr. Searle have acted as clerks of works. Mr. R. Milverton Drake, of Bristol, was the architect.———The new Roman Catholic Church of the Holy Cross in Victoria-street, Bristol, was dedicated on Sunday. The first section of the church is 40ft. wide by 63ft. long, but the nave will be 81ft. in length to the chancel, which will be 20ft. 6in. by 20ft. The church is lit by electricity. The church in height is 60ft. to the apse, and is lit with traceried windows on either side. The roof is of pitch-pine. The tympanum at the entrance represents the Crucifixion; in the niches above are two figures. The carving has been executed by Messrs. Bolton, of Cheltenham. The contractors were Messrs. R. Wilkins and Sons, of Bristol.

Edinburgh.—The Victoria Hospital for Consumption and Diseases of the Chest, Craigleith House (adjoining Barnton-terrace), has been inaugurated by Lord Stormonth-Darling. A few years since the institution was removed from Lauriston-terrace to larger premises in Lauriston-place, and the latter building is to be retained as an out-patient department. Early this year Craigleith House was obtained on lease, and has now been transformed into a hospital. The structure is a mansion-house, surrounded by 7½ acres of wooded park, and provides accommodation for fifteen patients. The ground floor contains two male wards, each with accommodation for three patients, the resident physician's apartments, laboratory, and store-room. The first floor contains three larger wards for female patients, and two smaller rooms, holding in all eight patients, and the matron's room. The second floor contains bedroom accommodation for day and night nurse and maids. The buildings have been adapted to their present purpose from plans by Mr. S. H. Capper, architect, of Edinburgh.—A baldacchino of white Bath stone has recently been constructed in the sanctuary of the Catholic Apostolic Church, Broughton-street. The canopy is carried on four pillars, which constitute a square of 13ft. They have carved capitals, and are carried up into four pinnacles, between which is an arch and gablet. On each gable apex is an angelic figure holding a musical instrument. The canopy is vaulted and domed, and around the dome, which is capped by a finial and cross, are statues in niches of apostles and prophets. The total height of the baldacchino is 37ft. Above each arch is a panel of Venetian mosaic work with a design on a gold ground. The baldacchino was designed by Dr. Rowand Anderson, the architect of the church. It has cost £1,000, exclusive of the statuary, which cost other £300. The statuary was executed by Mr. Birnie Rhind, A.R.S.A. Another work in completion of the church has been the carving of the capitals of the pillars in the chancel and of the great chancel arch. There are about a hundred of them, and each forms a separate design.

Heywood, Lancs.—The technical school in Hind Hill-street was opened on Saturday by Mr. Thomas Snape, M.P. The building on the three principal sides is faced with red stock Ruabon bricks, with dressings of Clayton stone. The internal joiners' work throughout is in pitch-pine. The school covers 680 square yards. There are three large class-rooms, science lecture-room, 60ft. by 30ft., and science drawing-room, 32ft. by 21ft. 6in., and committee-room, 18ft. 6in. by 18ft. The first floor is devoted to chemistry and art. The chemical lecture-theatre is 31ft. by 21ft. 6in.; the laboratory 34ft. 9in. by 21ft. 6in. There are also balance and store rooms. Messrs. Blakeley and Bell, Hopwood, have carried out the main contract. Messrs. Woodhouse and Willoughby, of Manchester, have been the architects, and Mr. Robert Hardman, of Heywood, was the clerk of works.

Heydon, Norfolk.—The fine old parish church of SS. Peter and Paul, which for the last few months has been undergoing partial restoration, was formally reopened the other day The principal works of restoration have been that of the nave roof, the old timbers of which have been removed, cleaning and re-using, however, such of the old as were practicable, the deficiency being made up with new timbers of English oak, the whole oiled and covered with oak boarding; re-casting and re-laying the lead, repair to the coping and parapets, new gutters, &c.; re-glazing the clerestory windows, and re-stuccoing the external walls. Mr. T. H. Blyth, contractor, of Foulsham, has carried out the principal works, under the superintendence of Mr. Herbert J. Green, architect, of Norwich.

Leeds.—Opening services in connection with New Zion Chapel, Clark-lane, were held last week. The chapel, which is 60ft. by 39ft. 6in., will seat 300 persons on the ground floor and 70 persons in an end gallery. At the rear is a schoolroom accommodating 300 scholars. Advantage has been taken of the fall of the land to provide underneath the school and chapel a lecture hall, 28ft. by 21ft., and also eight class-rooms, each of which is 15ft. by 11ft. The style adopted is a simple treatment of the Gothic style. In the front gable is placed a large tracery window of stone, and on the left is a small tower. The contracts for the building amount to £2,600. The buildings have been erected from the designs, and under the superintendence, of the architect, Mr. W. Braithwaite, South Parade. The cost, exclusive of the site, has been £2,700.

South Queensferry.—Lord Rosebery formally handed over to the town council of South Queensferry a permanent memorial to his late wife, in the form of a hall for the use of the inhabitants of the burgh. The hall, which has cost between £3,000 and £4,000, is situated immediately behind the old Tolbooth of South Queensferry. It is built in the 17th-century Scottish style, and is in keeping with the old steeple which immediately adjoins. At the further end of the hall there is a small gallery, capable of seating about fifty persons. The ceiling is formed of three elliptic arches, supported by pilasters. A decorative effect is given by the modelled cornice and frieze work. On a level with the gallery is a billiard-room, with card-room adjoining. The architects of the hall were Messrs. Sydney Mitchell and Wilson, Edinburgh, and the work has been carried through under the superintendence of Mr. William Campbell, Lord Rosebery's clerk of works.

St. Austell.—The first Y.M.C.A. building erected in Cornwall was opened at St. Austell on Thursday in last week. About £2,800 has been spent on the building, which is situate in the centre of the town, at the corner of Victoria-place and Vicarage-hill, on a site formerly occupied by a public-house. The style is a simple treatment of Italian. On the ground floor there are an entrance hall, cloak-room, and lobby, a reading-room, 20ft. by 16ft., secretaries' office, gymnasium, 30ft. by 20ft., lavatory, and offices. The floor above contains a library, 17ft. by 13ft., and a lecture-room, 35ft. by 18ft., the latter of which is capable of division into two class-rooms by means of revolving shutters. Those on the ground floor are 14ft. high, and those on the second floor 13ft. The masons' and plasterers' work was intrusted to Mr. Hunkin, and the carpenters' and joiners' work to Mr. W. H. Smith. Mr. H. Snell, of Plymouth, was the architect.

Torquay.—St. Matthias' Church, Torquay, which was built in 1858 and has twice been enlarged, was reopened on Friday, after undergoing considerable alterations. The church was designed by Mr. Selwyn, but the present alterations have been carried out from plans prepared by Mr. J. L. Pearson, R.A., of London. They have included the lengthening of the nave, rebuilding the nave arcades, building the clerestory, raising the aisle walls, and putting in a new pitch-pine panelled roof. The latter is divided into bays, and the aisles have new roofs similarly treated. The west end of the nave is inclosed between the wide responds of the arcade by an oak screen executed by Messrs. Harry Hems and Sons, of Exeter. The floors are to be laid in mosaic work. The contract for the alterations has been carried out by Messrs. J. W. Bunning and Son, of London. The clerk of the works was Mr. H. Cane.

◆

STATUES, MEMORIALS, &c.

Edinburgh.—On Saturday a memorial to the Scottish singers Wilson, Templeton, and Kennedy, which has been placed on the rock face of the Calton Hill overlooking Waterloo-place, was unveiled. The memorial is in the form of a freestone slab, with three portrait medallions in bronze encircled by wreaths. That on the left incloses a portrait of Wilson, modelled from an old engraving; that on the right, Templeton, taken from a portrait presented by the singer to David Kennedy; while lower, in the centre, is a medallion with a likeness of Kennedy. The memorial is the work of Mr. W. G. Stevenson, A.R.S.A., from a design by Mr. Thomas Bonnar. Mr. John Smart, R.S.A., president of the Burns Club, handed over the memorial to the Lord Provost.

Winchester.—A memorial, erected by subscription, to the late Bishop Harold Browne was unveiled on Saturday in Winchester Cathedral by the Dean of Durham (Dr. Kitchin). The memorial, which is placed between the nave and south aisle in the fourth bay from the east, consists of a cenotaph of alabaster raised upon a marble plinth, ornamented in the Gothic style with open panels filled-in with Purbeck marble. At each end are statuettes of saints in niches, and six similar figures are in other niches at the sides of the monument. The recumbent figure of the late bishop in mitre and cope, and having the pastoral staff, rests on the slab. Messrs. Bodley and Garner, of Gray's Inn, designed the memorial.

◆

CHIPS.

The new hospitals, Gosport, are being warmed and ventilated by means of Shorland's patent Manchester stoves, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

A marble bust of the late Earl of Derby, K.G., set upon a pedestal of veined Connemara marble, was unveiled in the Town Hall at Liverpool on Friday. It has been executed by Mr. Thomas Brock, R.A.

On Wednesday last, the new church schools which have been built in the parish of St. Andrew's, Wigan, were opened. The schools will provide a total accommodation for about 500. The work has been carried out by Mr. C. B. Holmes, of Wigan, at a cost of about £2,800. The architects are Messrs. Heaton and Ralph, Wigan.

The new market provided by the local board of Pontypool was formally opened on Saturday. It stands on the site of the old one, covers an area of 20,070ft., is estimated to provide standing accommodation for 6,000 people, and has been built at a total cost of £22,280. The style is Free Tudor, and there are five exits for the public, together with an unloading dock for goods. The architects were Mr. R. Williams, A.R.I.B.A., London, and Mr. D. J. Lougher, Pontypool, and the contractors Messrs. Morgan and Evans, Pontypool.

The contract for the new North Bridge at Edinburgh being now signed, Sir William Arrol and Co. will lose no time in setting about the work. A portion of the street near the Post-office, where the foundation of the first pier of the new bridge will be laid, is being barricaded-in this week.

After complete renovation, St. Matthew's Church, Little Lever, Lancs, has been further embellished by the addition of a chancel screen in oak, and oak Communion rails, both elaborately carved by Messrs. Earp and Hobbs, of London and Manchester, who have also erected a mural monument on the north wall of chancel to the memory of the late vicar. The work has been carried out from designs, and under the superintendence of Mr. R. Knill Freeman, F.R.I.B.A., and surveyor for the diocese.

The foundation-stone of a new church in Ferry-road, Littleham, near Exmouth, was laid on St. Andrew's day. At present it is not intended to build more than the chancel and a part of the nave, and this section, it is estimated, will cost about £2,000. The style is Gothic, and the building is to be faced with limestone and Ham Hill dressings. When completed it will be 102ft. 5in. by 57ft. 11in.; the designs provide for chancel, nave, aisles, vestry, and bell tower, and there will be seating accommodation for 800 persons. The architects are Messrs. Paul and Cogswell, London; and the builder is Mr. W. H. Perry, of Exmouth.

FIRE PROTECTION.

A LECTURE on this subject was delivered before the Society of Arts on Wednesday evening by Mr. Edwin O. Sachs. He pointed out that towns owed their safety from fire, not so much to brigades, as to preventive legislation based on the practical experience and research of architects, engineers, and fire experts. Fire protection was a combination of fire protection, fire combating, and fire research. Preventive measures might be partly contained in the local building Acts and partly in a separate code of fire-survey regulations, supplemented by special rules as to the treatment of extraordinary risks, such as the storage of petroleum, the manufacture of explosives, and the performance of plays. Self-help for the shopkeeper, the lodger, or the private householder could scarcely be regulated. There were places where, without any regulation being attempted, and thanks entirely to the influence of training in classes, most residences could boast of a hand-pump, a bucket, and a crowbar, the proper use of which was known to most of the household. Self-help in small risks must be distinctly encouraged by the authorities, without any irksome interference with personal liberty, simply by the provision of street pillar-boxes, with the necessaries of first aid, including perhaps a couple of scaling-ladders, and, further, the arrangement of some opportunities for householders to learn how to handle them. The link between self-help and outside help was the fire-call. The efficiency of the fire-call depended not only on the instrument employed and its position, but also on its conspicuousness and the indications given to find its whereabouts. As to the organised outside help, it need not simply be limited to the attendance of the fire brigade. Special arrangements might be made for the attendance of the local police force, a public or private salvage corps, an ambulance, or in cases a military guard. Arrangements might further be made for the attendance of the water and gas companies' servants, even officials from the public works office and insurance surveyors. The author laid stress on the point that the efficiency of the outside help depended in the first instance on the clear definition of duties and powers of all concerned, then on the organisation, and last, but by no means least, the prestige, the social standing, the education of commanders and their ability to handle men easily. In dealing with the provisions of local bylaws for protection from fire, the author urged that if a locality had a proper fire-brigade and the force was decently handled, spreads of fire from one house to another could be absolutely barred. The division of a building or a large "risk" into a number of minor ones was only possible to a certain extent. In lieu of spending enormous sums trying to make each of the minor "risks" impregnable, the aim should be to try to retard the spread for a certain limited time after the flames had really taken hold of the contents. In those minutes most fires would have been discovered, and a sufficient number of firemen could be on the spot to localise the outbreak, and prevent the conflagration being a big one. In a warehouse or factory, with well-built wooden floors, thickly pugged, and the ceilings perhaps run on wire-netting instead of on laths, with ordinary double-ledged doors safely hung, at the most perhaps lined with sheet-iron on asbestos cloth, a very stiff blaze could be imprisoned for an hour. The general mistake of expensive iron and concrete construction was its aptitude to allow some breach being easily made through which the fire spread. Directly a fire had got a hold these composite floors were, again, much too dangerous for firemen to work on or under. Further, if a strong stream of water touched the hot iron there was often an extra danger, and after the fire had been extinguished the ironwork would be so damaged that it would require entire renewal, and the brickwork would probably be so strained and bulged that the re-erection would have to commence from the footing. A simpler construction was in most cases the most satisfactory. The few iron and concrete floors, for instance, which would stand some strain were too expensive to allow their introduction for fire protection alone, for it was not only the expense of the floors which have to be considered, but that also of the supports and the surrounding walls. All shaft openings should be as small as possible, well armed with shutters, and the lift not only vertical doors, but also horizontal flaps, which would cut up the well into sections. Division of "risks," commonsense construction, and proper staircase accommodation were really all that fire protection required, and where the special Building Act clauses had been kept within the lines indicated there had been little friction and discontent. As to the fire survey regulations, they should mainly prevent the actual outbreak of fire. In certain classes of risks fire survey could also increase the personal safety of the inmates, and the possibility of a fire spreading might be lessened. The actual preventive work of the surveyor would, however, mostly consist in the warning of property owners against temporary stoves standing on ordinary floor-boards, sooty chimneys, badly hung lamps, dangerous burners, and gas brackets fixed in risky positions. So far as the safety of the public in theatres and public assembly halls was concerned, attention should be chiefly given to the exits. Spread of fire, and even its outbreak, were secondary considerations, for a panic caused by a suspicion of fire would be quite as fatal as where a conflagration was actually started.

A SPECIFICATION ANNOTATED.—IV.

17. *Extra Work.*—Where work extra to that provided for in this contract is contemplated, notice thereof shall be given by the architect to the builder, and an estimate obtained for same; and in no case will any claim for extra work be entertained unless the claim be made when that work is ordered, and the price agreed upon before the work is commenced.

Nine out of ten building disputes arise from neglect of this simple provision. It seems incredible that a man will order any alterations to be made in work, involving a departure from the contract, without first ascertaining, quite definitely, the extent and cost of the proposed alteration; yet this is done every day, and in the most reckless fashion. A contract is based on plans, specification, and quantities prepared, may be, with the greatest accuracy; in a thoughtless moment, an order is given for some alteration, apparently insignificant in itself, but which involves some modification of items in every trade. No estimate has been made of the cost before the alteration has been carried out; the work is done, and the circumstance forgotten; other alterations are made from time to time with the same result. The client, too, may directly or indirectly order alterations of one kind or the other to be made, without first ascertaining if such involves any extra cost, and, if so, to what extent. In this way architect and client muddle the matter between them until the building account is presented, when both, astonished at the formidable sum set down for extras, determine to dispute payment, and thus find themselves landed in a lawsuit, or, what is worse, an arbitration. In this game the builder, like "Brer" Rabbit, "lies low" until "Brer" client is securely fastened in his box, and then, through holes in the lid, boiling water is poured on him in the shape of extras until he is well-nigh scalded to death. "Brer" architect, looking on, enjoys the fun, for the more extras are piled on, the better for him. Young architects, who have only learned the "tasty" part of their business, will perhaps find it well to be warned in time that many builders undertake to do certain work for less than its value, feeling certain that in "extras" they will recoup themselves, and turn a prospective loss into a handsome profit, and this through the incompetence of the architect. One of the strangest facts connected with the building trade is the enormous increase in the value of labour and materials which invariably takes place in every job after the contract is signed, especially in the execution of extra work. No architect worth his salt will involve his client in any expense beyond the contract without first obtaining his consent, and the client will indeed be an *idiot* if he does not warn his architect in writing not to pledge his credit with the builder or any manufacturer who may supply goods for his work. It is simply monstrous that an architect should negligently, or deliberately, involve his client in an outlay never contemplated by him, and yet this irregular system of doing work is of common occurrence.

18. *Written Order Necessary.*—No claim from the builder will be entertained for extra work without the architect's written order for it, and the builder is invited to decline doing any such work without having first obtained the written order necessary to secure payment for same.

The necessity for this clause is obvious. If it is strictly enforced, no dispute can ever arise out of the question of extra work, for each separate alteration made as the work progresses is valued, and the written order for its execution placed with the contract papers. The architect will, if he is a wise man, furnish his client with a copy of every such order, and the latter cannot, on completion of the works, plead ignorance of the extra cost. He may, however, very reasonably complain if works are ordered and expenses incurred without his knowledge. Extra works somehow reflect on the ability of the architect as well as on the honesty of the contractor, and both will anxiously avoid them if they are honourable men. This does not, however, apply to additional works which are not in any sense extra works, as the word "extra" is usually understood. An "extra" is some work undertaken of necessity to make good an omission or defect in the original contract.

19. *Departures from the Contract.*—No departure from the drawings in this specification will be allowed, except by the architect's written permission. Should such departure involve extra cost, then it shall be dealt with as already provided for in preceding clauses. Should it involve a saving of cost in the original contract, then such saving shall be deducted from any sum due to the contractor on account of the work; but should such departure be made through error, or neglect to carry out this contract, then all such work as may be found deficient in any way must be pulled down and reinstated at the contractor's sole expense.

From the very beginning of the work, some contractors never cease to offer suggestions as to how the work could be done in some way better than that provided in the specification. If the latter is written by a competent man, such suggestions become a nuisance, and these may be best dealt with in this way: The proposed alteration may involve extra cost, and this will probably be the reason why the suggestion was made; the contractor may be allowed to carry it out at his own expense, giving this permission with its proviso in writing. The alteration may effect a saving in the work. If permitted, the saving should be assessed at once, and an arrangement made to deduct such saving from the contract sum. If the alteration is made intentionally or by the neglect of the contractor or anyone in his employment, then the architect should at once insist on the work being carried out in accordance with the contract. When the contractor sees he has nothing whatever to gain by making suggestions, then he will cease to make them. A builder who has been brought up to the business, and who is not a mere financial agent, as many builders nowadays are, must of necessity have acquired some experience, and this, if brought to bear on the documents which go to make up a contract, may lead to suggestions deserving consideration. In this case there is no conceivable reason why the architect should not meet the builder in an amicable way, *and, before the contract is signed*, discuss the various clauses and provisions in the specifications, with a view to any modification that may appear desirable. This would render the necessity for any subsequent departures from the contract altogether unnecessary, except something unforeseen happens during the execution of the work. The foregoing remarks are made in the interest of the architect, and some advice to the contractor may not be altogether out of place here. He will act wisely if, when plans and specification are placed in his hands for an estimate, he makes no remark on any absurd clause in the specification or any mistake in the plans. An architect who cannot make plans and specifications for a contract without the builder's assistance is unfit to be intrusted with the work, and he will not care to employ a builder who gives any evidence of being possessed with a knowledge superior to his own. The chief duties of a contractor are:—(1) To believe in the architect's infallibility. (2) To make everything pleasant for the architect. (3) To carry on the work in such a manner that the client shall be satisfied with the architect and the contractor. In fact, the contractor sought after at the present day is the man who will make things work pleasantly "all round." The execution of the work in a substantial manner he will find to be altogether a secondary consideration. In illustration of this statement the following story is worth telling. Men of any experience in building work can no doubt call to mind similar instances in their own practice. A young man just commencing work, and who had served his apprenticeship in the office of an eminent London architect, was intrusted with the designing and erection of a public building to cost about £2,000. His professional knowledge was apparently limited to the facts that a 19th-century building should be "fixed up" with 15th-century doors and windows, and that all arches should be four-centred with horizontal cubic mouldings, including the usual little panelled spandrels at the sides. So, of course, designs were made, embodying the foregoing very original conceptions, and these were duly approved by his clients, who thought them "splendid." Now, though a man may pick up any quantity of details of doors, windows, mouldings, &c., by visiting any of the numerous Mediæval buildings in this country — and hundreds, aye, thousands, have done so—yet as the Mediæval men did not apparently leave their specifications for posterity to copy, as they left their buildings: our architect's mind was saturated with 15th-century details; but he had not a single idea of construction as practised in the 15th or any other century. Yet, as before obtaining an estimate, he must have a specification, and failing to evolve one with the aid of a "Comprehensive Specifier," he found refuge—like many others of his kind—in the bosom of "a mere quantity surveyor," who fitted him up with specification and quantities to match his plan. A contract was entered into, and some few months after, the roofs of the building being fixed, our architect paid one of his usual visits to the work. Another architect, who had not the same educational advantages as the 15th-century man, was invited by him to look over the work—the latter happened to be passing at the time. Now this second man had read through the specification some few months before, and being rather interested in this building, he preserved a fair recollection of many of the clauses det scribing the class of material to be used. Amongs- many other things, he noticed that the pieces of timber lying about, and cut off the rafters, looked very sappy, and very unsuitable for any purpose but fire-lighting. On referring to the specification, the provision was found to be for "Best Memel, Dantzic, or Riga fir, free from sap, &c." No remark was made about this at the moment; but subsequently, when they were together alone, the two professional men conversed in the following fashion:—19th-century Man: "I noticed that all your roof-timbers are of foreign sawn timber, nearly solid sap, many not of the scantling specified, the copes being waney, and covered with bark. Such timber is 4th or 5th Swedish, and worth not more than 6d. or 7d. per foot, whilst the contract provides for sound timber, free from sap, and worth six times more than your contractor is giving you." 15th-century Man: "Is it so? I did not notice this; but it must be all right, for the contractor is a *very pleasant fellow*, and was strongly recommended to me by——, you know, that Queen Anne man who puts such 'go' into his work. Well, I don't know anything about timber, and don't want to be bothered with it. The work will, I suppose, last our time, and if it does, I shall be quite satisfied." 19th-century Man: "But this is very unfair to the other builders who tendered for the work, as they may have set down a price for the timber you specified, and therefore must have sent you higher estimates than your contractor; and it is also unfair to your clients, for you are allowing them to be robbed of about 2s. 6d. on every cube foot of timber used in that building." 15th-century Man: "My dear fellow, why should I bother about it? My clients have seen the work, they are delighted with it, and it would be cruel to ask a decent fellow like that to take the roofs off. Besides, the disgrace of the thing!" The roofs, of course, remained, as well as other departures from the contract, all made by the contractor, in his interest, and with impunity, because he was a "pleasant fellow," and the architect a fool. One other anecdote may find a place here. An architect in a provincial city sought by advertisement for a "clerk of the works." A foreman mason who had for some years been employed by another architect in the same city applied for the post. On being asked who he had worked for, he explained that he worked for an architect who frequently dispensed with the contractor, and had his work done "day-work" under a general foreman. The advertising architect replied, "I know him, he looks after his work himself without a builder; but *I am an architect—I don't profess to know anything about building*," and he didn't! The contractor, then, who works for men of this class, can make what departures he pleases from the contract, and many fully calculate on being able to do so when they send in estimates for any ordinary work, the enforcement of the specification being the exception, not the rule. It is pleasant to know that all contractors are not altogether indifferent as to the class of work they turn out. One who had a very good knowledge of 13th-century mason work, and who liked good work for the work's sake, sometimes sent back the architect's details with the message that "he was not going to put up rubbish like that"—meaning what was shown on the drawings—"for anyone, and the drawings must be altered." This contractor frequently put mouldings into his work that were not shown on the drawings, and did not hesitate to pull work down if it was not satisfactory in construction or design. It need scarcely be added he did not succeed in making his business a financial success.

20. *Architect Sole Arbitrator.*—It is generally found advisable to make the architect's decision on all points of dispute arising out of a contract final and binding on both parties to it. This arrangement shall, therefore, obtain in this contract, and must be accepted by the builder. Is this clause fair to the builder, or is it not?

Answering from experience, it is perfectly fair under certain conditions, and these are:—(1) That the architect should act impartially between client and contractor. (2) That he should have a thorough practical knowledge of building work and materials, and the customs of the various trades, so that, having a desire to act justly, he shall be competent to do so. To illustrate this, an architect specified that a shop was to be lined throughout with ¾in. matched boarding. When the work was completed, he refused to certify for payment because the matched boarding, as fixed, measured to little more than ½in. thick. Now he had no desire to act unjustly. He wanted ¾in. boarding, and specified it, not knowing that in the trade ¾in. boarding meant, by common custom, boarding prepared from ¾in. rough boards—that is, from the saw. This would, of course, hold to ⅝in. slack. Here the architect acted unjustly through ignorance of trade customs, and he should have inserted a clause in his conditions of contract which would have placed the interpretation of his specification outside them. It is most unsafe with some architects for the builder to agree to abide by their decisions, and accept them as final, for many cases of dispute arise through omissions in the plans and specification, and these have been due to incompetence or neglect. The architect, in these cases, will be sitting in judgment on himself, and it need not surprise anyone if his judgment is given in his own favour by deciding against the contractor. A favourite clause in some specifications is to this effect: "Everything necessary to complete the buildings in a proper manner and to the architect's satisfaction is to be done by the contractor, *whether such be shown on the drawings or not, or included in this specification.*" This is setting a net for the builder with a very small mesh indeed, and if he gets caught he has himself only to blame, for how is anyone to tell what the architect may consider "proper" to the completion of a building? Plastering is necessary to the proper completion of a building. What if it is omitted altogether in the specification? A specification for a house in the North of England provided no skirtings to any of the rooms; it provided a pump to a rain-water tank, but no tank; and the drawings showed a drawing-room projecting beyond one side of the house, with joists to carry a ceiling, but no provision was made for a lead or any other roof! In this case the architect had a clause in his contract similar to that sketched above, and decided that the contractor must supply all these things to his satisfaction, though they were omitted from the plans and specification. It will, then, be advisable for the architect at all times to make himself sole arbitrator between client and builder, and the latter will, if he is a cautious man, be careful who he accepts as sole arbitrator in disputes involving his personal credit, and frequently large sums of money. In many instances in which a contractor will sign anything an architect may send him, and do it with impunity, it may be surmised that arrangements of a delicate nature exist between them—in plain English, that the contractor affords aid of a material kind to the architect in consideration of the latter interpreting the specification and other contract drawings in a manner not to the client's advantage. No architect of any standing will descend to such conduct as this; Fellows of the Royal Institute of Architects never do it—well, "hardly ever." It is sometimes arranged that a dispute shall be referred to the President of the Institute of Architects; but this would be, so far as the builder is concerned, to get from the frying-pan into the fire. To refer a dispute to a builder of high standing would be a better plan, but not so satisfactory to the architect; and perhaps the worst plan of all would be settlement by a law-suit, for a number of very ingenious gentlemen talk learnedly about, and decide on, matters of which they know nothing. One is at first much impressed at the solemnity with which legal gentlemen discuss building questions; but when a listener hears counsel talking seriously about "a looped and sheeted stock lock," the proceedings pass from the sublime to the ridiculous.

BOOKS RECEIVED.

Joints in Woodwork, by Henry Adams, M.Inst.C.E., &c. (London: 60, Queen Victoria-street), is a reprint of a paper read before the Civil and Mechanical Engineers' Society by the author. Professor Adams' paper treats in a thoroughly comprehensive manner this subject. He takes it out of the dry, technical phraseology of the treatise, and handles it from a philosophical standpoint. Professor Rankine's well-known principles are laid down as those necessary to be considered in designing wood-joints and framing. To these useful rules Mr. Adams adds a sixth: "To select the simplest forms of joints, and to obtain the smallest possible number of abutments." The joints are classified into those for lengthening ties, struts, and beams, such as lapping, scarfing, &c.; bearing joints, as halving, notching, cogging, &c.; joints for posts and beams, as tenons, joggles; joints for struts, with ties and posts, as oblique tenons, &c. Many practical remarks are made about "building up beams" and bearing joints. Fastenings are also discussed under different heads, and the experiments of Mr. Bevan on adhesion of nails are quoted. The paper may be read with advantage by all students of wood or timber construction.——*Electric Lighting and Power Distribution*, by W. Perren Maycock, M.I.E.E. (London: Whittaker and Co.), is an elementary manual for students preparing for the preliminary and ordinary grade examinations of the City and Guilds of London Institute. Mr. Maycock is an able exponent of the subject in the above Institute, and this volume has been prepared by him as an elementary work for his classes. Some acquaintance with the science of electricity and magnetism is presumed. As an introduction to more advanced works, the book will be found well suited. The definitions are clear and concise, and all unnecessary verbiage is avoided. The work is full of well-drawn diagrams and illustrations of machines and apparatus; it is simply arranged, and the author has taken ample pains to give directions to the student, and to initiate him in the principles of the science.——*Electric Light Installations*, Vol. III. Application: a Practical Handbook, by Sir David Salomons, Bart., M.A., vice-president of the Inst. of Electrical Engineers; seventh edition revised (London: Whittaker and Co.), is the concluding volume of a work we have before noticed. The reputation and experience of the author are a sufficient recommendation and guarantee. The accumulators and apparatus have been described in the two first volumes; in this the author deals with the most efficient method to produce the best results. The information is up to date, and the outline specification given is valuable. The work is well illustrated.

NOTES ON BUILDING PRICES.

By John Leaning.

(*Continued from p.* 769.)

SCREWS.

Nails have been considered in a previous section of this series. Screws are much more used in joinery than in carpentry, and their value may reasonably be mentioned here.

Their variety is considerable, and those used by the carpenter or joiner are sometimes by them called "wood-screws," possibly to distinguish them from those used for metal. The old shape of screw (with a blunt point) has been almost entirely superseded by Nettlefold's patent pointed screw, which is pointed like a gimlet, and acts in the same way.

The screw merchants publish a screw list, the prices in which are invariable, but subject to a discount, sometimes, but not often, changed. This discount is now 60 per cent. off iron, and 50 per cent. off brass, and for specially large quantities another 2½ per cent.; but this latter does not concern us, as it is practically a cash discount.

The numbers indicate the diameter of the screw, the first number being the smallest in each series, except ¼in. and ⅜in., which include screws of still smaller diameter than No. 1, designated 0 and 0 0, and ½in. designated 0.

The stereotyped list is here appended—

32	100	0									

Round Heads are charged one size higher than Flat Heads.

Ideas as to the proper length of screw to be used for a given thickness of wood will vary with different men; but the following table shows some reasonable conclusions. The maximum length ever used is equal to twice the thickness of the wood.

SCREWS FOR DEAL OR OTHER SOFT WOOD.

Thickness of wood—	½	¾	1	1¼	1½	1¾	2	2¼	2½	2¾	3in.
Length of screw—	1	1¼	1¾	2¼	2¾	3	4	4	4	5	5
List number of screw—	8	9	10	11	12	13	14	14	14	18	18

For hard wood, the screws would be brass, and two or three numbers of the list earlier in each case.

For 3in. butts about 1½in., No. 9, and for 4in. butts 1½in., No. 12, are commonly used.

In day accounts the numbers are never stated, and often not the lengths. When the lengths are not given, the valuation can be little more than a guess, founded upon the nature of the item for which they are charged. When the lengths are mentioned, the numbers may be adopted from the foregoing table.

When charged in day accounts, the contractor expects to get, and obtains when he can, 3d. per inch *per dozen* for iron screws and 4d. for brass. It must be remembered that the waste of nails and screws on some buildings is considerable; but with good management 5 per cent. ought to cover it.

	Days of a joiner.
The driving of screws per inch per dozen	·024
Add if in hard wood	·010

Best Scotch glue costs 65s. per cwt.; glass paper costs 14s. per ream.

Analysis.—The cumbrous processes of analysis such as follow are illustrations of the methods of obtaining prices; but it will be obvious to the reader that the practised estimator will rarely require them. Reference to priced bills of quantities of past work, records of the cost of particular items in the builders' prime-cost book, his private memoranda, or recollections of similar things will save him the time and trouble of such tedious work.

The constants for labour only, for labour "from bench," and for fixing respectively, have been kept separate, as the fixing of joinery often involves bearers, backings, or plugging, which is more conveniently valued separately, according to the requirements of each case. For each item requiring valuation, the cost will therefore be the value of the constants for labour and fixing plus the value of the material.

Labour and Fixing.—As a preliminary to pricing, it is necessary to settle the value of the fixing only of various kinds of joinery, and of the incidental labours of common occurrence.

Labour Only.—			Days of Carpenter. Per foot run
Chamfers 1in. wide and under,		straight ..	·002

CHIPS.

A hall, dispensing-room, and laboratory have been added to the Pharmaceutical Society's premises in York-place, Edinburgh, from designs by Mr. Hippolyte J. Blanc, A.R.S.A., of that city.

At the first meeting of the newly-elected school board for Eling, Hants, a letter was read from Messrs. Mitchell, Son, and Gutteridge, of Southampton, architects, inclosing their charges against the old board, amounting to £130, and they likewise applied for the post of architects to the present board. Mr. S. K. Pope, also of Southampton, wrote, offering his services as architect to the board in case they decided to appoint an architect, and stating that his charges would be 4 per cent. on the contract. Mr. Gutteridge was present, and stated that his firm's charges would be 5 per cent. The decision of the school board has not yet been made known.

A house for private patients is about to be commenced at Garlands, Carlisle. This is part of a scheme for providing accommodation for paying patients, consisting of a central main administrative building, and a series of houses on either side. An excellent site has been chosen in the asylum grounds. The designs are being prepared by the county architect, Mr. Geo. Dale Oliver, Lowther-street, Carlisle.

Mr. Codrington, R.E., Local Government Board inspector, held an inquiry at the Town Hall, Burton-on-Trent, last week, with regard to an application by the town council to borrow £53,213 for sewage disposal, sewerage works, electric-lighting, new stabling, a refuse destructor, and for furnishing the new town hall. The surveyor gave the details of the work proposed to be done, and then Professor Dewar gave evidence as to his analysis of the Burton sewage, describing the constituents of which it was composed and the manner of dealing with it, showing that by the adoption of the lime process the great nuisance at the farm had been practically abolished.

Mr. Arnold Taylor, Local Government Board inspector, held an inquiry on Friday into an application of the Liverpool City Council for permission to borrow £60,000, for the purpose of reconstructing the public baths at the Pierhead. They were the first buildings of the kind erected in the provinces, having been rebuilt by the corporation in 1825-9, at a cost of £24,500. The structural condition of the premises is now far from satisfactory, and they will be again remodelled from plans by Mr. T. Shelmerdine, the city surveyor. The men's bath will be enlarged from 46ft. by 27ft. to 100ft. by 46ft., and the ladies' bath from 38ft. by 27ft. to 50ft. by 38ft., and 17 private baths will be added, additional land being taken on the north side.

Col. J. O. Hasted, R.E., a Local Government Board inspector, conducted an inquiry at the Bacup Town Hall, on Friday, for sanction to borrow a sum of £18,000 for works of sewerage in the Stacksteads district. Mr. Hyde, the town clerk, said that at present the sewage from the district passed into the Irwell, and the Mersey and Irwell Joint Committee had obtained an order calling upon the council to carry out a system of sewerage within a period expiring in January next. The scheme now proposed would form a connecting-link between the sewerage systems of Bacup and the district under the control of the Haslingden, Rawtenstall, and Bacup Joint Outfall Sewerage Board, the latter authority now being engaged in constructing outfall sewerage works at Ewood Bridge.

Correspondence.

THE R.I.B.A. AND DISTRICT SURVEYORS.

To the Editor of the Building News.

Sir,—On Monday evening last I attended, by invitation, a meeting of the Institute, having reference to the question as to the status of district surveyors, at which a unanimous resolution was adopted requesting the County Council to refrain from making it a condition of their appointment that they should abstain from private practice. It was also suggested that all appointments to the office of district surveyor should be from the ranks of the Institute.

I refrained from disturbing the harmony of this "Mutual Admiration Society" by offering any remarks upon the question under discussion; but it struck me that a very material point was overlooked—viz., that the office of district surveyor exists for the benefit of the public. If it existed for the benefit of architects, and those architects members of the R.I.B.A., the discussion at Conduit-street would have been quite in order, and would have done credit to a trades-union meeting; but seeing that the office exists for the protection of the public, the public, through their representatives, deem it advisable to impose the condition objected to.

The state of affairs existing in some districts when the County Council took office was little short of a scandal and disgrace, and the district surveyors have only themselves to blame that the County Council set about altering the condition of things by making the area of the districts greater, and thereby making it worth a candidate's while to accept the office, and give up his private practice. I do not find, however, that members of the R.I.B.A., although they waxed so eloquent at having to submit to the indignity the London County Council have imposed, have refrained from applying for appointment either to newly-formed districts or accepting an additional area to their own districts on the new conditions, as I find that nearly all appointments made since 1890 have been made to members of the R.I.B.A., and there are other members waiting to embrace the opportunity should it arise. If the Institute had been really in earnest over the matter, they would have called out their members and proclaimed a general strike.

Another point which clearly showed that it was only a trades-union affair was brought out by the opener of the discussion in his statement that he thought that a district surveyor should not practise privately in his own district: not because it was expedient in the public interest, but because, forsooth, he should not compete with his brother architects for work there. But why not? The interests of the public would not suffer, because there is a special clause in the Act of Parliament dealing with such a case. There is every reason why he should, apart from that given by the opener, if he practise at all, and the Act clearly contemplates that he would—otherwise the clause would not be inserted. The whole discussion was very one-sided and hollow, and although it is desirable that the district surveyor should be an architect and a gentleman, these conditions are not unattainable outside the small section of the profession who meet at Conduit-street.—I am, &c.,

244, Camberwell-road. Ellis Marsland.

FIREPROOF CONSTRUCTION.

Sir,—Mr. Banks, writing on the above subject in your last issue, lays claim (by inference) to a principle of construction which did not originate with him. In the "Fawcett" floor patent (which is now nearly seven years old), the principles of *severance* and of the conducting *away* of heat are claimed, and the system has been carried out in its entirety in numerous buildings.

The Fawcett system was recently selected for the floors of the new buildings for the Institution of Civil Engineers (in competition with the "Banks" floor), and from the result it is evident that the Institution and their architect did not think any improvement had been made by Mr. Banks.—We are, &c.,

Mark Fawcett and Co.

50, Queen Anne's Gate, Westminster,

L.C.C. CONTRACTORS v. L.C.C. WORKS DEPARTMENT—A CHALLENGE.

Sir,—We have to-day written the Chairman of the London County Council as per copy below.

The matter being of great importance to the ratepayers of London, we shall be obliged if you will publish same.—We are, &c.,

Reed, Blight, and Co., Ltd.

Albany Buildings, 47, Victoria-street,
Westminster, S.W., Nov. 28.

[copy.]

Sir John Hutton,
Chairman of the London County Council,
Spring-gardens, London, S.W.

Sir,—Our attention has been drawn to some remarks made by Mr. John Burns at a special meeting of the London County Council on Thursday last. Mr. Burns is reported to have said that although the estimates of the Works Department of the L.C.C. had been exceeded in many instances, the Council had the satisfaction of knowing that the works executed by their Works Department were of a better quality than the works executed by the contractors under the old conditions.

The excess of the estimates we do not propose to discuss; but we consider Mr. Burns's statement as to the quality of the work not only misleading to the ratepayers of London, but absolutely devoid of foundation, and calculated to damage ourselves and other contractors.

We challenge proof of this statement, and would suggest that a committee of experts be at once appointed by the Council to verify it, in fairness to the contractors and ratepayers of London.

We give as specimens of the works executed by us the following:—The private lunatic asylum at Claybury, dynamo house and electric light station at Claybury, foundations for the artisans' dwellings at Yabsley-street, Poplar, and the artisans' dwellings known as Beachcroft Buildings, Brook-street, Limehouse, E.

If, in the opinion of the suggested committee of experts, these works are not equal in quality of materials and workmanship to works of a similar nature executed by the Works Department of the L.C.C., we are willing to hand over £50 to any hospital you may name.

We presume that—if you adopt our suggestion—the report of the said committee will be published, and as we consider the matter of great public interest, we are sending a copy of this letter to the Press.—We are, Sir, your obedient servants, Reed, Blight, and Co., Ltd.
(Signed) Per John Reed, Managing Director.

Intercommunication.

QUESTIONS.

[11257.]—**Infectious Hospitals.**—Can some of your readers kindly tell me one of the latest works or authorities on the planning requirements of an infectious diseases hospital?—Inquirer.

[11258.]—**Wall Sinking.**—How can I avoid the sinking of walls on clay ground?—J. M. P.

[11259.]—**Concrete.**—I have seen Portland cement concrete slabs 2ft. 3in. by 1ft. 9in. by 3in. thick, which were made about two years ago, and laid. In three months after, pieces about 9in. superficial, of irregular shapes, burst up. I have seen the same thing occur where floors were laid not as flags, but the material laid on small stones immediately after being mixed, then levelled, and finished off. The concrete in all cases was of the best Portland cement, and clean, hard gravel and sand as ground floors.—Builder.

[11260.]—**Strength of Floor.**—Can anyone oblige by showing method of calculating strength of a floor composed of wood joists 10in. by 2½in. at 18in. centres, and 10ft. clear between the beams? The beams are 40ft. long and of wood, 12in. by 12in., trussed with iron rods to similar beams in floor over.—A. Y. Z.

[11261.]—**Surveyors' Charges.**—In Ryde's scale of surveyors' fees for property taken compulsorily, what work is embraced in the charge?—A. Y. Z.

[11262.]—**Licenses.**—Is it necessary for an architect that is engaged by a private individual, and paid a stated salary annually, to have a valuer's license? Most of the works being paid for by measure and value, such prices being fixed solely by the said architect. Is it necessary for an architect to have a valuer's license for measuring and valuing builder's works for which he has, or has not, prepared the drawings and specifications, as the case may be?—Subscriber, Notts.

REPLIES.

[11247.]—**Architect's Duty.**—I was in hope someone would have replied more fully to the question as to an architect being justified in providing healthy adjuncts ahead of his employer's requirements, as I think it is an important one, seeing architects are frequently upbraided for not being abreast of the times, whereas it is the fault of clients, who will not go to the expense of improvements, and do not see the importance of their introduction until public opinion is so strong as to interfere with the letting of property that is not up to modern requirements; consequently it does not pay for a professional man to be ahead of what is needed of him, entailing, as it does, extra service out of all proportion to his ordinary duty of general supervision, in providing specialities which in many cases would not be appreciated, and in some instances jeopardise the work being proceeded with on account of the total cost exceeding amount proposed to be expended.—Progressionist.

[11253.]—**Ball-room Floors.**—I have made a portable dancing-floor for Lord Burton at the St. Paul's Institute, Burton-on-Trent, which has been used for the past ten years, and has given great satisfaction to many thousands of dancers, as it is used at all balls, on account of its springiness. It is of simple construction, and easily laid down, taken up, and stored away when not in use. The ball-floor is laid on an ordinary floor, and taken up and stored away when not needed for dancing. I shall be pleased to give "A.R.I.B.A." any information he may require, if he will write to—Wm. Gould, Builder, Tutbury.

Legal.

WHAT IS A "LEASE"?

THIS question came up in two cases that arose out of a dispute as to the Stamp Duties properly chargeable upon two documents which the parties sought to describe as "leases," and the Inland Revenue authorities contended were obligations or securities. In the first case, an agreement had been made between the Sweetmeat Automatic Company and the Great Western Railway as to placing a certain number of their machines upon various stations at an annual rental of £3,000. It was proposed to stamp this as a lease at 10s. per cent., which would be £15. But the Inland Revenue authorities argued that it was the only or primary security for the payment of the annuity of £3,000, and so came within the clauses as to a bond, covenant, or instrument given for that purpose, and must be stamped *ad valorem*, with a duty of 2s. 6d. for every £5, or part of £5, of such annuity. This raised the stamp duty payably to £75, and so the company appealed to a Divisional Court. In the other case, a similar point had to be decided. There the agreement was with a telephone company, giving the right to use a certain number of their lines at a *minimum* charge, making altogether a total annual payment of £506. It was proposed to regard this as rent, and stamp the document as a lease with £2 15s.; but the commissioner contended that it was really an instrument for the security of the payment of such an annual sum, and thus came within the same scale, and required to be stamped 2s. 6d. for each £5, or £12 15s.

Both cases were argued together (*Times*, Nov. 24), and in both the Inland Revenue authorities were successful. As to the telephones, the Court considered that the document could not be held to be a lease, as no exclusive possession was given in the wires, while the money was paid not only for the use of the wires, but also for services to be rendered by the Company. In the other case, as to the automatic machines, there was no exclusive right to any given piece or part of any platform, and so there could be no lease in the technical sense of the word as used in the Stamp Act. The result, however satisfactory to the Revenue, will hardly be so to other parties. It has generally been thought that the payment of rent for user of a place or thing in this way would create a lease of an easement, with stamp duties accordingly; but this ruling will greatly add to the expenses of such agreements.

Fred. Wetherfield, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

Nosyd.—Contract.—Material.—I think the best plan would be to give notice to determine the contract on grounds stated. The clause you mean applies to loose materials.

C. P.—Right of Way.—User.—Abandonment.—It may be that A. would be held to have abandoned the right of way by non-usage for so long a time. At all events, the lord of the manor is not liable, and A.'s remedy would be against B. But the case is one for legal advice, with deeds and plans.

Contract.—Defective Material.—Deduction.—It will be best to deduct the cost of making good, as suggested, from any money that is payable to the builder. He can, of course, object, and then the amount really due must be settled by arbitration under the contract, or by an action. He cannot be compelled to agree to the deduction, as seems to be supposed.

◆

Col. Hasted, Local Government Board inspector, held an inquiry at the Council Chamber, Rawtenstall, on Tuesday week, relative to the application of the Haslingden, Rawtenstall, and Bacup Outfall Sewerage Board for sanction to borrow £20,000 for the construction of a sewer. Mr. H. E. Cutler, engineer of the scheme, produced and explained the plans.

At a meeting of the Baths Committee, held at Bath on Friday, a new plan for dealing with the Roman bath and remains was submitted by Mr. J. M. Brydon, the architect. It showed the bath itself uncovered while the walls in York-street and on the east side of the bath would be lower than was originally intended. The plan, it was thought, would meet with the approbation of the Society of Antiquaries. The scheme for lengthening the promenade by 10ft. was agreed to. It was agreed that Mr. Brydon should prepare a perspective, and submit it before the matter was considered at a special meeting of the council.

LEGAL INTELLIGENCE.

Church Reseating at Crondall.—An Ecclesiastical Court was held at the Guildhall, Winchester, recently, before Mr. H. C. Gore Browne, M.A., Chancellor of the Diocese, to consider a petition from the vicar and churchwardens of Crondall, praying for the granting of a faculty approving and confirming the erection of a memorial brass on the north wall of the aisle of the parish church, and "certain slight alterations in the seating." The petition was opposed by Mr. J. Lindsay Johnson, a former churchwarden, and by other parishioners, on the ground that extensive and unnecessary alterations in the seating were proposed, including the rearrangement of three-fifths of the seats. The church was restored in 1871 by the late Sir Gilbert Scott. Mr. T. B. Colson, F.R.I.B.A., of the firm of T. Colson and Son, produced a plan of the church. The bench seats had been converted into pews, and the recent alterations had not been an improvement. Indeed, the obscuring from view the beautiful moulded base of a respond pier, of 12th-century work, was, he considered, an act of vandalism that should not be permitted to be perpetrated. Mr. Colson produced sketches showing how the new seat-framing and book-boards had been abutted against, and scribed to, the respond pier base. The Chancellor granted a faculty for the tablet, but adjourned the matter of the reseating till the parishioners could be consulted in vestry as to whether an alteration of the seats were necessary or not. He hoped that the opinion of an ecclesiastical architect would be taken about the reseating.

Re A. Braid and Co.—Under the failure of Alexander Braid, trading as a builder, at 112 and 113, Fore-street, City, under the style of A. Braid and Co., a summary has been issued. The unsecured debts are £6,483, and debts fully secured £71,736, and the debts are estimated at £10,381, subject to realisation. The debtor states that he has since 1889 been engaged in building operations in London, and during the last three years has incurred losses in connection therewith owing to his inability to let the premises; that his failure is attributable chiefly to losses on contracts undertaken by him, to claims against him for compensation for obstruction for light and air, and to law costs. A proposal has been lodged by the debtor for a composition of 7s. 6d. in the pound, payable in cash. The debtor appeared before Mr. Registrar Giffard on Wednesday, when the examination was closed.

The Architect and his Assistant.—The case of Elliot *v.* Clarke, on Saturday, came before Mr. Justice Collins, in the Queen's Bench Division, as a short cause, it being an action brought by Mr. Norman Elliot, of Hounslow, against Mr. Edward Clarke, an architect, formerly carrying on business at Dashwood House in the City, to recover arrears of salary from December, 1893, to the 17th October last, at the rate of 25s. a week. The defence was that the plaintiff left the defendant's employment in February last, when defendant got into financial difficulties, and was obliged to close his office. Mr. Sennhouse, in opening the case, said that when the defendant closed his offices at Dashwood House he told the plaintiff that as he intended opening new offices he need not look for any fresh situation, but continue to stop at home for a short time. This the plaintiff did until October last, always considering himself the defendant's servant. The plaintiff having given evidence in support of counsel's statement, Mr. Watt, on behalf of the defendant, said that the plaintiff left his client's service when he got into monetary difficulties in February last. Between February and August the defendant did not employ the plaintiff at all, but in the latter month, the defendant, having some work on at Edmonton Green, made the plaintiff clerk of the works, the plaintiff telling him that he had nothing to do, and would be glad to come on again. His lordship, in giving judgment, said that he felt compelled to adopt the story told by the defendant. He thought that the relation of clerk and employer ceased at the end of February, and the plaintiff was entitled to one month's wages, on account of the defendant having made a mistake as to the time the engagement ceased, he, at first, contending that it came to an end on January 24. That was clearly a mistake, and on that head there would be judgment for the plaintiff for £5, and another £2 for money expended by plaintiff in railway fares in going to and from London at different times when the defendant wished to see him. Judgment for the plaintiff for £7, but without costs.

Local Authorities and the Rejection of Plans.—Ex Parte Golding—in the Matter of the Swindon and Pendlebury Local Board.—An application was made to Mr. Baron Pollock and Mr. Justice Grantham in the Queen's Bench Division on Wednesday, on the part of a builder, near Manchester, for a mandamus to the Swinton and Pendlebury Local Board to approve of certain plans and sections for the building of certain houses on land of his which he had submitted to them, and which they had rejected without assigning any ground or reason. On November 12 last one Golding delivered to the board plans and sections for 49 cottages which he intended to erect. On November 24 he had a letter from the clerk of the board in these terms:—"I am instructed to return to you the plans and sections for 49 cottages, and to inform you that they are not approved of by the board." There was an affidavit of the applicant that the plans were in accordance with the Public Health Act, 1875, and the bylaws, and this was supported by the testimony of two architects. There was also an affidavit by the applicant that on several occasions he had asked the surveyor and the chairman and another member of the board to give the reason for the rejection of the plans, but had always been met by a refusal; and that on one occasion the surveyor told him that his instructions were not to disclose the reason why the plans had been rejected. On affidavits of these facts, Mr. Poland, Q.C., now moved for a mandamus to the board to make an order and stating their approval of the plans. He said there was already authority for such an application ("The Queen *v.* Newcastle-upon-Tyne"). The local board in such a case had not an arbitrary power of rejection of building plans without any real ground or reason; they could only reject plans on some specific and intelligible ground. And where, as in the present case, they refused to state the grounds and reasons on which they had proceeded, there was no remedy but such an application as the present. The Court granted a rule nisi for a mandamus.

Personal Liability of Receivers and Managers. — Burt, Bolton, and Haywood v. Bull and Ward.—This was an appeal from the judgment of Mr. Justice Mathew in favour of the plaintiffs at the trial of the action without a jury in July last. The action was to recover the balance of the price of timber supplied by the plaintiffs upon the order of the defendants, who were appointed receivers and managers by the Chancery Division in a debenture-holders' action. A company named Joseph Bull, Sons, and Co. (Limited) carried on business as builders and contractors, and the company had issued debentures. In 1892 a debenture-holders' action was brought, and on May 6, 1892, the defendant Bull and one Bird were appointed by the Chancery Division receivers and managers of the business of the company, with power to borrow £5,000. A creditors' petition to wind up the company was presented on May 14, 1892, but this petition stood over, and nothing was done under it. A committee of inspection on behalf of the unsecured creditors had been appointed, and it was arranged that second debentures should be issued to the unsecured creditors for their debts, and that one of the two receivers and managers should be appointed on their behalf. Accordingly the defendant Ward was appointed receiver and manager instead of Bird. The defendants ordered timber from the plaintiffs for the business, the order being signed in the following form:—"For Joseph Bull, Sons, and Co. (Limited), Ed. C. Bull, Robert James Ward, receivers and managers." Mr. Justice Mathew came to the conclusion that the defendants were personally liable, and gave judgment for the plaintiffs. Mr. Farwell, Q.C., for the defendant Bull, contended that the plaintiffs did not supply the timber on the personal liability of the defendants. They looked to the fund of £5,000 for payment, one of the partners in the plantiffs' firm being a member of the committee of inspection, and knowing all the circumstances. A manager appointed by the Court of Chancery was not bound to pledge his personal credit. The Court dismissed the appeal. The Master of the Rolls said that the first question was, what was the position of a person appointed by the Chancery Division receiver and manager of an existing business of, say, a company? He was not the agent of the company to carry on the business, and therefore the company would not be liable upon his contracts. Therefore, a receiver and manager so appointed giving orders for goods under such circumstances must be taken to do so on his own responsibility and to pledge his own credit. That was the position of a receiver and manager so appointed. But the receiver and manager might give an order for goods upon the express terms that he should not be personally liable, and if he chose he could do so. But if no such stipulation was made, and the only fact was that the order was given by him as receiver and manager appointed by the Court, the only inference to be drawn was that the receiver and manager pledged his personal credit, looking for an indemnity to the fund or business. If that were not so, every tradesman dealing with the receiver and manager would have to make inquiries as to the business or the fund. That seemed to have been the view of Sir George Jessel, M.R., in "Sargant v. Read," 1 Ch. D., 600, and of Mr. Justice Chitty in "Taylor v. Neate," 39 Ch. D., 538. The judgment was therefore right. The Lords Justices delivered judgment to the same effect.

Mr. Thomas Nelson MacLean, sculptor, died on Tuesday in last week from tumour on the brain.

Our Office Table.

An interesting feature at the meeting of the Society of Architects on Tuesday next, will be the exhibition of some rare and reference works in architecture. We understand that non-members of the society desirous of inspecting these books, and hearing Mr. Batsford's paper on them, and other works suitable for an architectural library, can obtain tickets of admission on application to the secretary at the offices of the society, at St. James' Hall, Piccadilly, W.

A meeting of the cement trade was held at the London Chamber of Commerce on Friday last, for the purpose of receiving and adopting or otherwise certain recommendations of the special committee which has been appointed to investigate and report upon the extent of the practice of admixtures with Portland cement, and as to the justifiability thereof. The trade, with only one dissentient, adopted the recommendation of the committee, that it was advisable that all manufacturers of Portland cement, who have used any outside material or materials in the manufacture of that article, should at once discontinue the practice. The use, however, of not more than 2 per cent. of gypsum, as practised by the German manufacturers for the purpose of regulating the setting of the cement, is considered optional.

Canon Lonsdale, who has been connected with Lichfield Cathedral for 39 years, gave a lecture in the chapter house of that cathedral on Tuesday, descriptive of the work done internally and externally to the fabric of the cathedral since the reopening in 1861. Canon Lonsdale spoke of the restoration of the west front, a work which occupied seven years, and was completed in 1884. He referred to the numerous memorials which had been placed in the cathedral in recent years, making special mention of the monuments erected to the memory of his father (Bishop Lonsdale), Dean Howard, Archdeacon Moore, and Archdeacon Iles, and to the memorial window and the colours of the 38th Regiment. After touching on the restoration of the great windows in the north and south transepts, he pointed out the improvements effected by the restoration of the central spire, which had now not only been beautified, but placed beyond danger.

The variation of barometric pressure has a very considerable effect on the ventilation of inclosed spaces like closets, cupboards, cellars, which have no large apertures, and for this reason the difference of air pressure is important in a hygenic sense. Professor Shaw says:—"A fall of pressure of 1in. causes the abstraction of 57c.in. of air from every cubic foot of the nearly closed space, and a rise of internal temperature of 1° Fahr. causes the expulsion of 3½c.in. Changes of air are thus effected in wells, cupboards, cases, cellars, cesspools, and the same causes produce an expulsion of air from all soils which are porous, and contain a quantity of air dependent on the barometric pressure." These facts are important to the architect and hygienist. Natural ventilation is, according to this law, continually in operation with every change of pressure and temperature; there is a constant change of inspiration and expiration going on in every closed room and space in a building or in the soil. A fall of pressure in the case of soil underneath a house, will cause the gases in the soil, often noxious, to enter the building, to which cause we probably owe much ill health.

A Roman villa has just been discovered at Darenth, in Kent. Many Roman tiles were noticed on the surface of a field beside the river to the south of the church. Tentative diggings were made, with the result that at about a foot below the surface remains of Roman foundations were met with. Mr. George Payne, of Rochester, was invited to superintend the excavations, which are now proceeding under his direction. The foundations have been opened out of a quadrangular building, with its outer walls made of flint nodules set in mortar, and faced with plaster, the walls measuring usually 2ft. or more in thickness. The inner walls are less substantial, and in some cases were left hollow in the middle, while at the floor level each wall had a plaster moulding, concealing the angle formed by the floor and the wall. The floors of two of the rooms are paved with tesseræ of red brick, still in a good state of preservation. Of the other rooms, one still has its flooring of square red tiles about 8in. in diameter, and in others traces remain. Along the north front is a row of five chambers of various widths, but all of the same length north and south—viz., about 27ft. The largest is nearly square, the next about 18ft. in width, and the three others from 6ft. to 9ft. wide. Beyond these, on the east, is a room about 6ft. square, and other foundations exist in this direction. On the western side of this range of rooms is a large hall, having a width of 17ft., and a length not yet determined. Abutting on the outer wall of this hall is the bath. Very few small antiquities have been found: some fragments of bronze armlets, chains, a so-called hippo-sandal, and a small coin of Tetricus; but broken pottery is found in abundance.

Johannesburg is progressing by leaps and strides as great as those which have marked the rise and development of cities in the United States. Mr. G. S. Burt Andrews, writing to the Society of Architects from the Government Offices at Johannesburg, says:—"To give you some idea of the rapid way in which the town is *still* growing—for the *week* ending 26th October no less than thirty-one sets of plans were submitted to this department for approval, representing a value of about £35,000—the average number of plans sent in *per week* since the commencement of this year is 19·45.

CHIPS.

Mr. Walter Freeth, ex-student of the Central Municipal School of Birmingham, and at present master of the Moseley-road Branch School of Art, has been appointed to the head mastership of the Watford School of Art.

The Perpendicular canopy and altar-tomb that were erected some time since in York Minster, as a memorial to Dr. Thomson, will soon be completed by the addition of the sculptured effigy of the late archbishop, which has been executed by Mr. Thorneycroft, R.A. The unveiling will take place in January next.

Museum Sunday was celebrated on Sunday in London and several of the provincial towns. Altogether, 54 sermons and ten addresses were delivered in support of the objects of the Sunday Society, and eight special art exhibitions and 85 rate-supported museums and galleries were open free to the public.

John M'Dermott, 45, local secretary of the Amalgamated Builders' Labourers' Union, was remanded at Leeds, on Friday, on a charge of embezzling £129, the money of the union. A month ago, prisoner, it is alleged, absconded, sailing from Liverpool in the *Campania* for New York, where he was followed, arrested, and brought back by a Leeds detective.

The local board of Stapleton, near Bristol, have adopted plans by Mr. A. J. Saise, their surveyor, for sewering the Ashley Down district, at an estimated cost of £7,000.

At St. Mary's Church, Hunslet, Archdeacon Bardsley, Vicar of Bradford, unveiled, on Friday, the Leake memorial reredos, which has just been erected at a cost of £500, and also an oak Communion table. The centre panel of the reredos depicts the scene at Emmaus, where Christ broke the bread to His disciples. The designer was the Rev. E. Geldart, vicar of Little Braxted, Witham, and the work was executed by Mr. Malster, late of the firm of Cox, Buckley, and Co., of London. The tiling is by the Leeds Marble Tiling Company.

The Anglesey and Carnarvonshire Infirmary, which has been practically rebuilt from the designs of Mr. P. S. Gregory, Bangor, was reopened on Saturday by Mrs. Davies, wife of the lord-lieutenant of Anglesey.

At the Royal Institution, Mr. Lewis F. Day will deliver, in the spring, three lectures on "Stained Glass Windows and Painted Glass" from the point of view of art and craftsmanship.

On Saturday a dedication service was held at St. Chad's Church, Far Headingly, in connection with the new Home which has been erected in Hollin-road by the Ripon and Wakefield Branch of the Church of England Incorporated Society for Providing Homes for Waifs and Strays. The architect of the home is Mr. W. A. Hobson, of Albion-street, Leeds. In the large hall facing the entrance porch stands a fine old oak chimney-piece, which Mr. E. W. Beckett, M.P., removed from Kirkstall Grange for the purpose of decorating the Home.

At the Exeter Police-court, on Monday, William T. Webber, an apprentice to the carpentering, was summoned by his employers, Messrs. Hems and Son, of Longbrook-street, who applied for an order compelling him to perform his duties according to the indenture of apprenticeship. Evidence having been given to show that the lad was idle, the order applied for was made.

MEETINGS FOR THE ENSUING WEEK.

To-Morrow (Saturday). London and Provincial Association of Builders' Foremen. Half-yearly meeting at the Memorial Hall, Farringdon-street, E.C. 7.30 p.m.

Monday.—Surveyors' Institution. "The Burdens on Real Property and Land," by William Sturge, Past President. 8 p.m.

Tuesday.—Society of Architects. "Rare and Reference Books on Architecture, with Hints on the Formation of an Architectural Library," by Herbert T. Batsford; and "Students' Manuals," by G. A. T. Middleton. 8 p.m.
Institution of Civil Engineers. "Colliery Surface Works," by E. B. Wain. 8 p.m.

Wednesday.—Society of Engineers. Annual Dinner.
Society of Arts. "Manufacture of Salt." 8 p.m.
Sanitary Institute. Discussion on "The Sanitary Aspects of the London Building Act, 1894."
St. Paul's Ecclesiological Society. Meeting for exhibition of objects of Ecclesiological Interest. St. Paul's Chapter House, E.C. 7.30 p.m.

◆

The Society of Architects.

Founded 1884. Incorporated 1893.

The THIRD ORDINARY MEETING of the Society of Architects for the Session 1894-5 will be held at the Rooms of the Society, at St. James's Hall, Piccadilly, W., on TUESDAY, December 11th, at Eight o'clock p.m., when a Paper will be read by Mr. HERBERT BATSFORD, entitled: "RARE AND REFERENCE BOOKS IN ARCHITECTURE, WITH HINTS ON THE FORMATION OF AN ARCHITECTURAL LIBRARY," when a number of rare and valuable books will be exhibited to the members. A short Paper will also be read by Mr. G. A. T. MIDDLETON, A.R.I.B.A., on "STUDENTS' MANUALS."

ELLIS MARSLAND, Hon. Sec.
A. MONTEFIORE, Sec.

WATER SUPPLY AND SANITARY MATTERS.

Easingwold.—Mr. G. W. Willcocks, an inspector under the Local Government Board, held an inquiry at the Town-hall, Easingwold, on Friday, the sanitary authority of the rural sanitary district of the Easingwold union having applied to the Local Government Board for sanction to borrow £2,725 for works of sewerage and sewage disposal for the township. Mr. Fairbank, of the firm of Fairbank and Son, C.E., York and Westminster, attended with the plans and estimates, comprising a system of drainage for the whole town. It is proposed to construct a public sewer, commencing at the union workhouse in Oulston-road and ending in Stillington-lane. The outfall works will be in a field adjoining, and filter beds will be constructed.

Lewes.—A Local Government Board inquiry was held here last week by Colonel Walter Mardon Ducat, R.E., *re* the application of the Lewes town council to borrow £2,000 for works of sewerage. The plans were explained by Mr. Thomas William Franks, A.M.I.C.E., the borough surveyor, who afterwards, in company with the town clerk, walked over the ground with the inspector.

◆

Miss Hull, daughter of an architect and surveyor at Northampton, was presented on Monday with a certificate of the Royal Humane Society and congratulated by the Mayor and ex-Mayor on her courageous conduct in saving another lady, and escape from drowning at Kessingland last August.

Among those elected as Associates at Tuesday's meeting of the Institution of Civil Engineers was Mr. Charles Barry, F.S.A., F.R.I.B.A., Westminster.

The London and Provincial Builders' Foremen's Association's half-yearly meeting takes place on Saturday, Dec. 8, at the Memorial Hall, Farringdon-road, E.C., at 7.30 p.m.

Extensive alterations have lately been made at the premises of the Leicestershire Banking Company, High-street, Melton Mowbray, under the superintendence of Messrs. Goddard, Paget, and Goddard, architects, of Leicester. The contractor was Mr. J. J. Fast, of Melton Mowbray.

The Duke of Norfolk is restoring the ruins of the historic old castle at Clun, Salop, which he recently purchased. His grace now owns 40 acres surrounding the castle, as well as the residence known as Clun Cottage.

A paper on "The Modern Theatre of the Continent" will be read before the Architectural Association by Mr. Edwin O. Sachs, of Waterloo-place, S.W., this (Friday) evening. Among those who have promised to attend, to express their views on the subject, are Sir Augustus Harris, Drury-lane Theatre; Mr. Mulholland, Camberwell Theatre; Mr. John Hollingshead, late Gaiety Theatre; Mr. Graydon, Middlesex Music Hall; Mr. Clement Scott, Mr. Richard Roberts, L.C.C., chairman, and Mr. Leon, L.C.C., member of the Theatres Committee, County Council; Mr. Thomas Blashill, F.S.A., architect to the County Council; Mr. C. J. Phipps, F.S.A., and several officers of the Metropolitan Fire Brigade.

Trade News.

WAGES MOVEMENTS.

Pontypridd.—The master builders of Pontypridd have served notices upon the masons in their employ to terminate the present agreement, the employers wishing to abolish "walking time," and to have the right to import dressed stone into the town.

◆

CHIPS.

Wednesday last having been the anniversary of the birth, in 1717, of Johann Joachim Winckelmann, the archæologist, Herr Dörpfeld, the Director of the German Archæological College at Athens, delivered an address before a large audience in that city, in which he detailed the sacrifices made by the German Emperor and Government on behalf of the Institute and the researches at Troy and Issarlik, and paid a tribute to the great services of the late Professor Curtius.

The War Department have decided to proceed at once with the erection of a station hospital and accessory buildings at Shorncliffe Camp. The work will be carried out by private contract, a tender having been accepted, and it is understood the cost will amount to nearly £30,000.

To perpetuate the memory of the late Major-General Fitzroy Fremantle, C.B., a tablet of white statuary marble has been erected in the south aisle of Exeter Cathedral. The tablet is the work of Messrs. Harry Hems and Sons, Exeter.

A pulpit erected in St. Andrew's Episcopal Church, Brechin, as a memorial of the late Dean Crabb, was unveiled on Friday. It is octagonal on plan, and consists in the main of Painswick stone, with shafts of Kilkenny marble. The central panel is occupied by a figure of Our Lord as the Good Shepherd, and in side niches are figures of St. Andrew and St. Ninian. Messrs. Ross and Macbeth, of Inverness, were the architects, and Messrs. Harry Hems and Sons, of Exeter, the sculptors.

The monthly report for December of the Amalgamated Society of Carpenters and Joiners, just issued by the secretary, Mr. F. Chandler, states that, notwithstanding the depressed state of affairs in the industrial world, substantial progress has been made, inasmuch as the society have opened during the year over 40 branches, and close with nearly 44,000 members, the increase during the past six years being upwards of 19,000.

At the meeting of the Society of Engineers, held at the town hall, Westminster, on Monday evening, Mr. George A. Goodwin, president, in the chair, a paper was read by Mr. H. B. Ransom on "The Principles and Practice of Hydro-Extraction."

A Local Government Board inquiry was held at the town hall, Birkenhead, on Friday, by Mr. Rienzi Walton, M.Inst.C.E., into an application by the Birkenhead Town Council for sanction to borrow £35,000, of which sum £20,000 was for electric-lighting purposes, £10,000 for works of street improvement and sewerage and for fencing in the Bridge-street depot, and £5,000 for the erection of a fire-station and for the provision of a steam fire-engine and fire appliances. Mr. Shoolbred, electric engineer, and Mr. Richardson, water engineer, explained the schemes.

For fittings—			
Meller (accepted)	£101	0	0

London, W.—For remodelling 57, Berners-street, W. Mr. Delissa Joseph, F.R.I.B.A., 17 and 18, Basinghall-street, E.C., architect:—

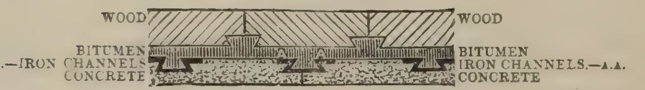
Hanks, H. (accepted)	£1,925	18	0

14 GOLD MEDALS. HIGHEST AWARD, CHICAGO EXHIBITION, 1893, FOR "INGENUITY AND EFFICIENCY" OF EBNER'S FLOORS. 14 GOLD MEDALS.

Ebner's Patent Hydrofuge Wood Block Floors.

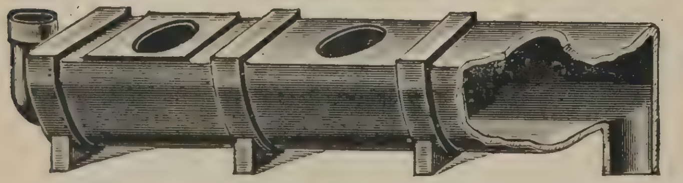
Telegraphic Address:
EBNERS, LONDON.

Code: UNICODE.

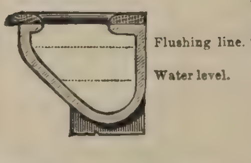


INSPECTION OF SHOW ROOMS INVITED.

ANY WOOD OR DESIGN USED.
JOS. F. EBNER'S PARQUET FLOORS, ANY THICKNESS OR DESIGN.
JOS. F. EBNER'S ROMAN AND VENETIAN MARBLE AND GLASS MOSAIC PAVING.
JOS. F. EBNER'S IMPROVED MARBLE TERRAZZO PAVING. ARTISTIC, CHEAP, AND DURABLE.
COMPARISON OF QUALITY AND PRICE INVITED. ESTIMATES FREE.
MANUFACTORY: 150, OLD STREET, ST. LUKE'S, LONDON, E.C.



Section of Trough.



MERRILL'S PATENT TROUGH CLOSET.

Greatest Cleanliness, with least Consumption of Water.

Vide Sheffield Corporation Report on Automatic Flushing Closets.

"The form of trough which undoubtedly seems to us to be most favourable to a good flush is a triangular one, as exemplified in the two examples of the Water Carriage Engineering Co. By adopting this form a minimum quantity of water reaches a maximum amount of surface; or, in other words, with the same volume of water as in the other forms less surface liable to be soiled remains unaffected by the flush."—Report by Mr. G. Alsing, A.M.I.C.E., and Dr. Harvey Littlejohn, Medical Officer of Health.

FRIDAY, DECEMBER 14, 1894.

COMPILERS AND COPYISTS.

As there are good copies and bad originals, so we may take it that we can have a compilation of more merit than any work which pretends to be absolutely new. One of the maxims of Rochefoucault is that "the only good copies are those which point out the ridicule of bad originals"; at least, it is possible that the literary as well as architectural eclectic may, by improving on the works of original authors and buildings by correcting their mistakes, attain to a degree of eminence which even the original authors failed to reach. It has been so in literature, and so it has been in architecture. The architects of the Parthenon improved on the Doric temples of Corinth and Ægina; the builders of Salisbury Cathedral improved on the architecture of the preceding periods, if not on what had been done at Lincoln, and perhaps, also, at Lichfield, all three of which churches were being proceeded with at about the same period.

Between a literary and an architectural compilation there is this difference: that in the former the compiler or author puts together truths or facts bearing upon a particular subject—he collects materials to suit his purpose with some connection and meaning; but in the latter he collects, but does not always seek connection or adaptation. It is true we have flippant and loose compilations on various themes, and it is in this sense both kinds of compositions agree. A compiler frames a composition from various authors, but the ordinary architect this way inclined often merely frames a collection, disjointed and scrappy, from various sources, which is a very different thing. We need not carry the analogy between the two sorts of compilers any further, but proceed to show in what way the architectural compilation is more desirable than a poor copy, and how often it may be mistaken for a genuine original. In one sense it will, of course, be said that all architectural design is more or less a compilation of ideas: no man can invent entirely new plans or new external features; they must be developments or growths of older types. Perfectly true, but it is not in this sense we are discussing the question, but in the more ordinary meaning of collecting or piecing together examples of this or that building, Mr. A.'s, Mr. B.'s, and Mr. C.'s work. To very few is given the ability to digest or, so to speak, assimilate in the crucible of their own mind, the elements of architecture—to turn to their own use and embody in their own design the common language of all ages, to extract the principles on which old styles have been based, and apply them to modern wants.

The worst kind of compilation is when a whole part of one building or one design is taken and bodily pieced on to another and totally unrelated design;—when we see the west front of St. Paul's, towers and all, tacked on to a corn exchange or town hall; or a portion of Mr. Norman Shaw's design for a country domestic building filched away from its connection, and made a façade in a street. The bare-faced and impudent prig who quotes whole passages without acknowledgement is scarcely worse than one who steals outright a window, or door, or a tower from a building, and places it in connection with other misquoted features from other edifices. Of course, such work is "making" architecture quickly, like "making" books: it may look all right and imposing enough to minds which have not learned to criticise; but it is not genuine design, and is often less logical than a copy of a good building, which may, at least, be consistent throughout. The force of imitation is often stronger than discrimination. Like those who cannot avoid imitating bad examples, so we find men who take questionable and bad copies of buildings. Thus we see so many travestied copies of pieces taken at random from our buildings. Very often these selections are from the works of second and third-rate men—copies of copies. Like authors who quote from secondhand sources, these architects introduce features which have lost their original significance. Let us make our meaning clearer. A. designs an elevation that is the result of an artistic, thoughtful study of plan for its particular destination—say, a town hall; B. borrows the same features for a city warehouse; C. copies B. for a similar, or other purpose. In this manner we get a series of copies which lose something the farther the original is departed from. What was right in the case of A. cannot be in the case of B. or C. There is no selective or discriminative choice in such cases of compilation. A gable or bay of a house, designed by an artist in "Queen Anne" or the Renaissance, is tacked on a secular building for a commercial purpose; the original, designed for a rural locality, is transported into a street façade. These ludicrous transpositions are intensely aggravating when the author has repeated every detail of the original, even to the mouldings and ornament, and has placed them in juxtaposition with other parts which have no congruity with it. We see these ill-assorted combinations every day: they shock us as much for the want of common sense and discrimination they exhibit as for their lack of congruity and harmony. The building in the street, and the suburban villa, and the new vestry-hall or free library are compilations of this sort, made of scraps lumped together. It is a quick way of designing, and saves hours of study and thought to put together bits of design by Bodley or Pearson, Norman Shaw, George and Peto, Graham Jackson, and other authorities in the styles of the day.

But there is discriminating as well as thoughtless compilation. To give an example. An architect, who is about to design a set of municipal offices, a fever hospital, or public baths, takes down the volumes of his Building News for examples of such a building. He closely studies the plans of several to find out the points which he may have overlooked. He perhaps finds one plan that suits his purpose or the shape of the land, and, without slavishly copying, he appropriates to his purpose those points which appear to suit him best. He refers to another plan and appropriates something from it, and he tries, in short, to adapt to his purpose the features of several. It is this kind of compilation which is very commonly practised among architects both old and young; but they do nothing more reprehensible than hundreds of book or treatise compilers do, who consult a number of authorities in a public library. It is simply reference. The architect who consults a few of the best plans for hints or suggestions is making simply a reference to what has been done, not with the intention of copying, but of seeing what others have done before. And such reference is as justifiable as it is for an expert in the construction of hospitals to refresh his mind by looking over his notes and any drawings or types he may have by him. We should blame any professional man for not equipping himself with the most recent facts or information, and an architect would be equally wrong were he to neglect to furnish his mind by referring to the most approved and recent examples of arrangement. But there are others who are more unscrupulous. They are expert cribs; they do not hesitate to copy line for line a plan which they think suitable, or a portion of one, as a hall or an elevation, and the expertness and cleverness which they exercise is truly often creditable to their faculty for appropriating others' skill. To do them justice, they often show much discrimination and good sense in selecting the best they can for their purpose. And it is this class of compilers who are often so insidious and successful in their profession; they never omit to watch their opportunities for pilfering; they make up a large class of practitioners of the "all round" and business description, who have neither time nor inclination to solve problems or to study architectural detail for themselves. There are prigs whose reliance upon others lead them into pitiable mistakes, as when a man copies a wrong type of plan for a given purpose, or a bad original. These men become either travestiers or downright botchers, such as we find among literary men, and especially playwrights, who make a nonsensical plot or caricature out of two or three other plays. We have also our plagiarists of architecture, caricaturists of architectural features and styles, whose parodies of leading buildings are often ridiculous. Pope says "the proper study of mankind is man," and we may paraphrase the aphorism by saying the proper study of architecture is buildings. Sketching old work is one of the methods which the judicious compiler may safely rely upon. But he should not be content simply to draw old buildings; he should regard them as the solution of problems, and take as much trouble to solve the problems of our own day. Intelligent and discriminative compilation requires a thorough and comprehensive knowledge of all the requirements, ancient as well as modern. The modern compiler is too often satisfied with a superficial choice; he takes a favourite author or artist, without examining the grounds or motives which have induced him to write or design in a certain way. A little more extensive acquaintance with the subject would have led him to go back to the original source, and to have discovered the reasons or principles which his original author took for his guidance. The modern copyist seldom goes behind his original, and therefore he is betrayed into imitating the defects and mannerisms of the author's style. He is apt to copy all the vices as well as strong points, and it is this slavish adherence to the text of the original which makes his work so ludicrous. What was simply a misjudgment on the part of the original author, becomes an unredeemed folly on the part of the plagiarist, submitting him to all the reproaches and lampoonings of successive generations. We see none of this in the old work. Errors of vaulting were corrected by successive architects; the cruder and less perfect forms of details, like the pillar-section and arch-moulds of our Norman Transitional churches, were by degrees amended by the Early English architects; and so it was everywhere, where the true system of growth or compilation was in operation. The competent author of a treatise is not contented till he goes through the various editions of the leading authorities—he never quotes a text from a translation or from a pirated edition; so the architect who is compelled to take his facts from existing buildings ought never to rest satisfied till he has taken the trouble to find out where their authors have unwarily tripped.

THE LONDON BUILDING ACT AND ITS CRITICS.

Exponents of the new London Building Act are beginning to appear. Two classes of commentators are dealing with the subject. First, those who simply annotate the Act as it stands, with notes interpreting certain provisions; and, second, those who are mainly engaged in giving the probable results of the new legislation as it affects building in London, and in criticising the provisions of the Act. From this latter party comes the useful exposition of the Act we gave in our two last issues by Mr. Ellis Marsland, the hon. sec. of the Society of Architects and district surveyor for Camberwell. As we have given lately a pretty full summary of the new Act, it will be unnecessary to go over the ground again. As an Act of consolidation, we have much to be thankful for, though we cannot say that it is perfect. The opponents of the Bill have reason to be satisfied; but others who have been looking for a more complete measure, and for improved hygienic conditions of buildings in the Metropolis, have been rather disappointed.

The paper to which we refer our readers deals mainly with the more important of the variations from the old law. Mr. Marsland points out a few of the sections which are likely to give rise to difficulties in their administration, to some of which we may briefly refer. Alterations or additions to old buildings are dealt with under Section 209. It will be less easy than before for any owner or builder to evade the requirements that are enacted, except in those cases where "necessary repair not affecting the construction of any external or party-wall" are concerned. The definition of "public building" being enlarged so as to include hotels, lodging-houses, homes, and shelters, "where such building extends to more than 250,000c.ft., or has sleeping accommodation for more than 100 persons," it will be often difficult for a district surveyor to determine whether a lodging-house or hotel has passed beyond the limit provided (namely, 100 persons), and must have fire-resisting materials. If the building has only sleeping accommodation for 100 persons, the corridors, passages, and landings and flights of stairs may be simply of wood; but if an additional bed be included, the building construction has to be completely altered. On this nice point a discretion will have to be exercised, and Section 79, which deals with the conversion of buildings or houses into public buildings, appears to confer such a power, for it enacts that in such a conversion the walls, roofs, floors, galleries, and staircases shall be constructed in such a manner as may be approved by the district surveyor, or determined by the Tribunal of Appeal. Obviously, however, there will be questions often arising when a lodging-house for 100 beds is made to accommodate any additional beds, and the district surveyor will have to make periodical visits with the object of finding out this point, and all others where exempted buildings are no longer privileged. Under Part II. various grounds are stated upon which the Council may refuse to sanction any new roads or streets. Some of these appear excellent grounds, and we have always protested against the making of unnecessary roads simply for the purpose of increasing ground-rents.

Mr. Marsland summarises usefully the provisions for open space, light, and air about buildings under Parts V. and VI. The clauses are, no doubt, a little complicated, and have to be studied somewhat carefully. We have three cases stated—first, when the open space is to be provided for a new building in a new road; second, when it is for a new building abutting upon an old road; and thirdly, when the open space is for an old building upon an old road. Besides the 100ft. square to be provided in each case to any habitable basement, an additional space in rear is required of 150sq.ft., and this space may be obtained over the ground story if the latter is not inhabited. This space is to extend laterally, and to a depth in every part of 10ft. at least. This last allowance of 150ft. square appears inadequate, especially so, when it only commences at the ceiling-level of the ground-floor story, or 16ft. above pavement level, a point which is made very clear in Mr. Marsland's diagram we gave last week, which illustrates in a practical manner the effect of the angle described in the Act (Sect. 41), to determine the height of building in relation to the space in the rear. It will be seen by looking at this section that the diagonal lines drawn from the ground story ceiling level 16ft. high will allow a considerable additional height and obstruction to light and air. The exceptional cases noticed in the last part of this section are open to objection, inasmuch as the Council has to be consulted in every case. It would have been wiser, as we have before said, to have adopted the angle of 45° instead of the one introduced, 63½°, which is an angle less intelligible, and which does little to improve the existing state of our buildings.

Another portion of the Act, Section 45, relating to courts within a building, is also open to misunderstanding as to what is intended. In the first place, the clause is not so explicit as it might have been, as, for instance, where it says "that the depth of such court from the eaves or top of parapet to the ceiling of the ground story exceeds the length or breadth of such court, adequate ventilation of such court shall be made and maintained, &c." Why not define the depth more exactly than by saying the "length *or* breadth of such court"? Which is intended? The words "adequate provision" is, as Mr. Marsland observes, vague, and who is to interpret what is adequate ventilation? Again, the clause, which runs, "Provided that a court, of which the greater dimension does not exceed twice the less dimension, shall be held to comply with this section, if a court of the same area, but square in shape, would comply therewith." To say the least, this is a rather involved sentence. Section 74 is important to owners and large tradesmen. It enacts that, in every building exceeding ten squares (1,000sq.ft.), used partly for trade or manufacture and partly as a dwelling, the former part is to be separated from the latter by walls and floors constructed of fire-resisting materials, and all passages, staircases, and approaches to the dwelling are to be constructed throughout of fire-resisting materials. It is not very clear, however, as pointed out, whether, in case the trade part is extended to more than 250,000c.ft.—which extension brings it under the warehouse class—the doorways in the walls of staircases and passages between the two separate parts are to have fire-resisting doors.

The facilities afforded by the new Act in respect of bay windows and oriel projections are such that these structures may now be erected without the sanction of the Council. There are definite rules and limits in Section 73 which have to be complied with, and which will save much time in making applications. Under Section 65, a furnace chimney may be carried up, provided it tapers gradually at the rate of at least 2½in. in 10ft., and that its thickness for 20ft. below the top shall be at least 8½in., increased by half a brick for every additional 20ft. measured downwards; that it has proper footings, which are stated. So also a bay window may be erected beyond the frontage line in a street 40ft. wide, if it does not exceed three stories in height, and does not project more than 3ft. from the main wall of the building, or within the prescribed distance of the centre of roadway, &c. Oriel windows or turrets may also be built under limitations set forth in Section 73. Other facilities are to be found in Part VIII., which deals with the rights of building and adjoining owners. Section 87, in its several clauses, gives specific rules which, if followed, will avoid much trouble and litigation. The diagrams showing inclinations of roof and those illustrating the schedule of thickness of walls in our last issue are instructive.

THE SOCIETY OF ARCHITECTS.

THE third fortnightly meeting of the Society of Architects was held on Tuesday evening at St. James's Hall, Piccadilly, S.W., the President, Mr. E. J. Hamilton, in the chair. Mr. W. H. Bridgman, 67, Fleet-street, Torquay, and Mr. Benjamin R. Tucker, 23, Sisters-avenue, Clapham Common, S.W., were elected as members.

THE LATE MR. H. A. K. GRIBBLE.

Mr. E. J. **Kibblewhite** proposed a vote of condolence with the widow and family of the late Mr. Herbert Gribble, the architect of the Brompton Oratory, whose brilliant career had been terminated by his sudden death on Saturday last at the comparatively early age of 47 years. Having sketched his career, Mr. Kibblewhite referred to Mr. Gribble's great powers of design and excellent draughtsmanship, and observed that he was well known in that room as a member of the Architects' Registration Committee, a movement which had his warm sympathy and support. He had that morning received a letter from Mr. H. Roumieu Gough, their past president, expressing his deep regret at Mr. Gribble's death.

Mr. **Edgar Farman**, in seconding the motion, bore testimony to the valuable aid Mr. Gribble rendered on the Architects' Registration Committee, of which he was a staunch adherent.

Mr. **William Allport** and Mr. W. **Woodward** supported the motion, the latter referring to the grasp of planning, the skilful treatment and richness of detail displayed in the Oratory at Brompton. By his death they had lost a genial and good-natured man, and an able and distinguished architect.

The vote of condolence was passed in silence.

RARE AND REFERENCE BOOKS ON ARCHITECTURE, WITH HINTS ON THE FORMATION OF AN ARCHITECTURAL LIBRARY.

Mr. **Herbert Batsford** read a paper on this subject. The lecture was illustrated by a very large display of rare and sumptuous works on architecture. He observed: I intend to start upon some such—shall I say improbable?—hypothesis as that of an architectural society desirous of forming a good reference library of architectural books, had asked my advice as to which, assuming reasonable means, they should proceed to acquire. I shall enumerate to you most of the books which, in my opinion, should be in such a library, and shall make the briefest possible comments upon some of them. My object will be to speak chiefly of those books which, in my judgment, are essential to the formation of a reference library upon architecture and the closely-allied art of decoration. I must assure you that on this occasion I am representing also my father and brother, of whose wide knowledge and long experience I have had the full advantage. If I were asked to define in general terms what kind of books I thought essential to such a library as we are about to consider, I should reply, All such books as a student might reasonably be expected to consult in his architectural studies, or to which an architect might have occasion to refer in the course of his practice; and first amongst them one would naturally place such works as dictionaries, cyclopædias, general histories, journals, and other serial publications pertaining to or illustrating the subject. Then I think there should be found one, at least, of the most authoritative and important works illustrating each of the various historic styles or periods of architecture in all countries, amongst which I would include important monographs upon some of the most remarkable edifices in the world. Next may be considered a class of works by no means so numerous as it might be—that devoted to public buildings and institutions, such as theatres, hospitals, markets, and other municipal buildings, to which I would add some examples at least of the works of contemporary architects at home and abroad. Beyond these there remains the important subject of practical construction, sanitation, &c., &c. There are, too, a few architectural biographies, and I would recommend any public library to acquire them all, for nothing, I think, could be more inspiriting to a student than to read the memoirs of Pugin, Barry, Scott, and the other great professors of their art. Milizia's "Lives of the Celebrated Architects" up to the end of the 18th century, translated by Mrs. Edward Cresy, should certainly be included amongst these. I will now proceed to lay before you my list of books. First amongst the "special books of reference" I have placed that remarkable work the "Dictionary of Architecture," published by the Architectural Publication Society, and which was completed chiefly under the able and untiring editorship of the late Mr. Wyatt Papworth and the fostering care of Mr. Arthur Cates, who remained true to his post of honorary secretary, from its inception to its completion. Professor Roger Smith, in a recent lecture delivered at the University College on “Discoveries in Architecture,” spoke of it as a book bristling with signposts, calculated to “direct the student in his search of knowledge to the best sources of information.” He said also that “in all the articles the most copious list of references occur,” and that “it is of the greatest use to a student to have sources of information so liberally spread before his view.” After this I need only add that the book contains 2,300 folio pages of text, and some 250 plates, besides other illustrations in the text. I am sure the next book you expect me to mention is “Gwilt’s Encyclopædia of Architecture,” and the mere mention of it will be sufficient. With “Gwilt’s Encyclopædia” I am disposed to bracket Parker’s “Glossary of Terms used (particularly) in Gothic Architecture,” three volumes, 8vo., the illustrations of which are delightfully drawn and engraved. There are two exceedingly good dictionaries which are not, I think, so well known in this country as they deserve to be; they are Bosc’s “Dictionnaire Raisonné d’Architecture,” four volumes, with 4,000 illustrations, and Chabat’s “Dictionnaire des Termes employés dans la Construction,” the most comprehensive dictionary of terms used in construction extant. Amongst “reference books” I should also include the following:—D’Agincourt’s well-known “History of Art by its Monuments,” which has over 3,000 small illustrations, and the English edition of which was edited by Owen Jones; Fergusson’s “History of Architecture,” now in five volumes, which needs no comment of mine; Gailhabaud’s “Monuments Anciens et Modernes,” a work which illustrates, on 400 steel plates, a large number of the principal buildings of all ages, in a clear and correct manner. I almost hesitate to include in this class Viollet-le-Duc’s celebrated books, “Dictionnaire de l’Architecture, Français du X. au XIV. siècle,” “Dictionnaire du Mobilier Français,” for, although they are entitled “Dictionnaires,” they are really something more, and the same may be said of Havard’s “Dictionnaire de l’Ameublement et de la Decoration”; of these I shall have something further to say later on. Some of the finest works ever produced have been devoted to ancient art in Egypt and Western Asia, notably that of Champollion, “Monuments de l’Egypt, et de la Nubie,” four volumes, folio; that known as “Napoleon’s Egypt,” being the result of an expedition sent out by him (Napoleon I.), twenty-one volumes, folio; and that of Von Lepsius, in twelve volumes, the result of a similar expedition aided by the King of Prussia; but the latest important work upon Egypt is that of Prisse d’Avennes, which is confined to architecture and the auxiliary arts, and if either of these large works be necessary in our library I should give preference to it, although, I believe, Egyptologists prefer one or other of the older works. I must just mention here the valuable work, “Monuments of Nineveh,” by the late Sir Austen H. Layard, published in 1849-53, and the more recent French work, “Monuments de Ninève et l’Assyrie,” by Victor Place, three volumes, folio; and the Comte De Vogué’s work in two volumes, entitled “L’Architecture dans la Syrie Centrale.” I am, however, disposed to think that the handy series of volumes produced by those zealous Frenchmen, MM. Perrot and Chipiez, would be as much upon this early period as is required. It is a cause for satisfaction that they have been translated. The English editions are on the table. They deal with the History of Art in Phœnicia, Cyprus, and Asia Minor; Ancient Egypt; Chaldæa and Assyria; Sardinia and Judæa; Persia, Phrygia, and Primitive Greece. Indian architecture, unhappily, has not been illustrated in a manner worthy of the subject. When we look at the grand books published in France on Eastern Art, we can form some idea of the elaborate works which would have been produced had India been a French instead of a British possession. It is true volumes illustrating special surveys have been published; but for an historical view of the subject we must consult Mr. Fergusson’s volume dealing with Indian and Eastern work, and a very interesting volume recently published in France by Monsieur Le Bon, entitled “Monuments de l’Inde,” and I should mention a very useful series of six portfolios of architectural details, drawn by natives under the direction of Colonel Jacob, which was published in 1890. Turning now to Grecian architecture, the first book which it occurs to me to mention is that splendid monument of patient research, Stuart and Revett’s “Antiquities of Athens.” The first volume was published in 1762, and the fourth in 1816, and in 1830 a volume, which can form a supplement to “Stuart and Revett,” was issued, illustrating further antiquities in Greece, the result of a visit there by T. L. Donaldson and Professor Cockerell. Let us pause for a moment to compare the manner of production of, say, the first plate of Stuart’s book with that of the plate of St. Paul’s Cathedral before us. In the first case the drawing has been made, at what expenditure of ability and patience I may well leave you to judge; then the engraving on copper, by an artist of repute, at considerable cost, and taking weeks, perhaps months, to finish; in the other case a photograph has been taken, not, of course, without difficulty; but the actual process occupied but a few seconds of time, and the reproduction, known as “collotype,” is made in a few hours at a fractional cost of the old engraving. But at the time of which we are speaking, it was the fashion to patronise antiquarian and architectural publications, and if you look at the list of subscribers to be found, almost invariably, at the commencement of the books of the period, you will find that a large number of the nobility and members of county families were subscribers for them, although probably few of these subscribers took much heed of them afterwards. Stuart’s “Athens” was quickly followed by the publication of the first volume of the “Ionian Antiquities,” issued by the Dilettanti Society, and it is curious to note that although the Society announce themselves as “some gentlemen who have travelled in Italy,” the only books they published illustrate Greek art. They include the “Antiquities of Ionia,” four volumes, volume four issued so late as 1881; “Unedited Antiquities of Attica”; “Specimens of Ancient Sculpture,” two volumes; Penrose’s “Principles of Athenian Architecture.” All these volumes are beautifully engraved, and a second edition of Mr. Penrose’s work was issued in 1888. It is, however, to be regretted that in their desire to encourage the study of Greek art they did not see their way to issue this work at a price within the reach of many, instead of a very limited few. Other books which I regard as necessary are Cockerell’s “Temples at Ægina and Bassæ,” Wilkin’s “Antiquities of Magna Græca,” and Inwood’s “Erechtheion at Athens.” Considering the importance of Greek Art and the attention now being bestowed upon it, I should advise the acquisition of all these works; but beyond “Stuart and Revett” Penrose is at least an “essential.” Turning now to Roman architecture, I will first mention the works of that marvellous artist Piranesi, who in some twenty-five years published more than thirty folio volumes, containing upwards of 2,500 engravings, illustrating the architectural antiquities of Rome. The force and vigour which he gave to his work has caused him to be known as the “Rembrandt of Architecture.” With migled feelings I would add on the authority of Bryan’s “Dictionary of Painters and Engravers,” that he on two occasions attempted to practise as an architect, but apparently clients were not forthcoming. Some examples of his engravings are on the table. Although I do not propose to overweight our “Library” with any considerable number of his plates, some at least are worthy of a place, both for the subjects they illustrate and the unique quality of the drawing. On ancient Rome the most thoroughly architectural, I was almost saying “practical,” work is Taylor and Cresy’s “Architectural Antiquities of Rome,” a worthy companion to Stuart’s “Antiquities of Athens,” with plates almost equal in beauty (two volumes), published in 1821. Cameron’s “Baths of the Roman” is valuable, as giving illustrations of the Baths of Titus, the ceilings of which inspired Raffaelle in designing the Arabesques of the Loggia at the Vatican. A very valuable work on Roman construction is M. Choisy’s “L’Art de Batir chez les Romains.” The folios by Robert Wood on the “Ruins of Palmyra and Balbec,” and Robert Adam’s folio on the “Palace of the Emperor Diocletian at Spalatro,” all published about the middle of last century, should certainly be added to the library, as they worthily illustrate the remains existing at that time of these examples of Roman splendour, which undoubtedly greatly influenced the Brothers Adam in the design of their many works, most of which are to be found within a mile or so of this hall. On Pompeian architecture and art the most complete work is the very beautiful and elaborate one by “Niccolini,” still in course of publication, although upwards of 80 parts are already issued; this is far too extensive and costly a work to be included in a moderate library; and for architecture, Mazois’ “Les Ruines de Pompeii,” four volumes, folio, published between 1812 and 1838, or Gell and Gaudy’s “Pompeiania,” a copy of which you will find in the room, four volumes, published between 1817 and 1837, or the two folio volumes of drawings, beautifully engraved by W. B. Cooke, with descriptions by Professor Donaldson, published in 1827, may well be substituted. For illustrations of the wonderful painted walls of Pompeii, I place above all Cavaliero d’Amelio’s magnificent series of plates, entitled “Pompei Dipinti Murali Scelti,” recently issued. Of this a copy is on the table. On the authority of the Cavaliero himself I may assure you that the brilliant colours of these plates are absolutely faithful to the originals when first excavated, and before the action of the atmosphere affects them, which it does very rapidly, after their long burial. The following books illustrating the orders and architectural ornaments, both Grecian and Roman, must not be omitted: Normand’s “Parallèle des Ordres de l’Architecture,” an English edition of which, it is interesting to note, was edited by the elder Pugin, and published in 1829. Mauch’s “Architektonischen Ordnungen,” which has been reissued, with a supplement, as late as 1875, Sir William Chambers’ celebrated “Treatise on the Decorative Part of Civil Architecture,” Tatham’s “Etchings of Architectural Ornament,” Vulliamy’s “Examples of Ornamental Sculpture in Architecture,” and Mr. P. Spiers’ “Orders of Architecture,” which is chiefly a selection of plates from “Normand” and “Mauch.” I feel obliged to make a somewhat general grouping of works on Byzantine, Early Christian, Romansque, Saracenic and Mohammedan architecture. Taking the first of these, the authorities are “Texier and Pullan’s Byzantine architecture,” Salzenberg’s elaborate monograph on Saint Sophia at Constantinople, and that very correct and valuable work, “L’Architecture Chretienne,” by Hubsch; this is a careful parallel of the Early Byzantine churches and basilicas. The author is a German, and the book was first published in Germany, but a French edition was also published under the title I have given. Another very valuable work on this period of Art is “L’Art de Bâtir chez les Byzantins,” by M. Choisy, a companion to his work on Roman building, which I have already mentioned in terms of commendation. But above all works on this period of art comes that remarkable monograph, completed only within the last few months, although commenced nearly twenty years ago, on Saint Mark’s at Venice. The publisher, Signor Ongania, in his enthusiasm for the splendid monument, under the shadow of which he spends his days, has issued this most exhaustive work, almost regardless of expense, and, I fear, without commercial benefit. We have here the volume of coloured plates, part of which forms a view of the front upon such a scale as I think no other building has ever been illustrated. These plates and the two portfolios of details, which are also here, will give you some idea of the magnificent manner in which the book has been produced. Surely a publication so worthily illustrating the grandest building of the world should find its way into every public architectural library, although I believe I am correct in saying that it is not to be found in any such library in England. I know it is in some public libraries—notably Liverpool, which can boast of one of the richest collections of architectural books in the country. Then there are Dartein’s work, one of great research, entitled “Etude sur l’Architecture Lombarde,” Mr. T. G. Jackson’s work in three volumes, 8vo., published in 1887, the result of visits to the Dalmatian district, and the fine book by Revoil, three volumes, folio, entitled, “Architecture Romane du Midi de la France.” This has mainly been the source of inspiration for the style introduced into America by the late Henry Hobson Richardson, and since imitated by so many of his followers with a sad lack of his original and vigorous treatment. For Saracenic work I need only mention that of Gally Knight, entitled, “Saracenic and Norman Remains in Sicily,” and a recent work published in America, called “Norman Monuments of Palermo and

Environs." Arabian Art has been splendidly illustrated in Prisse d'Avenne's magnificent work "L'Art Arabe," in three volumes, folio, with a quarto volume of text,—a work which displays in its beautiful plates remarkable examples of the Architecture and subsidiary arts from the twelfth to the eighteenth century. Another beautiful work which is full of detail of Arabian work is that of M. Jules Bourgoin, entitled, "Les Arts Arabes." It is some source of satisfaction that the great monument of "Moorish Art" the "Alhambra Palace" at Grenada, published in two grand volumes in 1842, and which is one of the grandest books illustrating one building ever published in this country, and is mostly the work of an eminent Englishman, the well-known Owen Jones, who with M. Goury went and stayed six months in the Alhambra, during 1834, preparing some of the drawings for this work, and on the death of M. Goury through cholera caught there, returned home, but revisited the Alhambra in 1837, finishing the drawings for the remarkable monograph, a copy of which is here. You will, I am sure, feel that this book has special claims on your attention. Although it will be something of a departure from chronological order, I think it will be a convenient arrangement if I now deal with books illustrating the architecture of our own land and then with those illustrating the different countries of Europe, omitting altogether books dealing with the art of the primitive races of these Islands. I think the place of honour is due to those of John Carter, the pioneer of the Gothic revival. They are entitled "Ancient Sculpture in England," and "Ancient Architecture in England," and were first published in 1780 and 1795 respectively; but the later editions have notes by John Britton, that grand archæologist, who published upwards of fifty volumes devoted to the archæology of his country. I will not weary you with a catalogue of the literature of the Gothic revival, but a few of the books which greatly influenced it must be mentioned in the order in which they appeared, and first must be reckoned the works of John Britton before alluded to. In 1804 he commenced his "Architectural Antiquities of Great Britain," and between 1814 and 1832 he published his celebrated illustrations of fourteen of our English cathedrals—a series of fourteen volumes which still remain the finest of their kind issued in any land. The difficulties he met with in obtaining permission to draw in some of these buildings are recounted with something of bitterness in his autobiography. Britton was ably seconded in his illustrations by the celebrated engraver, Le Keux, whose name is found on so many of the fine engravings of architectural subjects published at this period. With these of Britton's, should be added Wild's illustrations of Lincoln Cathedral which he adopted, and the Durham and Carlisle Cathedrals of that charming draughtsman and archæologist, Robert W. Billings. At the same time that Britton was placing before the public his splendid series of illustrations, that remarkable father of a yet more remarkable son, Pugin, was working upon more strictly architectural lines, and published in 1821 his "Specimens of Gothic Architecture," two volumes, which contains the first exact illustrations of English Gothic. In 1831 he published "Gothic Stone Ornaments," which is beautifully drawn on stone by J. D. Harding, and in the same year commenced his "Examples of Gothic Architecture"; of this the second volume, published about 1835, bears jointly with his own the name of his talented son, Augustus Welby, the architectural genius of the century, of whom Mr. Eastlake wrote, "his name marks an epoch in the history of art which, while art exists at all, can never be forgotten." In 1836 appeared that bitter satire upon the architecture of the day entitled "Contrasts," or a parallel between the noble edifices of the Middle Ages and corresponding buildings of the present, showing the present decay "of taste," the appearance of which made him many enemies, and a few years afterwards he essayed to mollify them by the issue of a small brochure under the title of "An Apology for 'Contrasts,'" which is very scarce indeed. In quick succession followed his "True Principles of Gothic Architecture" and "An Apology for the Revival of Christian Architecture," with, in 1844, his remarkable book, considering the date of its production, the "Glossary of Ecclesiastical Ornament and Costume." I need hardly say that all these works of the Pugins, with others of less importance, which I need not mention, should be included in our library. Proceeding to notice further works upon Ecclesiastical buildings before dealing with those more especially devoted to Domestic, I would mention one which should have found an earlier place. Cottingham's large monograph on Henry VII. Chapel, Westminster, which is of great value for the study of Perpendicular work, notwithstanding the rough production of the drawings by lithography in its early days (1822). Soon after the appearance of the later works by Pugin, came those well-known volumes of the Brandons, "Analysis of Gothic Architecture," two volumes, "Open Timber Roofs of the Middle Ages," in one volume, and "Views and Plans of Parish Churches." Almost simultaneously appeared Mr. Sharpe's magnificent folio, "Architectural Parallels," illustrating the progress of Ecclesiastical architecture in England and Wales through the 12th and 13th centuries, of which Professor Roger Smith says: "Here a certain number of Gothic abbey churches, chiefly those of Yorkshire, are anatomised, compared, and contrasted in the most thorough and interesting manner, and the student cannot do better than turn to it constantly, whilst making his way through Rickman's 'Gothic Architecture.'" A supplement to the "Parallels" was published, giving the mouldings of these Abbey churches, drawn full size. I will here briefly mention the "Seven Periods of English Architecture," the Ornamentation of the Transitional Period, "Mouldings of the Six Periods," which he unhappily left incomplete, and his smaller book, "Window Tracery in England," all excellent books on their subjects. Then close along followed Mr. Colling, who, I am happy to say, is still amongst us, with his beautifully drawn works, "Gothic Ornaments," containing 200 plates of stone carving, with a few examples of Mediæval coloured decoration, and "Details of Gothic Architecture," two volumes, intended to further elucidate such features as were only partially developed in "Brandon's Analysis." These two works of Mr. Colling are, I think, unsurpassed by any illustrating English architecture, both for the amount of work put into them and the correctness and beauty of the drawings, which were mostly made on the spot by the author, from his own measurements. I fear that he has never received the recognition due to him for their production, and I regret to add that he has derived no pecuniary benefit whatever from their publication. In 1857 Messrs. Bowman and Crowther, the Manchester architects, published an important work, "Churches of the Middle Ages," being selected "Specimens of Early and Pointed Structures, with a few of the purest Late Pointed Examples," two folio volumes, giving what may be termed a series of working drawings of examples of church construction in these different periods. To these I must add Wickes' highly artistic, yet correct, drawings, entitled "Spires and Towers of the Churches of England," "Churches of the Nene Valley," the drawings for which were made by Messrs. J. Johnson and W. H. Kersey, under the direction of Mr. Sharpe, by whom the accounts of the churches were written; Mr. James Neale's carefully-drawn monograph of the Abbey Church of St. Alban's before its restoration, and Mr. Gilbert Scott's most valuable "Essay on English Church Architecture" prior to the separation of England from the Roman obedience. Other minor works are: Sir G. Gilbert Scott's "Rise and Development of Mediæval Architecture," Rickman's "Gothic Architecture," Walcott's "Church and Conventional Arrangement," Paley's "Gothic Mouldings" and "Baptismal Fonts," Wollmann's "Examples of Ancient Pulpits," Bury's "Ecclesiastical Woodwork," Bloxam's "Principles of Gothic Architecture," Professor Willis's paper on "The Vaults of the Middle Ages." Turning now to the works illustrating the domestic architecture of our own country, and taking them in chronological order of the periods they illustrate, I must place first, Britton's "Architectural Antiquities of Great Britain," already mentioned; next, Hudson, Turner, and Parker's "Domestic Architecture of the Middle Ages," Mr. F. T. Dollman's "Analysis of Ancient Domestic Architecture," two volumes, containing 160 excellent plates, certainly a unique work, illustrating Domestic buildings down to the 16th century, in a thoroughly practical manner; and Pugin's "Examples," three volumes, already referred to, and which is too well known to need comment. Of half-timbered work some of the best examples are illustrated in Clayton's "Timber Edifices of England," a very scarce folio, and Habershon's "Ancient Half-timbered Houses of England. Nash's "Mansions of England in the Olden Time," needs but a passing mention; it is known to all in its original or smaller edition, and I need only say, get the former if you can. Richardson's "Studies from Old English Mansions," if not so widely known deserves to be so, certainly to the architect, for whom it was more particularly prepared, and to whom it is more useful, as it contains a variety of details of all descriptions. Of a much later production, "Architecture of the Renaissance in England," by Mr. Gotch, I shall not express an opinion; most of you have, doubtless, some knowledge of it. I should add that two lesser works by Richardson, and "Details of Elizabethan Architecture," by Henry Shaw, are worthy of notice, and that, in my opinion, the whole of the volumes of the "Architectural Association Sketch Book" are of the utmost importance in a good architectural library, both on account of the large amount of English work illustrated in them, and for the variety and charm of the draughtsmanship. They contain a large amount of excellent work not illustrated elsewhere, and include valuable details in wood and metal work. For illustrations of the Later Renaissance and Classic Revival in England, the best works are the following:—Inigo Jones's "Designs for Public and Private Buildings," which includes most of his executed works; Clayton's "Large Drawings of the Churches of Sir Christopher Wren," which illustrate them all except his masterpiece, St. Paul's; "Vitruvius Britannicus," started by Colin Campbell, and finished by Woolfe and Gandon, illustrating the public buildings and private mansions designed by Inigo Jones, Sir Christopher Wren, Sir J. Vanbrugh, and other celebrated architects of the time. Gibbs's "Book of Architecture," which includes illustrations of St. Martin's Church, and the "Works in Architecture, Decoration, and Furniture" of those prolific architects the Brothers Adam, of Adelphi fame, a rare work, consisting of beautiful engravings of the most important works carried out by them. The earlier architecture of Scotland is most delightfully illustrated in Billings's "Baronial and Ecclesiastical Antiquities of Scotland, four volumes, which contain 250 engravings. For further illustration MacGibbon and Ross's very voluminous large octavo volumes, on the "Castellated and Domestic Architecture of Scotland," and the Sketch-book of the Edinburgh Architectural Association, should be consulted. Many of the Classic buildings erected in the 18th century will be found in "Vitruvius Scoticus," a bulky volume by William Adam, father of the celebrated brothers just mentioned. I must not be guilty of "one more injustice to Ireland" by omitting to tell you that her ancient architecture has been well illustrated in the comprehensive work, "Notes on Irish Architecture," in two volumes, folio, by the Earl of Dunraven; but I need hardly add the subjects illustrated are rather archæological in their interest. Dealing next with French architecture, and commencing with the Gothic, as I have already dealt with the Romanesque period, we find an Early English authority in John Sell Cotman, whose "Architectural Antiquities of Normandy," two volumes, published in 1822, vividly portrays, in a series of vigorous etchings, the beauties of Norman architecture. These were accompanied by historical notices by Dawson Turner. I may here mention that the elder Pugin published his "Architectural Antiquities of Normany," with beautifully detailed plates, in 1828. A very complete book on this period of architecture, "L'Architecture Normande," by Ruprich-Robert, has been issued. It illustrates in a most thorough manner architectural remains both in Normandy and England. But French Gothic architecture is inseparably associated with the name of M. Viollet-le-Duc, who in 1854 commenced the publication of his famous "Dictionnaire Raisonnée," with its 3,500 illustrations drawn by his own hand. It may be remarked that the publication of this remarkable work came at a time when English architects were turning towards French Gothic, and its influence, together with that of his companion work, the "Dictionnaire du Mobilier," greatly spread that taste for French Mediæval art which held its sway in this country for so many years, only to be followed by the introduction of French Renaissance, for which purpose "Sauvageot," and other works, were already in existence. But

I am anticipating somewhat. Other English books illustrating French Gothic rapidly followed, and led to its general adaptation. Amongst the first of these I must name "Mediæval Architecture of France," by Henry Clutton, published as early as 1853, and Mr. Norman Shaw's "Sketches from the Continent" (1858), illustrating many of the French cathedrals, and the companion work, "Specimens of Mediæval Architecture," by Eden Nesfield, which appeared in 1862. These two works are well known, yet I cannot refrain from quoting Mr. Eastlake's words, that "the skill, the delicacy of touch, the attention to perspective, and the knowledge of detail which they exhibit is worthy of all praise." Then, in 1864, one of the most valuable volumes of masterly geometrical drawings and perspectives, "Specimens of Early French Architecture," by the late Robt. J. Johnson, which was much appreciated, and quickly went out of print. In his preface the author says: "The examples have been selected to display that nobleness, simplicity, and masculine vigour so strikingly characteristic of the period in France, and it is believed that those who are studying Christian architecture will find the results of a laboriously measured series of 'specimens' of the utmost value." In 1865 were published two volumes of photographs of 500 delightful sketches, made by the younger Pugin during his Continental tours between 1836 and 1847. These little sketches, whether representing in a most minute manner some Continental building, or depicting, in a few lines, some detail of stone, wood, or metal, seem to present the object with a force and fulness quite out of proportion with the scale of the drawing. In 1870 William Burges published his "Architectural Drawings," a folio volumes of plates, which represented in a bold manner some striking features of construction and Early French details, mostly of the thirteenth century. This is the last English book devoted to French Gothic, and is in some respects the most remarkable. There is another fine book by M. Jules Gailhabaud, whose name I have already mentioned, in five volumes, entitled "L'Architecture du V. au XVII. siècle, et les Arts qui en Dependent," and much of it is devoted to illustrating the French cathedrals. Two works devoted to French Gothic stonework are Adams' "Receuil de Sculptures Gothiques," and Bandot's "La Sculpture Française;" a beautiful work issued some four years since. I am anxious to draw your attention to a work issued some three years ago by Gelis-Didot et Laffillé, entitled "La Peinture Decorative en France," which gives the most perfect series of reproductions of ecclesiastical mural decorations ever issued, from water-colour drawings specially made. I should like to see a similar work illustrating English examples in so fitting a manner. German Gothic architecture is well illustrated in Förster's "Monuments de l'Architecture," &c., eight volumes, quarto, and I must here speak of two favourite books which give examples of both French and German Gothic; the first is by one of the greatest archæologists we have ever had, T. H. King. The title of the book so well explains its scope that I give it in full: "The Study Book of Mediæval Architecture and Art, being a series of working drawings of the principal monuments of the Middle Ages, whereof the Plans, Sections, and Details are drawn to uniform scales." In the four volumes we have mostly drawings of some hundred different churches, and examples of metal-work, stained glass, &c. The other is "Verdier et Cattois Architecture Civile et Domestique," published in 1857, which contains over one hundred engravings, illustrating many charming examples of Gothic Domestic buildings in Italy and France. For Italian Gothic architecture we must go to Ruskin's "Stones of Venice," and his "Examples of the Architecture of Venice," Street's "Gothic Architecture in North Italy," second edition published in 1874, Dr. Rowand Anderson's "Examples of the Municipal and Street Architecture of France and Italy," Gruner's "Terracotta Architecture of North Italy, which has coloured plates, published in 1867, and "Rohault de Fleury's Toscane au Moyen Age," two volumes, folio, of most delightful drawings in the Mediæval spirit, and was published in Paris in 1873. Spanish Gothic has not been well illustrated in an architectural manner, but we get a comprehensive review of it in Street's "Gothic Architecture in Spain," an octavo, published in 1865. Many exceedingly artistic and picturesque drawings, including illustrations of the cathedrals, are given in "Espana Artistica y Monumental," three volumes, folio, published between 1842 and 1850. Notwithstanding that Spain cannot be regarded as one of the wealthiest of nations, it is refreshing to know that for many years past the Government has contributed towards publishing a suitable record of the Architectural and Art wealth of the country. But for want of support the publication had to be discontinued before the work they had set themselves to do was accomplished. The result of their support is seen in six very large folio volumes, which are on the table, from which you will be able to judge of the grandeur both of the work itself and the monuments it illustrates. We now reach the Renaissance period, and we naturally must in the first place take those books which illustrate the beautiful examples of the land of its birth, and I think I may first name "Palladio's Architecture," the best of the English translations of which is that by Leoni, as it gives a good number of Palladio's pure designs. Then I will remind you of those two remarkable works, the result of years of labour and study, that make us freely translate and paraphrase the celebrated Wren epitaph, and say of the authors, "If you seek a monument of them, look at their works," Letarouilly's "Edifices de Rome Moderne," three volumes, folio, containing 335 engraved plates of measured drawings of the famous palaces and churches. It is said the author devoted thirty years of unceasing labour to this monumental work; still, his energy was far from being exhausted, for he spent the remaining years of his life in preparing drawings for rich monographs in two volumes, on the Vatican and St. Peter's, entitled "Le Vatican et la Basilique de Saint Pierre de Rome." It is much to be regretted that the author did not live to witness the publication of these volumes some 12 years since. You are all, I am sure, aware of the great aid that photography has been to us in representing architecture, and in some recent years the excellent methods of permanent printed productions, showing detail perfectly, have led to many works being published that could not have been otherwise. One of these, entitled "Baudenkmäler Roms," is a volume, I fear, but little known, although it should certainly be found in every library which possesses a copy of Letarouilly's "Rome." It contains 100 photographic plates, consisting of views of façades, &c., and is intended to extra-illustrate Letarouilly's drawings. This combination of photographs and measured drawings should, I think, make a perfect architectural book. There is a magnificent volume of engravings by Volpato, illustrating Raffaelle's Arabesques of the Vatican, a copy of which is here, and will well repay inspection. Herr Schutz's comprehensive series of 330 plates, reproduced from photographs entitled "Die Renaissance in Italien," thoroughly illustrates the Renaissance architecture, sculpture, and ornament of Italy. There remains Nicolai's "Das Ornament der Italienischen Kunst," consisting of 100 phototypes, illustrating the delicate architectural ornament of the 15th century. It is a very fine and useful work. There remains now to be mentioned Cicognara's "Le Fabriche di Venezia," which, in a series of 257 line engravings, illustrates Venetian architecture, chiefly of the Renaissance period; it is regarded as the companion to "Letarouilly," though it is to be regretted that the quality of the drawings are not of equal merit. Signor Ongania has recently given us a charming series of 100 views, reproduced in photogravure, in his "Streets and Canals in Venice," a copy of which is here for your inspection. Other works that cannot be omitted from my list are Gruner's "Fresco Decorations of the Churches and Palaces of Italy," containing 56 minute engravings, which is most valuable for Italian interiors, and has some coloured plates. The same author's "Specimens of Ornamental Art," another large folio issued in 1850, containing 50 plates, mostly in colour, depicting to a large scale various Italian ceilings, decorations, and ornaments. "Architectural art in Italy and Spain" by Waring and Macquoid, large folio, published in 1850, and contains a good collection of Italian Palatial architecture and details. It is interesting to note that they were pioneers in drawing attention to some beauties of the Renaissance architecture of Spain. The next books which call for our attention are those illustrating the Renaissance in France, and a most reliable series of illustrations is to be found in a work no doubt familiar to many of you, Sauvageot's "Palais, Chateaux, et Maisons de France," four volumes, small folio. In its series of nearly 300 engraved plates, the work gives monographs of French Chateaux, illustrating various phases of the later Renaissance. For further details, the library should possess Cesar Daly's "Motifs Historiques d'Architecture et de Sculpture." The first series in two volumes folio, has 200 engraved plates of exterior architectural details and ornaments, and the second series, also in two volumes, contains 250 similar plates, illustrating interior decorations; a few of these plates are printed in colours. But, side by side with these must be placed Victor Petit's splendid series of 100 folio plates, drawn on stone by the author, illustrating the Chateaux of the Loire Valley. Issued in Paris in 1861, it will ever remain one of the best productions of its time. A very interesting work, illustrating the interior decoration and woodwork of the Early Renaissance, is "Rouyer's Decorations Interieures de la Renaissance," published a few years since, and invaluable books to refer to for information and illustrations concerning every branch of French decorative art are Viollet-le-Duc's "Dictionnaire du Mobilier Français," six volumes 8vo, and Havard's "Dictionnaire de l'Ameublement et de Decoration," four volumes 4to. The first of these deals exhaustively with French Gothic art, and the second is rich in its treatment of the later periods. There are various monographs on special Chateaux, notably one on the "Chateau de Blois," illustrated by permanent photographs and coloured plates, and Pfnor's "Palais de Fontainebleau," forming, with its later volume illustrating the rich interior, three volumes folio. The works in Belgian, Dutch, and German Renaissance must now be briefly considered, and here the first place must be given to that surprising testimony of the power of one indefatigable worker to make the art of his country known. I refer to the volumes entitled "Documents Classés de l'Art dans les Pays Bas," published by M. Van Ysendyck, an architect living in Brussels. Here are to be found 700 folio plates, chiefly collotypes, and, as one of his critics truly said, doing for the art of the Low Countries what Viollet le Duc had done for the Mediæval art of France. I suppose that we must say that further credit is due to the author's energy in issuing his work without the aid of a publisher. Yet, even with this extraordinary series of illustrations, we cannot dispense with Prout's "Sketches in Flanders and Germany," fifty beautiful drawings most delicately reproduced by lithography, and Louis Haghe's three folios of sketches in Belgium and Germany, also reproduced by lithography, which works picturesquely and vividly bring before us the quaint architectural beauties, both exterior and interior, to be found in these countries. Then there is a capital collection of 300 phototypes known to many of you, I think, entitled Fritsch's "Denkmäler Deutscher Baukunst." These well illustrate the architecture in the old towns of Germany. The last book to mention is "La Renaissance en Belgique et en Hollande." It comprises nearly 500 lithographed drawings, chiefly of architectural details, and is most suggestive, and well supplements Fritsch's volumes, which depict but views and façades. The buildings of the Spanish Renaissance are illustrated in the Government publication I have previously spoken of, in Sir M. Digby Wyatt's volume of clever impressionist sketches entitled "An Architect's Notebook in Spain," and in Mr. A. N. Prentice's recent volume, "Renaissance Architecture and Ornament in Spain," for which, I am pleased to say, the author has received his meed of praise. As I have already mentioned the principal authorities on the interior decoration of the various historic periods, there remain but few others for me to particularise on this and some special arts as applied to architecture. For examples of historic ornament, our library must possess Owen Jones's "Grammar of Ornament," the original folio edition of which was published in 1856, and a smaller edition, the plates being reduced, in 1865. To this may well be added the two series of Racinet's "L'Ornament Polychrome," which gives some 3,500 fresh examples. I would certainly include Cesar Daly's "Decorations Interieures Peintes," two vols. folio. The examples shown in this book are all printed in colours, and are copies of decorations which were carried out in Paris about fifteen years since; no work has ever appeared which sets before us, so truthfully and artistically, complete schemes of colour decorations. The books on furniture and woodwork which I would put on our library shelves in addition to those previously mentioned are Marshall's "Specimens of Antique Carved Furniture and Woodwork"; Small's "Scottish Woodwork of the 16th and 17th Centuries"; Shaw's "Specimens of Ancient Furniture," and, for the late styles, Heaton's "Furniture and Decoration in England during the 18th century,"—a work which gives 200 selected plates of reproductions from the scarce works by Sheraton, Hepplewhite, Chippendale, the Brothers Adam, Pergolesi, and others. Copies of the original books can be added later if the library is so disposed. The volumes which I should place in the library on constructive metal-work are Mr. Starkie Gardner's little handbook—and I hope to see a more important work from him on this art to which he is so devoted—Heftner Alteneck's two volumes on the metal-work of the Middle Ages and Renaissance, entitled "Eisenwerke Ornamentische der Schmiedekunst des Mittelalters und der Renaissance," and D. J. Ebbett's "Decorative Wrought Ironwork of the 17th and 18th Centuries." For examples of monuments from the Celtic times to the 18th century, we need only have Brindley and Weatherley's "Ancient Sepulchral Monuments," which has 600 specimens selected from all authorities, and to help us in the designing of stained glass we need place in the library Winston's "Hints on Glass Painting," two volumes, octavo, published in 1867, Diver's "Works of Early Masters," two volumes, folio, containing many coloured plates of Belgian, Dutch, and English examples, and above all Mr. Westlake's most painstaking and scholarly work on the "History of Design in Stained Glass," the fourth and concluding volume of which has just appeared. Now I think you will agree with me that, with few exceptions, we do not want to study Continental architecture except for suggestions of construction and planning. The books which I consider worth a place in our library are Daly's "L'Architecture privée au XIX. siècle," first and second series, in six volumes folio, containing 450 engraved plates, exhibiting the principal mansions, hotels, shops, restaurants, &c., erected in Paris and the suburbs during the reign of Napoleon III., and under the control of Baron Haussmann, a latter book in four volumes, folio, by M. Narjoux, entitled "Paris elevé par la Ville," the seventy-eight monographs in which describe town halls, markets, schools, hospitals, workhouses, abattoirs, morgues, &c.; then the elaborate monograph illustrating M. Garnier's magnificent building, the new "Opera House at Paris," in two volumes, large folio and quarto text, and the equally extravagantly produced works on the Opera House and the Palace of Justice at Vienna. But when we come to consider modern architecture in England we have to confess that there is no book illustrating it—something to be deplored when we know the admirable work which has been designed by our leading architects, and the value of it for study by all. Mr. Mountford, in the course of his recent interesting address to the Architectural Association, said: "The one and only way to learn how to design is by the constant study of existing work. I say existing work advisedly, because it is my belief that the study of modern work is as necessary, and more useful, perhaps, than that of old work. Of course, we must study old work—that goes without saying; but by all means study modern buildings as well." For illustrations of this modern work we have to turn to the architectural journals. You know them well; but let me just mention them, and the year of their first publication:—The *Builder* was commenced in 1843, the *Building News* in 1854, the *Architect* in 1869, and the *British Architect* in 1874; and with sets of these journals should be included a set of the *Transactions* of the Royal Institute of British Architects, the later volumes of which are splendidly produced. In these five sets we shall not only find modern work illustrated, but to quote Professor Roger Smith's words, "papers on, and illustrations of, almost every subject that you can think of. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded." To make the library complete must be added, when they can be met with, sets of the sketch-books issued by private societies, all illustrating examples of ancient architecture, and many interesting details of wood and metal work. The chief of these are the "Architectural Association Sketch-Book," of which, since 1867, 24 volumes have been issued, containing over 1,700 plates; the "Spring-gardens Sketch-Book," commenced in 1866 at the suggestion of Sir G. Gilbert Scott and Mr. J. T. Micklethwaite, and finished in 1891, the result being eight large folio volumes, containing nearly 600 plates, naturally mostly illustrating Gothic work. Not more than 72 copies of any volume were published. Then there is the "Abbey-square Sketch-Book," initiated by Mr. John Douglas, at Chester, and of which three volumes have appeared; and, lastly, the "Edinburgh Architectural Association Sketch-Book," of which five volumes have been issued. As I understand that Mr. Middleton is going to read a short paper on "Students' Manuals," I will not read out the list I have prepared, and to which I have added a few books on public buildings and institutions, and a few special branches of practice.

Historical Works, most of which have not been Previously Mentioned.—Gwilt's "Encyclopædia of Architecture"; Fergusson's "History of Ancient and Mediæval Architecture"; Fergusson's "History of the Modern Styles"; Fergusson's "History of Indian and Eastern Architecture"; Roger Smith's "Classic Architecture"; Roger Smith's "Gothic and Renaissance Architecture"; Rosengarten's "Architectural Styles." The handbooks on Gothic Architecture I have already detailed.

Architectural Drawing and Perspective.—Spier's "Architectural Drawing"; Cassagne's "Practical Perspective," translated by G. Murray Wilson; Professor Ware's "Modern Perspective," 2 vols.

Practical Construction.—"Notes on Building Construction," 4 vols.; Mitchell's "Elementary Building Construction"; Mitchell's "Advanced Building Construction"; Wray's "Instruction on Construction"; Viollet-le-Duc's "Lectures on Architecture," 2 vols.; Newland's "Carpenter's and Joiner's Assistant"; Tredgold's "Elementary Principles of Carpentry," by Hurst; Baker's "Masonry Construction"; Stock's "Shoring and Underpinning"; Middleton's "Stresses and Thrusts"; Timmin's "Iron Roofs."

House Planning.—Kerr's "English Gentleman's House"; Stevenson's "House Architecture," 2 vols.

Professional Practice. — Professor Banister Fletcher's textbooks on "The London Building Act, 1894," "Dilapidations," "Arbitrations," "Valuations and Compensations," and "Light and Air"; Hurst's "Architectural Surveyors' Handbook"; Kerr's "Consulting Architect"; E. Marsland's "Rules and Regulations Affecting Building Operations in the Administrative County of London"; *Transactions* of the Institution of Surveyors from commencement in 1868 to date, and also the "Professional Notes" of this Institution, commenced in 1886, and still being published.

Sanitation, Warming, and Ventilation. — De Chaumont's "Habitation in Relation to Health"; Hellyer's "The Plumber and Sanitary Houses"; Middleton's "House Drainage"; Galton's "Healthy Dwellings"; Billing's "Warming and Ventilation"; Hood's "Warming Buildings," by F. Dye.

Specifications, Quantities, Estimating, &c.—Leaning's "Specifications"; Rogers' "Specifications for Practical Architecture"; Professor Banister Fletcher's "Quantities"; Leaning's "Quantity Surveying"; Stephenson's "Estimating"; Stephenson's "Repairs: How to Measure and Value Them."

BOOKS ON PUBLIC BUILDINGS AND INSTITUTIONS AND A FEW SPECIAL BRANCHES OF PRACTICE.

Public Baths, &c.—Allsop's "Public Baths and Wash-houses."

Farm Buildings.—Clarke's "Farm Buildings"; Denton's "Farm Homesteads of England"; Stephens's "The Book of Farm Buildings."

Hospitals, Asylums, &c.—Burdett's "Hospitals and Asylums of the World," 5 vols.; Burdett's "Cottage Hospitals"; Galton's "A Few Points on Hospital Construction"; Mouatt and Snell's "Hospital Construction and Management."

Landscape Gardening.—Blomfield's "The Formal Garden in England"; Kemp's "How to Lay Out a Garden"; Repton's "Landscape Gardening," by Loudon.

Schools. — Robins's "Technical School and College Buildings"; Robson's "School Architecture."

Theatres.—Contant, "Parallèle des Principaux Théâtres Modernes de l'Europe"; Daly et Davioud, "Théâtres de la Place du Chatelet"; Garnier, "Nouvel Opera de Paris"; Gosset, "Traité de la Construction des Théâtres"; Magne, "Le Théâtre du Vaudeville, Paris"; Vander Null et Von Siccardsburg: "The New Opera House at Vienna."

There are many points which I have not been able to touch upon, and the subject has not been treated as it deserves, partly on account of want of time on my part in preparing my notes, due to the very limited leisure I have been able to allow myself, and, further, owing to the short period given me in which to present my paper to you. But I trust I have shown you that upon the history of architecture a noble series of volumes exists, and although many of the authors mentioned are foreign, I think we, as Englishmen, may justly pride ourselves, not only for the part our countrymen have played in forming the history of art, but especially so for the valuable works they have produced illustrating the architecture of the past, especially of their own land.

Mr. E. J. Kibblewhite proposed that a very hearty vote of thanks be given to Mr. Batsford for his most comprehensive and interesting paper. He might suggest that in such a library of an architectural society as had been sketched, one would like to find not simply books on purely architectural subjects, but works written by architects on other subjects, novels, and poems. There were many such—besides Mr. Hall Caine's magnificent creations, and it always seemed to him that in all such one could distinctly trace the influence and benefit of the architectural training and instincts of the authors. Such volumes as Viollet-le-Duc's "Habitations of Man," Professor Kerr's strange novel, entitled "An Ambassador Extraordinary," and Mr. J. T. Bottle's great poem "Brian Boru," ought not to be missing from such shelves. It should be regarded as a duty by such societies as theirs to undertake the publication of monographs on architectural subjects, which, although of the highest value to students and the profession, were not likely to be directly remunerative to the author. He might mention that the Building News had many years before in some measure thus co-operated with Mr. James K. Colling in the publication of his great work on "Art Foliage," which, he thought, was fully worthy to rank with his other works mentioned by Mr. Batsford, and it was to be regretted that his labours had never recompensed their most able author. None of them would fail to recognise the great services which Messrs. Batsford had rendered to the architectural profession during the last fifty years, and as one who had been in the habit of walking into Batsford's for some 33 years, he could testify to the discriminating knowledge which members of the firm possessed of all architectural literature, which had been abundantly manifested in the excellent paper to which they had listened that evening with so much interest and pleasure, and for which they would accord the lecturer their hearty thanks. They were also indebted to Mr. Batsford for displaying such a rich and varied assortment of choice illustrated folios on the tables surrounding the room.

Mr. G. A. T. Middleton, in seconding the vote of thanks, remarked that Mr. Batsford had given them a wide survey of the principal books on architecture published in England, France, and Germany. It was evident that such works were not now supported by patrons in this country to the same extent as a century ago, and it was to be regretted that such undertakings were almost always unremunerative—indeed, it was a relief to him that Mr. A. N. Prentice's experience was an exception to this general rule. The publication of books of this class needed to be subsidised, and one way in which it could be accomplished would be by getting each of the great public libraries to take a subscription copy.

Mr. Woodward supported the vote of thanks, and expressed the wish that some wealthy man would provide the Society with just such a library as Mr. Batsford had described. One of the most interesting books exhibited was Pugin's "Contrasts," which would well repay study at the present day. He should like to see a similar "Parallel between the Edifices of the XIVth and XVth centuries" at Oxford, and those erected during the last few years by so-called distinguished architects. Certainly the draughtsmanship of the profession was not improving, and some wretched designs were submitted in a recent competition for a branch free library in Hampstead by two well-known men. Indeed, he took his son with him to see these drawings at the Hampstead Vestry Hall; but withdrew as quickly as possible, lest they should corrupt the boy's architectural morals. Mr. Batsford had omitted from his list several works which he thought would have been included—such as Pugin and Butler's "Public Buildings of London," and John Pennethorne's "Geometry and Optics of Ancient Architecture." They were greatly indebted to Mr. Batsford for contributing so valuable a paper, which would become a textbook on the subject.

Mr. J. Henry Quinn, chief librarian at the Chelsea Public Library, mentioned that at that institution a point had been made of providing as many architectural works as possible.

The President mentioned that Mr. G. A. T. Middleton had prepared a short paper on "Students' Manuals"; but on account of the lateness of the hour, he wished it to be taken as read; it would duly appear in the Society's *Transactions*. He then put the vote of thanks, which was cordially passed.

On the motion of Mr. Edgar Farman, seconded by Mr. Sidney Marsland, a vote of thanks was awarded Mr. Middleton.

Mr. Batsford briefly acknowledged the motion, and remarked that he had not mentioned Pennethorne's work, as, in his experience, it was neither inquired for, nor referred to, at the present day.

THE AWARDS AT THE ROYAL ACADEMY SCHOOLS.

Sir Fredc. Leighton, P.R.A., delivered a short speech to the assembled students and their friends on Monday evening last at Burlington House, when the annual prizes were presented to the successful candidates. The general character of the work exhibited, he said, an extremely high and commendable standard of excellence, though the studies from the life hardly reached the level of merit which previous years had witnessed. Part of the President's address was devoted to the class of design directed more particularly to the decoration of public buildings, and he dwelt upon the high importance of such work, because of its immense potentialities for public utility in this, or indeed, we presume, any other country. He said that several extremely careful and pretty designs had been sent in for the subject set for the prize in this class—viz., "The Vintage." Indeed, some of the compositions were almost more rightly described as pictures, and these works had suggested to him one or two points to which he wished to draw their attention. The first was the absolute necessity of aiming at a broad and dignified and monumental simplicity, such as should characterise that class of work and distinguish it from other branches, such as easel painting. He also wished to point out the importance of bestowing as much care as they possibly could on the supplementary, the accompanying, study, of a fragment of their design, because those designs were sent in in order that they might test the capacity of the student to carry out the work on a larger scale than in the design.

The first prize of £40 was awarded in this class to Miss Hilda Koe. We can but remark upon the lack of the charm of colour, and the absence of the true decorative spirit which the chosen design illustrates, though perhaps on the whole it may be considered the best of the series of designs in this competition. They all display a singularly-marked deficiency of proper tuition, and not one of the contributions has realised the essential limitations peculiar to the suitable treatment of a flat surface considered as the adjunct to an architectural effect adequately subordinated to the conventional restrictions dictated by the strictly decorative idea. The prize scheme is sketchily shown in a rather grimy blending of purple and green, which would absorb the light too much for most positions in actuality, and the composition, considered as a whole, is too disconnected and full of lines. No. 129, on the other hand, though well massed and broadly managed, is somewhat too crowded with figures. They are well drawn, however, and group cleverly, somewhat after the style of Sir John Gilbert in the matter of colour. The leopard's skin, for example, on the central girl is particularly well suggested. The lumpy drapery and strange angularity of the composition figured 127 spoils it as an attempt at design, and the long ungainly arms of the figures are singularly unfortunate, while the crudity of the yellow employed must be admitted. Still, the author of this scheme has adhered to a general breadth of handling and a sense of the value of unity of scale, both in colour and in form, which ought not to be passed over without commendation. All the cartoons contributed are very poor, and we can hardly see wherein the President finds so much for congratulation. In the Architectural Room, so to speak, undoubtedly the best thing is Mr. Percy Edward Newton's design for a public library to cost £20,000. He has been awarded the Royal Academy Travelling Studentship, value £60. Only two competed for the prize, and there could be no question whatever as to the choice, for the second plan is very indifferent, and its treatment architecturally may be described as an ill-considered rendering of the Georgian style, devoid of any sense for proportion, and wanting in a knowledge of detail. Mr. Newton's prize design, on the other hand, has a freshness about it, and exhibits a study of good work, both old as well as new. The breadth and value of wall space is well realised, with two segmental oriel bays marking the first floor in an unobtrusive manner. The central entrance archway is hardly so successful, and the scroll-like ends of its hood-mould form an unsatisfactory base for the two niches containing statues on either side of the opening. The figure frieze over is crude in draughtsmanship, and, generally speaking, the drawings themselves are not very good. The plan is excellent, and the rooms are well lighted. The reference library, situate on the first floor, has a flat domical ceiling and lantern light, with massive columns bearing Ionic caps supporting the ceiling in a monumental fashion. Galleries divide the height of the apartment and increase the book space. In the rooms below, the bookcases recall some to be seen at Cambridge. The commissioners' room is panelled, and has a good fireplace, with a well-designed overmantel enriched with inlay. The figure corbels below the main cornice of the facade are crude and clumsy.

Six sets of measured drawings were sent in for the Royal Academy Silver Medal, the subject being the Banqueting Hall at Kensington Gardens, now known as the Orangery, a long room, with two antechambers, one at either end, and a terrace in front. The 1st medal is taken by Mr. George Weald, and the 2nd medal is given to Mr. Pieter Rodeck. The chosen set of drawings are careful, but spiritless, delineations, with the brick jointings lined-in in a hard, cold way, rendering the bnilding more bald than it actually is. The selection for the second prize deservedly demands a protest, for the drawings are shockingly poor, inky in drawing, and laboured in style with the ornament and caps incorrectly shown. No. 191 is a far better set of drawings, though the sheets are somewhat dirty, and the more ornate parts of the enrichments are avoided. The essential portions and mouldings are all set forth in detail, with dimensions and jointings accurately noted in a way which shows a thoroughness entirely wanting in the prize sheets. The Architectural School work is rather better than usual on the whole, though Mr. H. S. Morris wins £25 for a poor design for an entrance hall. The reason for the choice is not obvious, seeing that No. 195's design for a school of arms seems to be a much more creditable performance.

The following is the official list of the awards:—Landscape painting—a moorland—Creswick prize (£30), Percy William Gibbs. Painting of a figure from the life (open to male students only)—silver medal, 1st, Percy William Gibbs; silver medal, 2nd, Owen Baxter Morgan. Painting of a head from the life—silver medal, 1st, Edith Lydia Clink; silver medal, 2nd, Isabel C. Pyke-Nott. Painting of a draped figure (open to female students only)—silver medal, 1st, Emily Florence Watters; silver medal, 2nd, Katherine Mary Willis. Cartoon of a draped figure—a draped figure of the goddess Ceres—silver medal and prize (£25), Rose Livesay. Design in monochrome for a figure picture—Shadrach, Meshach, and Abednego in the fiery furnace (Daniel iii. 21)—Armitage prizes, 1st (£30) and bronze medal, Victor John Robertson; 2nd (£10), George Radolph Aylmer. Design for the decoration of a portion of a public building—a vintage—prize (£40), Hilda Koe. Set of six drawings of a figure from the life (open to male students only)—1st prize (£50) and silver medal, not awarded; 2nd (£25), Shirley Charles L. Slocombe, disqualified owing to having received the same prize before; 3rd (£15), Charles Augustus Büchel, disqualified owing to having received the same prize before; 4th (£10), Owen Baxter Morgan. Drawing of a head from the life—silver medal, 1st, Morris Bernstein; silver medal, 2nd, Gerard R. T. Leigh Hunt, disqualified owing to having received the same prize before. Drawing of a statue or group—silver medal, 1st, not awarded; silver medal, 2nd, Allan D. Davidson. Perspective drawing in outline (open to painters and sculptors only)—the small cloisters of Westminster Abbey—silver medal, no competition. Model of a design—the Fates—1st prize (£30), Francis Derwent Wood; 2nd (£10), Frederick Thomas. Set of three models of a figure from the life (open to male students only)—1st prize (£50) and silver medal, Henry Poole; 2nd (£20), William Willis. Model of a bust from the life (open to female student only)—silver medal, 1st, not awarded; silver medal, 2nd, Emily Florence Watters. Model of a design containing figure and ornament—grape gathering, the vine to be treated decoratively—silver medal, not awarded. Model of a statue or group—silver medal, 1st, Hibbert Charles Binney; silver medal, 2nd, Margaret C. T. G. Thurlow. Design in architecture—a public library in town—travelling studentship (£60), Percy Edward Newton. Set of architectural drawings—the banqueting hall, now called the Orangery, Kensington-gardens—silver medal, 1st, George Weald; silver medal, 2nd, Pieter Rodeck. Set of architectural designs (upper school)—prize (£25), Henry Seton Morris. Set of drawings of an architectural design (lower school)—prize (£10), Cecil Claude Brewer. Plan of a building—a Government school of art for a large manufacturing town—prize (£10), Ernest Tatham Richmond. Original composition in ornament—silver medal, no competition. Perspective drawing in outline (open to architects only). Hanover Chapel exterior—silver medal, George J. J. Lacy. The Landseer scholarships in painting and sculpture of £40 a year each, tenable for two years, have been awarded—in painting, to Shirley C. L. Slocombe and Percy William Gibbs; in sculpture, to Henry Poole and Robert Edward C. F. Glassby.

THE INCIDENCE OF TAXATION ON REAL PROPERTY AND LAND.

At the ordinary general meeting of the Surveyors' Institution, held on Monday evening last, a discussion took place on two papers dealing, from somewhat different points of view, with the above subject. The first, entitled "The Incidence of Taxation on Land," was read by Mr. A. D. Clarke at the meeting of November 26th; the other, by Mr. W. Sturge, was read at the meeting under notice, and the discussion on both ensued.

In his paper, Mr. Clarke traced the history of the incidence of taxation on real and personal property down from the days of "danegelt," "carucage," and "scutage," to the recent Finance Act, and showed that while the earlier taxes were levied on real property and "movables" alike, the latter had, owing to difficulty of collection and frequency of evasion, succeeded in slipping gradually out of taxation; so that when it was said that the present imposition of new taxes on real property was only the bringing of it into line with personalty, the case was wilfully or ignorantly misstated, for real property already bore burdens from which personalty had been relieved. The many steps by which the present state of things had been reached were detailed by Mr. Clarke at length, but in too minute detail to be summed up in the short space at our command. It is enough to say that Mr. Clarke's history seemed to fully bear out his theory that land bore much more than the share of the burden which it was originally intended should be placed upon it. He contended that land-tax was no more an hereditary burden on land, as had been argued, than were the ordinary obligations of occupation hereditary. He showed by calculations that if two persons inherit each, say, £6,000, the one buying and stocking a farm of 200 acres with his share, and the other investing his in the Funds, the former, entering on a risky and by no means always prosperous occupation, will pay some £30 in taxes on an income of probably about £275, or 11 per cent.; while the latter, on a certain income of £165 per annum, would only pay 44s., or about 1¼ per cent. on his income. Thus, the man who invests in land the capital now so much needed to keep it in cultivation is taxed eight times as heavily as the stockholder or tradesman, while all enjoy the same

State protection and the same local services, provided out of a common fund to which they contribute in such unequal proportions. The popular idea was to attract persons to the land, and the State, by means of special legislation, was endeavouring to assist this object; but no one need be surprised, in the face of the fiscal anomalies which the author had pointed out, at the reluctance of the investor to place his capital in land, or of the working man to take advantage of legislation by acquiring the ownership of such heavily-burdened property. There was also much reason to believe that the unequal pressure of the burden had tended much towards the decay and disappearance of the old race of yeoman owners. Under present industrial conditions, Mr. Clarke contended, the land of the country, placed in competition with that of the whole world, might fairly be considered as raw material, which in every other case the State had long since ceased to tax direct, or at least as the plant or machinery used in the production of manufactured articles; but even where such machinery was held to be taxable, the proportion of burden it bore in comparison with the value of the output was infinitesimally smaller than that which was placed upon the land.

Mr. Sturge, in his paper on "The Burdens on Real Property and Land," after dealing, as Mr. Clarke had done, with the general history of the land-tax and similar imposts, proceeded to deal with the tithe-rent charge. He was old enough, he said, to remember the practical working of the old tithe system before the passing of the Commutation Act, and he believed that at present, under the much less cumbrous system, the average burden imposed by the tithe-rent charge was something like 3s. 6d. in the pound on the rental value of mixed agricultural land. The earliest record we had of any provision for the maintenance of the poor was that, in very early times, one-fourth of the tithe was devoted to the relief of the poor; but in process of time this practice came to an end, and the whole tithe was appropriated to ecclesiastical uses. Various Acts for the relief of the poor were passed, culminating in the well-known Act 43 of Elizabeth, which was the foundation of all rating to the present day. The effect of subsequent Acts was such that the poor-rates rose from £600,000 at the beginning of the 18th century to 3 millions at its close, and to over 6¼ millions in 1834, or 8s. 9d. per head of the population. What the rates in the pound were during those years it was not easy to ascertain, as, so far as he knew, there was no record of the total assessment of property until 1843. Mr. Sturge proceeded to criticise, adversely, the dictum of the present Chancellor of the Exchequer that, at a man's death, his whole property passes to the State, and can only pass to his heirs and assigns by a grant from the State, which had an anterior title to what it might consider its share. He showed that this argument was utterly fallacious, and asked, if it were true, how and by what deed or document was the title conferred on the heirs. Proceeding to deal with the "Finance Act, 1894," Mr. Sturge showed that it placed new and very heavy burdens on the land, which was ill-prepared at the present time to bear them. The new estate duty, ranging as it did from 1 per cent. on property up to £500 in estimated value to 8 per cent. where the value was one million or over, would impose, taking the average expectation of life of a person succeding to be 25 years, a tax equal to an income-tax for life varying from 1s. in the pound on an estate producing £400 a year to 2s. 9d. in the pound on an estate producing £80,000 a year. The tables were calculated on the average life of a lineal successor; but in the case of a collateral relation, for instance, the charges would fall still more heavily on the annual income of the heir. The effect, Mr. Sturge said, in conclusion, of these new imposts cannot fail to be felt throughout the whole community. British agriculture has to compete in almost every direction with the whole world, with no advantage over that of other countries except the cost of freight, and every fresh burden laid upon the land cannot but tend further to cripple our greatest wealth-producing industry.

In the course of the discussion upon the two papers, which followed, there seemed to be a consensus of opinion that land, already unfairly taxed in proportion to personal property, was by the new Finance Act still further unjustly and unwisely burdened.

Mr. E. P. Squarey commented on the fact that while some years ago it was customary to value an annuity arising from land at some 27 to 33 years' purchase, it was now worth no more than from 20 to 25 years' purchase, while Consols were worth some 37 years' annuity, and this in face of the fact that the value of land could hardly fall lower, while in 11 years Consols must depreciate.

Mr. F. K. Munton was struck by the fact that two members of the Institution had considered the question of so important a nature as to simultaneously deal with it in a paper.

Sir Richard Paget thought it very significant that a body of men such as that then assembled, dealing with and interested in land, should be unanimous in condemning its unfair taxation.

Mr. J. F. L. Rolleston, as representing landed interests in the Midlands, regarded the Finance Act as the last straw which would strain the landowner's already overburdened back to breaking point; and similar views were expressed by Mr. J. M. Brown, Mr. E. J. Castle, Q.C., Mr. Howard Martin, and Mr. W. Mathews.

A vote of thanks having been unanimously accorded to the authors, the discussion was adjourned.

COMPETITIONS

Bristol.—For the erection of a public library for St. Philip's district, on a site north of Holy Trinity Vicarage, the city council received sixteen sets of plans and designs from architects practising in Bristol. At Wednesday's meeting of the city council, the library committee reported that they had selected those submitted by Mr. W. V. Gough, who estimated the cost of carrying them out at £4,350, the limit of expenditure named to competitors being £4,500. The committee's recommendation was approved, and Mr. Gough's plans were adopted.

Coventry.—The city council, at their last meeting, adopted the instructions to competitors proposed by the assessor, Mr. Charles Barry, F.S.A., for the designs to be invited for municipal buildings. All architects practising in Coventry, and certain others outside its boundaries, are to be asked to compete. An attempt was made to bind the council to a limit of cost for the buildings, but this was rejected by 23 votes to 5.

Stockport.—The competition for the new workhouse has resulted in an unexpected development, the proposal to invite architects to compete having been abandoned, and the suggested assessor elected as architect for the intended new building. The reports in the three local journals are not very clear on the point—doubtless the reporters did not know the purport of the technical expressions relating to architects' remuneration, and possibly the speakers were not too explicit; but the selected architect is said to have offered to carry out the work at a commission of 4¼ per cent. It seems that at Monday's meeting of the Stockport Board of Guardians, the Rev. P. H. Moore moved that the resolution of the guardians deciding to offer premiums of £50 to each of the unsuccessful competitors in the plans competition for the new workhouse scheme be rescinded; and also that the resolution of the board deciding that a professional assessor be sought to assist in the erection of the new workhouse be rescinded. Mr. Rowcroft protested that such a course would be grossly unfair, as 33 architects had applied for particulars in response to the board's advertisement; but the motion was carried by 14 votes to 8. The Rev. P. H. Moore then proposed a second resolution, which he said also came from the sub-committee. It was that the board appoint Mr. W. H. Ward, of Birmingham, to act on behalf of the guardians as sole architect in the erection of the new workhouse. There were 33 candidates for the post of architect, and a letter was read from Mr. W. H. Ward, offering to act as assessor. Correspondence had taken place between Mr. Ward and the board, and it was clear that if they engaged Mr. Ward instead of going upon the other system, considerable saving would be effected. For one thing, there would be the saving of the premiums of £50 to each unsuccessful competitor, £250 in all. Then there would be the assessor's fee, another £150. Then there was to have been the ¾ per cent. commission on the actual cost. If they went to a figure as high as £90,000, this item would amount to £675. Then there was a commission of 1½ per cent. for preparation of quantities, which would mean about £1,350, making a total outlay of £2,275, which would be saved if the proposal of the sub-committee were accepted by the board. Mr. Ward was not merely a critic of other men's work, but a man who knew how to carry out the required works himself. In Mr. Ward they had a man of eminence who had done grand work himself, and he did not think they could do better for the ratepayers than by appointing Mr. Ward. The clerk then read a lengthy correspondence which had taken place with Mr. Ward, also a number of testimonials which had been sent from the Bradford, Sheffield, and Birmingham boards of guardians, and from the mayor of Birmingham, and other people. All the letters were couched in remarkably eulogistic terms, and stating that if engaged on however large contracts, the final cost rarely exceeded the original estimate put forward by Mr. Ward, and that the plans he prepared always met with the approval of the Local Government Board. Mr. Rowcroft repeated his previous remarks about the appointment being an unjust one if it was made. Mr. Lees said the motion brought forward from the sub-committee was a most unfair one, and held that the policy which dictated it was a most unsound one. He was certain that it would not be received favourably by the ratepayers. In spending a large sum of money, probably amounting to £100,000, they must obtain the best possible information from the professional circle to which Mr. Ward belonged. How were they to utilise their judgement in the matter if they simply stood aside and allowed one individual to do what he liked in the preparing of plans and estimates? He might be one of the best architects in the kingdom for that special purpose, but surely there were others who were as well qualified. Mr. Williamson said the question was, Would they get the best plans from a competition? They had tried it once, and even the best ones selected were disapproved by the Local Government Board. The commission which Mr. Ward asked for was a low one, and his appointment would be the most expeditious and cheapest plan. The motion was carried, after further discussion, by 18 votes to 4.

Sutton, Surrey.—Thirty-seven sets of designs have been received in the competition now pending for the new public offices and technical institute about to be erected on a corner site in the High-street, facing the Baptist Chapel, and next Throwley-road. Part of the scheme will include a public swimming-bath. The intended outlay is limited to £8,000. The drawings were received at the end of last month, and they will be on view after the award has been made. £50 is the amount of the first premium, and £20 is the value of the second prize, both designs to become the absolute property of the Board.

CHIPS.

A memorial is to be erected in Winchester Cathedral in honour of Sir Gerald Portal, of Uganda fame. Mr. Storey, of Rome, has been commissioned to execute the work.

General Hutchinson made on Friday, on behalf of the Board of Trade, a final inspection of the Forfar and Brechin Railway, which has been constructed for the Caledonian Company, under the direction of Mr. Thomas Barr as principal engineer.

It is definitely announced that the western portion of the Lancashire, Derbyshire, and East Coast Railway has been abandoned because the subscriptions did not justify the directors in proceeding with this expensive scheme. The western end was that part of the line running across Derbyshire, Cheshire, Lancashire, and connecting Macclesfield, Warrington, Knutsford, and Liverpool.

A new turret clock showing time on four illuminated dials has been made and erected in the tower of the Southport Infirmary by Messrs. Wm. Potts and Sons, of Leeds and Newcastle-on-Tyne, the donor being Councillor W. Austerfield, J.P.

At Manchester, on Tuesday, the statue of the late Oliver Heywood was unveiled in Albert-square by the Lord Mayor. The commission has been carried out by Mr. A. Bruce Joy, who was also the sculptor of the John Bright statue in the same square, and, as in that case, the figure is of white Sicilian marble and the pedestal of granite. The foundations and arrangements for the fixing of the statue have been carried out by Messrs. J. and H. Patteson, of Manchester, under the direction of the city surveyor. The cost has been £2,700.

The jubilee of the restoration of St. Mary's parish church, Stafford, under the direction of the late Sir Gilbert Scott, will be celebrated on Sunday and Tuesday next. It has been decided in commemoration of the event to provide in the chancel six bays of canopied choir screens, as originally proposed by Sir Gilbert, and these are being carried out by Mr. Bridgeman, of Lichfield.

"SIMON THE CYRENIAN FORCED TO CARRY THE CROSS."—NEW MARKET HALL AND PUBLIC OFFICES, GOOLE.—ADDITIONS TO "IVANHOE," REIGATE.—ST. MARGARET'S CHURCH, CLEY-NEXT-THE-SEA, NORFOLK.—ILLUSTRATIONS OF FOREIGN THEATRES.

Our Illustrations.

SIMON THE CYRENIAN IS FORCED TO CARRY THE CROSS AFTER JESUS.

The above is from the *Via Crucis*, by N. H. J. Westlake, F.S.A., at the Dominican Priory, Haverstock Hill. It is the subject of the fifth station of the Way of the Cross as now used, and it is treated in a manner which illustrates the meditation on this particular station. The Gospels state that Simon was *forced* to carry the Cross (St. Matthew xxvii. 32): "And going out they found a man of Cyrene named Simon, and him they *forced* to take up His Cross." The meditation in the prayers said at this station has the passage, which shows its object: "I will not refuse the Cross as the Cyrenian did—I accept it, I embrace it." Simon, therefore, illustrates the conduct of those who do not of their own free will and goodness of disposition suffer for justice's sake, or to aid their fellow-creatures, or for the love of the Great Sufferer, but those who have the grace even to be forced. Perhaps much the larger number of all classes who carry a cross are of the Cyrenian type. The composition has been elongated and somewhat altered in treatment in the picture itself at the Priory, our illustration being only from the first study. It is painted on panel in a rich soft tone of colour on a gold background, and the pictures have been all conserved under glass to protect them from the staining influence of London smoke and the dangerous element of the condensed breath of a large congregation, one of the most subtle and dangerous destroyers of delicate work. There are fourteen subjects in the whole *Via Crucis*, in the painting of which Mr. Westlake has some reputation. He did the first series ever done in England many years ago at St. Francis', Notting Hill, and he has recently painted those at Maynooth College Chapel, which each measure 12ft. by 8ft. We gave an illustration of one of these on Sept. 25th, 1891, and on Jan. 20th, 1888, an illustration of the chapel itself was given in our pages.

NEW MARKET HALL AND PUBLIC OFFICES, GOOLE. (SELECTED DESIGN.)

In this recent competition there were about forty competitors, and this design was chosen, and obtained the premium of £100. We illustrate its ground plan and two main elevations. The two façades are occupied by shops, with three archway entrances to the market-hall situate to the rear. The offices entrance is placed in the centre of the front facing Boothferry-street, of which we give the elevation. The public offices on the first floor comprise a board-room, 40ft. by 20ft., clerks' offices and waiting-rooms, surveyors', inspectors', and gas and water offices; suitable lavatories are provided. The staircases are of stone, and the passages are fireproof; lifts communicate the various stories. The second floor is devoted to four suites of offices, with private and general rooms, and one set with three offices. The caretaker's rooms form part of this floor. All the buildings are heated with hot water. The architect is Mr. W. J. Tennant, of Pontefract.

"IVANHOE," REIGATE.

This illustration shows an addition to "Ivanhoe," Reigate, for Mr. James Powell. The ground floor is one large ball-room, with a recessed fireplace at one end; above it are a series of bedrooms. The walls are built of concrete, faced with the local Reigate stone, the dressings being of Monk's Park stone. Messrs. Holloway Bros., of Queen's-road, Battersea, carried out the work, from the designs of Messrs. Read and Macdonald, architects.

CHURCH OF ST. MARGARET, CLEY-NEXT-THE-SEA, NORFOLK.

This church, of which we furnish a set of geometrical drawings as well as a perspective view, is one of several magnificent churches in the Cromer and Lynn district of Norfolk, which, although well deserving inspection, are hardly so well known as might be expected. This church at present consists of chancel, clerestoried nave, north and south aisles, north and south transepts (of the former of which only fragments of walling remain, while the latter may be described as a ruin), north, south, and western porches (the latter also a ruin), and a small square tower at the western end of the north aisle. The church was evidently founded in the 13th century, as appears by the tower and chancel, both of which are Early English in style; but considerable alterations were made in the Decorated period, when the nave and aisles were pulled down and rebuilt, and, in all probability, the transepts added. At an even later date the aisles were remodelled into the Perpendicular style when the porches were built, so that the building in reality exhibits the three principal styles of English Gothic architecture. Its present condition, however, affords but traces of what must have been its pristine beauty, the tower requiring considerable renovation, while the nave—a most beautiful example of the Decorated style—has, both externally and internally, been sadly neglected. The shapes and arrangements of the windows of the clerestory are specially interesting, and very unusual. Over the piers to the arches on the south side of the nave are allegorical figures richly carved in stone, and still bearing traces of colour, while on the north side canopied brackets (also at one time coloured) contained statues, long since demolished. The font is a good example of 15th-century, and the pulpit of Jacobean, work. The latter is dated 1611. The present roof is a hideous arrangement of deal painted yellow, erected some thirty years since, which is shown on the section to be removed and replaced by one in oak, as near an approach to the original as can well be imagined, taking into consideration the fact that nothing remains as a guide. This roof is similar to those of neighbouring churches. The roofs to both north and south aisles are Mediæval, presenting remains of good 15th-century carpentry (fortunately affording traces of what the nave roof must have been while existing). The windows to both aisles are Perpendicular, undoubtedly replacing the Decorated. The chancel seems rather small in proportion to the size of the nave, and is entered by a rather low arch, which has been cut away to allow room for the apex of the cross over the rood. Part of the rood stair and the hooks and staples for the screen remain, but there is, unhappily, not a vestige of the latter. Six old miserere stalls still exist. The north and south transepts are shown in their restored state, as also their roofs; the nave and chancel roof to be releaded, and a new wooden spire to the tower, covered with shingles, as suggested. We are indebted to the diocesan surveyor, Mr. Herbert J. Green, of Norwich, for the drawings of this church. We gave a sketch of the porch in the Building News for September 6, 1889.

FOREIGN THEATRES.

For description and further sketches see paper on "The Modern Theatre of the Continent," by Mr. Edwin O. Sachs, on page 839.

* * *

A new board school is approaching completion at Stafford. Mr. Nicholas Joyce, of that town, is the architect, Mr. Jervis the builder, and Mr. Pebworth the clerk of works.

The catacombs of Syracuse, in Sicily, form a great subterranean town, with numberless tombs cut out of solid rock. Dead of all ages, from those of the Greek invasion to those of last year, are there interred.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Carlisle Architectural, Engineering, and Surveying Association.—A meeting of the above association was held in the Town-hall, Carlisle, on Monday, Dec. 10, when a paper was read by Mr. Edwin B. Newton, city surveyor's office, Carlisle, on "Gauging the Flow of Water." The lecturer commenced by giving a brief summary of the history of the science of hydraulics, mentioning the earliest experimentalists and the results they arrived at. He then gave comparisons of the various formulæ in use at the present day, referring especially to those by Darcy and Rutter, pointing out the shortcomings of all, and expressing the view that to obtain a correct formula capable of universal application what was needed was accurate and careful observations of actual flow, and notes made of the various atmospheric and natural conditions prevailing at the time the experiments were made. He then described the various forms of current meters, and detailed the operations necessary in gauging the flow of a river by means of floats, &c. The lecturer then explained the methods of gauging water by means of weirs of various shapes, and gave as his opinion that rectangular weirs were best for moderate flows. The several formulæ for calculating the discharge over weirs were explained. The lecture was illustrated by diagrams and various instruments kindly lent by the city surveyor of Carlisle, Mr. W. Howard-Smith.

Sheffield Society of Architects and Surveyors.—The monthly meeting was held on Tuesday evening, the 11th inst. A lecture on "Wentworth House: Historical, Descriptive, and Illustrative, with Practical Observations on some Materials used in the Building," was given by Mr. William Dickie. The lecturer referred to the early ancestry of the Fitzwilliam family, and carefully traced the history of Wentworth Woodhouse from the middle of the 16th century to the present time.

CHIPS.

The parish church of St. Luke, Farnworth, Lancs., is undergoing restoration at a cost of £4,000, and will also be provided with a new organ as a special gift. The architects are Messrs. Paley, Austin, and Paley, of Lancaster.

The governors of Christ's Hospital have come to a final decision to adopt the Horsham site for the new school. We illustrated the selected design for the buildings, that by Messrs. Aston Webb and Ingress Bell, in our issues of June 22 and 29 and July 6 and 13 last.

Major-General Phipps Carey, an inspector of the Local Government Board, held an inquiry at Shipley, Yorks, on Friday, as to an application by the Shipley Local Board for powers to borrow £55,000 for sewage-disposal works and refuse destructors. Mr. John S. Rhodes, clerk to the board, explained that the board proposed to collect the sewage of Windhill and Shipley into two trunk sewers—one by Bradford Beck and the other by the river Aire—and convey it to a site at Dockfield for treatment. The two engineers, Mr. Woodhead and Mr. Paterson, explained the scheme.

A piece of ground in St. George's-road, Truro, formerly known as Culver's Close, which Alderman Heard has purchased and laid out as public gardens, was formally handed over to the citizens on Friday. The land has been laid out under the direction of Mr. John Mitchinson, and is divided into flower-beds, terraces, and grass plots, intercepted by curved paths.

The annual general meeting of the Cardiff Master Builders' Association was held at the Angel Hotel on Wednesday week, the vice-president, Mr. F. S. Lock, being in the chair. The election of officers for the ensuing year took place, with the following result:—President, Mr. Alderman D. Jones; vice-president, Mr. F. S. Lock; hon. treasurer, Mr. W. Geen; hon. auditors, Messrs. L. Purnell and J. E. Turner; hon. secretary, Mr. W. M. Shepherd.

The pair of fountains and one pair of the vases on columns, which were presented some time ago for the Hanley Park, are now erected on the terrace in the Cauldon grounds. They are all in bronzed iron, manufactured by the Coalbrookdale Company, except the stone bases. The fountains are each about 8ft. high, including the stone bases and plinths, the latter being 10ft. in diameter. One is surmounted by a water-carrier figure, and the other by a kneeling boy. The fountains are placed upon carved stone bases and plinths, executed by Messrs. R. and W. Burt, of Stoke. The two laurel vases, on columns already erected, are nearly 6ft. in height. There are two more pairs of vases and columns, of other two designs, being prepared at Coalbrookdale.

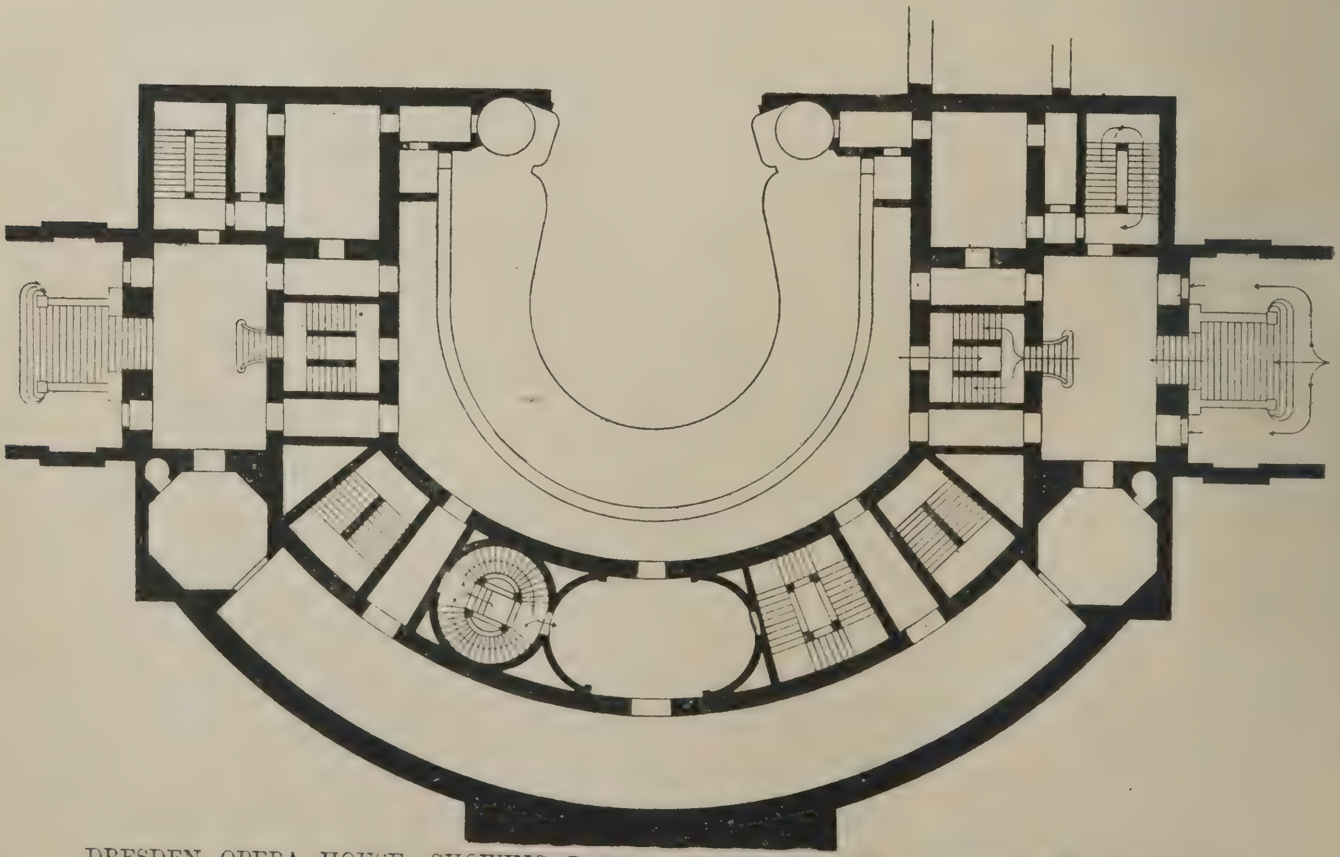
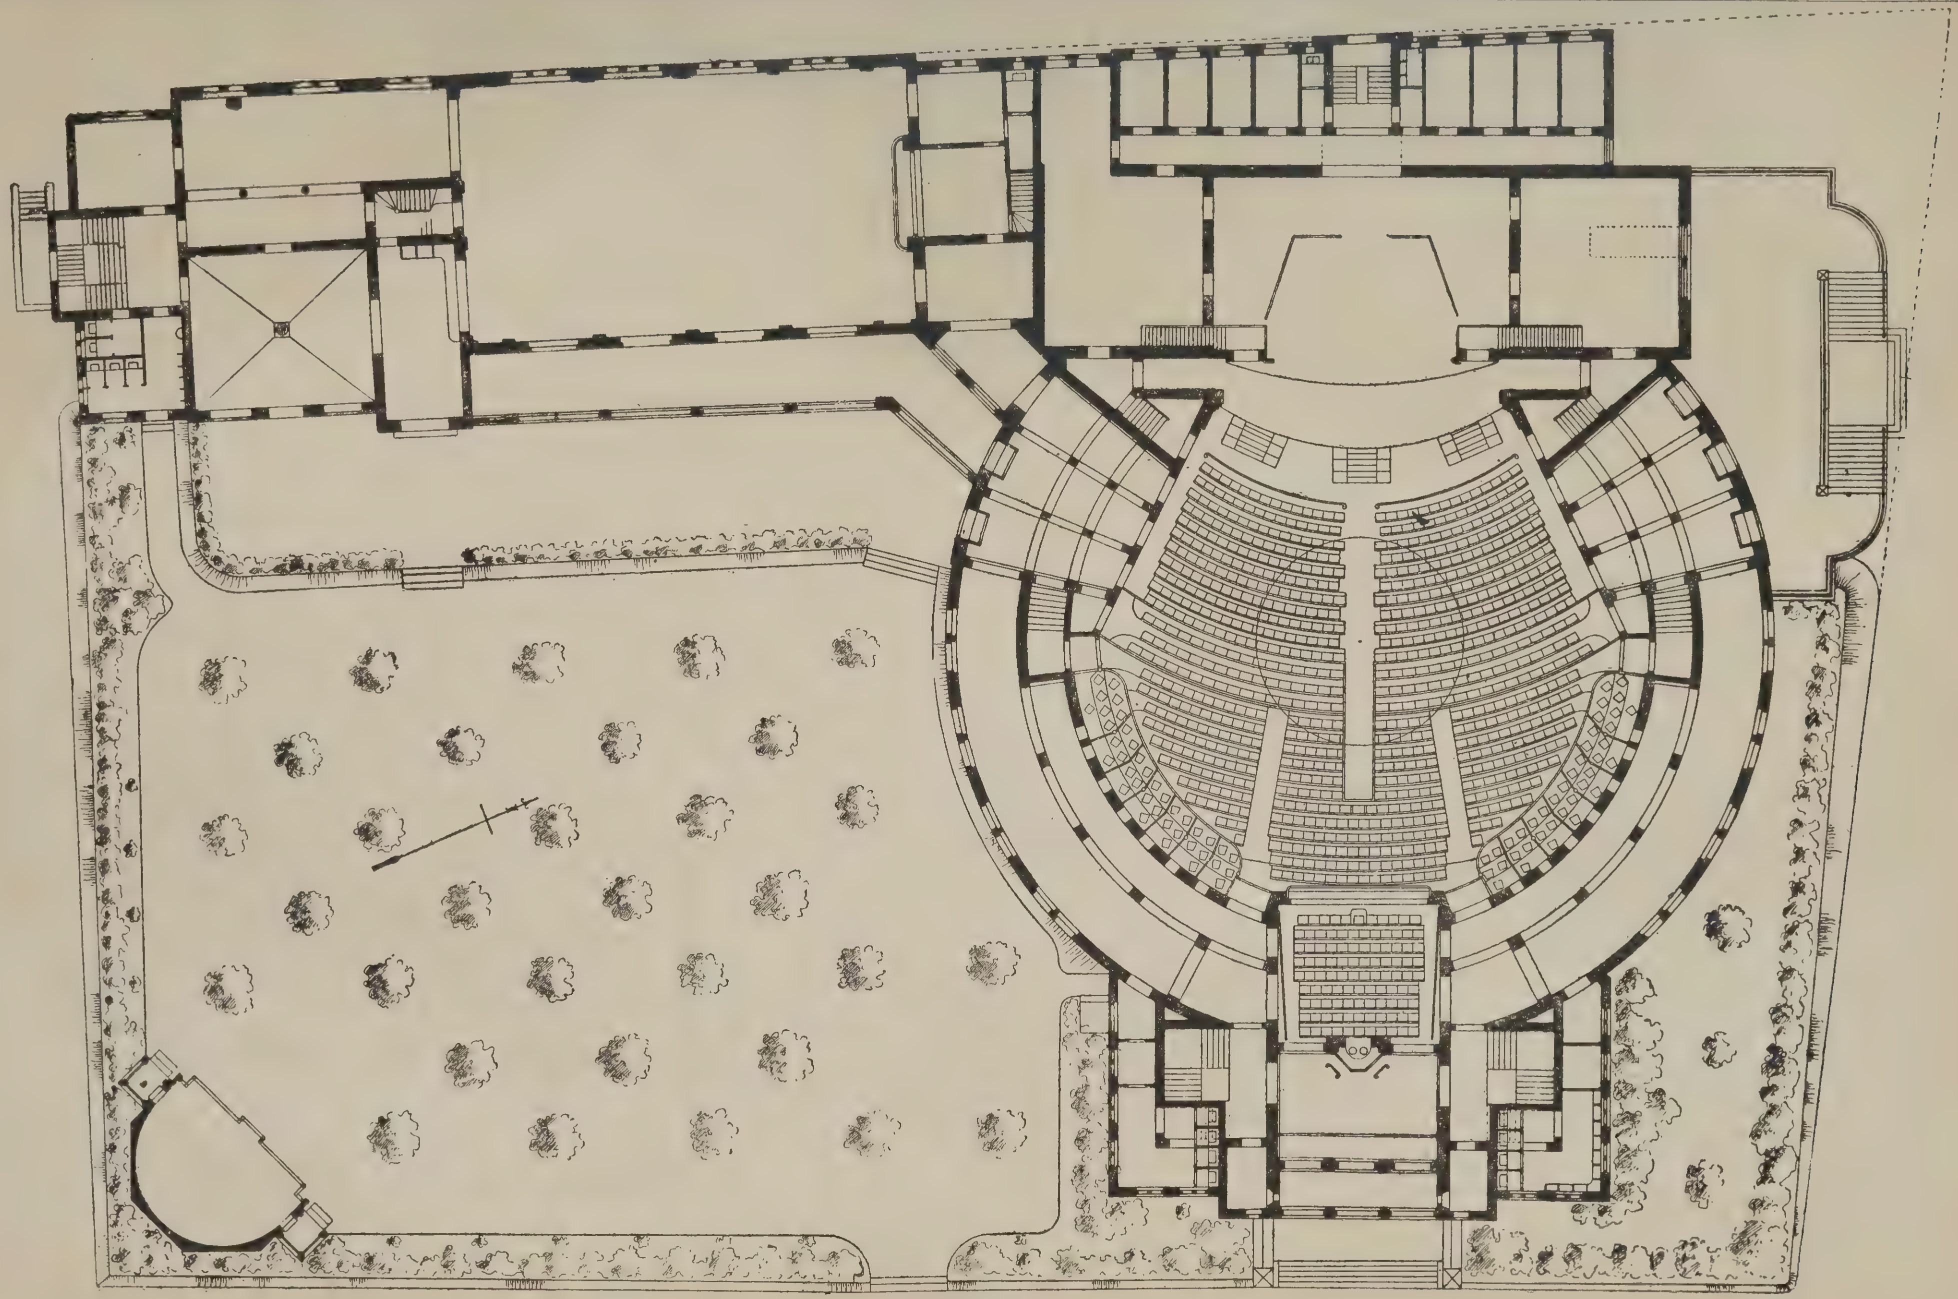
WORMS PEOPLE'S THEATRE.—*Architect:* Otto March, of Berlin.



DRESDEN OPERA HOUSE, SHOWING RADIAL STAIRCASE AND CURVED FOYER SCHEME.



[GROUND PLAN.]

WORMS PEOPLE'S THEATRE.—*Architect:* OTTO MARCH, OF BERLIN.

WAYSIDE NOTES.

Who'll swallow the Leek? It *is* a mouthful this time! Send in the guineas, and get ready for the magnificent opportunity offered to architects by the Leek Improvement Commissioners next March. Three premiums of £50, £25, and £10 offered for the three best designs for new covered markets, *all three premiated designs to become the property of the Commissioners*, who reserve the right to appoint their own architect. That is to say, in all probability, for the small sum of £175, the Commissioners hope to get the best ideas of the profession, and to "convey" them with the aid of their own man-of-all-work. In the absence of any guarantee to the contrary, and in default of the appointment of a professional referee, I am going to spend my guinea in Christmas crackers, and I wish something a trifle more startling may explode a little consideration into the minds of these very wide-awake gentlemen at Leek before the festive season closes.

I hear that the new wing of the General Post Office is expected to be ready for occupation by the end of next March. The building is now in the hands of the Office of Works, who are busy preparing the place with furniture and fittings for the staff of the secretary's office and that of the accountant and receiver-general's department, who are to migrate there from their present premises in Newgate-street. The Telegraph department will absorb the whole of the vacated quarters, and even this enlargement will give barely sufficient accommodation for the operators, so great has been the development in recent years of this branch of the Post-Office service.

From a report on sewer ventilation just issued by the city surveyor of Hereford, it is evident that the best and cheapest mode of sewer ventilation is by connection with tall chimneys where that is possible. In the instance where this was effected at Hereford the first cost was only £12 12s., the annual after cost nil, and the average extracting capacity 4,468c.ft. per hour; while with ventilators, extractors, and destructors the first cost varied from £20 3s. 8d. to £38 1s. 9d., and with one system there was an annual after cost of £29 16s. The average extracting capacity of ventilators and extractors varied from 267c.ft. to 2,291c.ft. per hour. Unfortunately, high chimneys are not always available; but in view of the objections to most extractors and ventilators, and the high annual after-cost of same, it is doubtful whether, after all, it would not be cheaper for sanitary authorities to build them, than to rely on gas-lamp destructors and ventilators.

The German Kaiser has the ill-luck to rub raw many people—among them Herr Wallott, the well-known architect of the new House of Parliament at Berlin. As will be remembered, the Emperor crossed the name of Herr Wallot off the list of those who were proposed at the last Exhibition for the gold medal, which Madame Vilma Parlaghy, the painter, received. This and some other occurrences of the kind were the subject of a group of humorous plastic representations at a banquet given to Herr Wallott by the Berlin Union of Architects. There was a model of the new House of Parliament. The foundation was built of black bread, the pillars of sausages, the cellars of Swiss cheese, and the ornaments of confectionery. The dome consisted of a real cheese dish-cover. The Germania on the top was a smart lady's maid, whose horse was led by a lackey. The whole was called "The Acme of Taste." The Emperor, as will be remembered, called the new Parliament House the acme of bad taste. A sort of automatic machine was also shown, with the inscription: "On throwing the great gold medal into the slot, the song 'An Ihr' ('To her') is played." The "her" evidently means Madame Parlaghy. The model of a lustre (called in Germany "crown-lighter") hung from the ceiling, and was in the form of an old crinoline. A "prize fresco for the Parliament Hall of the Reichstag" treated of the latest occurrences. President von Levetzow is shown receiving a kick from Herr Singer, and Herr von Manteuffel wringing his hands over it. Militarism was represented by a musketeer, who is flogging the representatives of other classes of the population. At the entrance to the banquet-hall there hung from a cord a great gold medal which a lady painter tries to grasp. In the speeches the feeling prevailing was expressed more seriously. Herr Wallot especially spoke impressively of his regret that he was forced to hasten the building. The chairman of the Union of Berlin Architects presented Herr Paul Wallot with a laurel wreath with the words: "The New House of Parliament, on which in invisible letters the golden inscription stands, 'To the German People,' is a triumph of German art."

The panic at the Belfast schoolroom shows the usual carelessness and neglect exhibited in conducting such entertainments within premises unfit, and not built for, the reception of a public audience. The continuance of the practice of giving entertainments in schoolrooms and halls which are not licensed or certified by the authorities as fit for the purpose is surprising, and, to say the least, not legal. In almost every district these illegal performances are given nightly, especially at this time of year, and the greatest offenders in this matter are a class of people to whom one would naturally look to uphold the law. We refer to the clergy and officers of churches and chapels, who organise these entertainments in connection with the various sections of their work. It is quite true that there are some schoolrooms in and around London where the parson holds a license for music, &c.; but the number is indeed small compared with the many without. The fatal panic at Belfast is commented upon in a leader in the *Standard*, which states that the real lesson to be learned is that a crowd of children should never be left to take care of themselves. In our humble opinion the real lesson to be learned is that entertainments of this kind should never be illegally given in unlicensed premises where the ordinary measures of safety are not insisted upon by the authorities. The simple provision of a few oil-lamps would have saved the lives of the little ones lost at Belfast, and had the premises been under the authorities no doubt they would have insisted—as all English and Continental authorities do—that all places of public entertainment should be provided with two distinct means of lighting the exit-doors, passages, and staircases. Again, the position of the gas-meters must have been a faulty one, or there could have been no possibility of tampering with them.

Mr. Edwin O. Sachs, in the two lectures delivered by him last week—one at the Society of Arts, and the other at the Association—emphasised the necessity of teaching people, when children, to leave a building on the follow-my-leader lines as a training in after-life against losing their heads in cases of panic and alarm. This teaching of Mr. Sach's should receive the attention of the School Board.

Mr. Batsford's paper on "Architectural Books," read at the Society of Architects on Tuesday, was a most valuable contribution to architectural bibliography. I heartily recommend every student to buy an extra copy of to-day's Building News, or to get the number of the Society of Architects' *Transactions* containing it, and to keep it carefully as a reference-list. Few young architects can afford to buy all the books—even at Batsford's, where bargains tempt some of us oft-times; but all young architects should borrow them, and read them somehow. It is something to be proud of, moreover, that no art can boast a more able and unselfish set of literary contributors than English architects, most of whom have worked, at great personal loss, for the benefit of their fellow students, whose debt of gratitude is a very real one.

The gifted architect of that magnificent Renaissance Church, the Brompton Oratory, has passed away at a prematurely early age before the completion of his great work; but it is some consolation to know that it will be finished entirely on the lines of his design. Few architects of this generation will have left their mark more indelibly on the ecclesiastical art of the century than Herbert Gribble, who died last Saturday. In many respects differing from the other great Catholic architect of the age, Augustus Welby Pugin, there was this in common with the two: their utterly unselfish devotion to their art, and the complete absence of the least taint of the commercialism that has marred some careers. More years ago than I care to remember I predicted to Herbert Gribble himself the career that was before him, and long afterwards—partly in reference to my prognostications, and partly to the first success of his student days—the winning of our "Sketch Book" Prize for his remarkably able drawing of Westminster Abbey, he used in familiar conversation playfully to style himself "The Child of the Building News." There were few men that I have known more thoroughly deserving of the success he gained, and few who will be more regretted. "R.I.P."

London's County Hall is still to be built, the County Council having resolved, at its last weekly meeting, that in the mean time the present offices at Spring-gardens must suffice, with whatever additional accommodation is necessary and can be acquired in the neighbourhood. This decision was based upon a report by the Establishment Committee, in which it was stated that full inquiry had proved the unsuitability of any portion of the Liberator buildings on the Victoria Embankment. Lord Monkswell, at whose suggestion the inquiry was undertaken, complained of bias on the part of the committee; and Mr. Fardell, in moving for a further and fuller report, to be prepared in conjunction with the Official Receiver, declared that if it had not been for Lord Rosebery's powerful opposition a year ago, when a similar scheme was discussed, the Council would either have erected a new hall at Westminster, or have removed to more suitable offices. Having adopted neither of these alternatives, Colonel Hughes suggested that probably the Council was delaying until the House of Lords was available for use as a sufficiently stately and dignified County Hall; but if not, he thought they should await the result of the Unification Report, when they might probably capture the Mansion House. Mr. Fardell's amendment was lost, and the Council finally agreed that it was undesirable to take any steps for the acquisition of the Liberator buildings.

CHIPS.

Mr. Joseph Mears, builder and contractor, of Kensington, died very suddenly on Friday at his residence in Earl's Court-road. He was in his 53rd year.

The city council of Chester on Wednesday sanctioned a plan for the widening and improvement of St. Werburgh-street. The buildings on one side of the street have been purchased by the corporation, and these are to be pulled down for the purpose of widening the street. The effect will be that a much better view of the cathedral will be obtainable from the main street, and the approach to the cathedral will be greatly improved.

The Conway and Colwyn Bay water committee have received a report from Mr. Fenwick, the arbitrator in the dispute between Mr. Jones and the board, announcing his award as to the value of easements upon property in the Conway Valley, the amount being over £700.

The corporation of Bristol have acquired, for the citizens, the Museum and its valuable collections, the sum of over £2,870 having been given by the residuary legatees of the late Sir Charles Wathen to enable the transfer to be made. The building has remained in an unfinished state since it was opened twenty years ago; but it is now being decorated from the original drawings prepared by the architect, the late Mr. Foster, under the direction of Mr. W. V. Gough, of Bristol.

Mr. J. Passmore Edwards has promised the Shoreditch Library Commissioners a contribution of £1,000 towards the erection of their second library in Pitfield-street, as soon as they are ready to have the foundation-stone laid. This offer will bring up Mr. Edwards's donations to the Shoreditch libraries to £5,250 and 1,000 books.

The peal of bells in the church at Gillingham, Dorset, has been restored and rehung by Messrs. Blackbourne and Greenleaf, Salisbury, at a cost of £150; it is now proposed to augment the peal by adding first and second bells, at an expenditure of £125.

At a meeting on Friday of the baths committee of the Bath city council, Mr. J. M. Brydon, architect of the Pump Room extension, showed the perspective view of the Roman bath with the water left uncovered and the colonnade over the *scholæ*, as decided by the committee a fortnight previously. Mr. Lewis moved the recommendation of the plans for adoption by the council, saying he had contended for Major Davis's plans as long as he could, believing them to be best, but he acknowledged himself beaten, and there was a point at which opposition became faction. The motion was carried by 11 to 1, six members not voting. The Local Government Board having already given their sanction to the scheme, the last obstacle towards carrying out the extension in accordance with Mr. Brydon's plans, selected in the recent noteworthy competition, is now overcome.

THE MODERN THEATRE OF THE CONTINENT.

By Edwin O. Sachs.

At the fortnightly meeting of the Architectural Association, on Friday night, Mr. Edwin O. Sachs read a paper entitled "The Modern Theatre of the Continent," illustrated by a large collection of valuable drawings, which had been brought together with much trouble and great expense. Among the drawings we noticed some from Russia and Sweden, besides a large number from countries less remote. Among the former, Prof. Schroeter's set, showing the proposed Imperial Opera House at St. Petersburg, were greatly admired, and some curiosities from Tiflis in the Caucasus, Nischni-Novgorod in the Urals, and Irkutsch in Siberia excited general interest.[*] Having referred to the lecture by Mr. Ernest A. E. Woodrow on "The Requirements of a London Theatre," read before the Association in March, 1892 (fully reported in the Building News for March 25, 1892), the author said he proposed to treat chiefly on buildings where the financial aspect as a rule played only a minor part for all concerned. Thus, at Halle, the competition conditions required a building for £21,000; the architect's estimate on receiving the commission figured at £25,000, and the actual cost was £39,000. Herr Seeling, of Berlin, was the happy architect. He proposed to restrict attention to the countries in which the theatre matters were treated on German lines—those of Northern and Central Europe—and to the theatres erected within the last twenty years. It was common to hear the greater size and the elaboration of the Continental theatre ascribed to the advantage of "State aid"; but it was by no means the important factor it was represented to be over here. The number of National or Government theatres was comparatively very small. The majority of the theatres were the outcome of municipal efforts, the results of voluntary subscriptions and guarantee funds, or of the liberality of royalty. Continental theatres could be classified as follows:—I., Court theatres; II., National and Government theatres; III., municipal or district theatres; IV., subscription theatres, with or without Court, Government, or municipal subsidy; V., private theatres, with or without Court, Government, or municipal subsidy. The private theatre alone was intended to be a money-making concern, which would amuse or educate its patrons according to the local requirements. The others were built without any mercenary motive, either (1) for the satisfaction of luxury, (2) for educational purposes, or (3) for recreative purposes; or for a realisation of any two of these intentions, and even all three in exceptional cases. The Court theatres were essentially the luxury of royalty, originated and kept up at their expense. The public visited these playhouses on sufferance to enjoy the exhibition at a smaller outlay than would be their lot if the institution were run on commercial lines. All officials were admitted on the free list. The Government institutions, which were paid for out of the taxes, were practically only open to a limited number of the wealthy and cultured, as the few occasions on which the doors were thrown open to all comers were rare indeed. The municipal theatre was generally intended for educational and recreative purposes, and outside the actual outlay for the building, the ratepayers, as a rule, only had to make up the small difference between the actual expenditure for the maintenance and management and the amount received for admission. The favourite mode of management was to put the building and fittings at the disposal of a good manager, and to allow him a small subsidy conditionally that a fixed approved scale of admission and booking charges was not exceeded, rules being laid down as to the state in which the building was to be kept. The municipal theatre was the public assembly-hall of the town, in the fullest sense of the word. The subscription theatre was run on similar lines to the municipal institution, with the great difference that its existence was primarily due to a desire on the part of the cultured and moneyed to obtain the luxury of a good play; but their contributions might also be partly considered as a gift to the locality. The municipality often gave substantial help, partly perhaps in the form of a good site, and partly in a subsidy towards keeping the building in repair. The latest outcome of the subscription theatre was one built and run on democratic lines for the education and recreation of the working classes. The private theatre abroad was managed on precisely the same principles as our own. The lecturer dealt at some length with the different classes of entertainments given in the theatres of the Continent, showing that the constant change of bill which characterised the performances necessitated plenty of storage accommodation and a more roomy stage than we were accustomed to, while actors, managers, engineers, and the lighting department all wanted more space. He asked the indulgence of the audience, as he proposed to venture on some laudatory comments on the architecture shown in the modern Continental theatre, and that in a room where sweeping condemnation and pessimism for everything done by modern architects seemed to be considered attractive. In particular he must protest against Mr. Beresford Pite's recent attack on the Paris Opera House as an "abortion." Mr. Sachs pointed out that English theatres, as a rule, simply required architects who were clever planners, good constructionists, and business men. It was a minor consideration if the architect possessed art feeling, if he had an art ghost, or simply relied on some fibrous plaster manufacture for his so-called art. If anything, it was more important that he should have the talents and facilities of a financial agent or company promoter. Continental theatre architects attached the greatest importance to the art side of the profession. They were allowed to have ghosts; but these phantoms only belonged to the species that revelled in specifications, sanitation, warming and ventilation, stresses and strains. He had to be conversant with the *art* of planning, but was not necessarily an expert in the details of stage machinery or electric lighting. The modern Continental theatre demanded a maximum amount of real beauty, including the most careful blending of architecture, sculpture, and painting, and this where all the practical requirements were generally against the realisation of perfection, and where the requirements were more complicated, numerous, and essentially technical than in any other class of work. The architects of Continental theatres had ranked among the foremost men in the profession. Thus the late Gottfried Semper in Germany, Baron Hasenauer in Austria, Von Ibyl in Hungary, Basile in Italy, and among those still living, Garnier of Paris, Anderberg of Stockholm, Schroeter of St. Petersburg, Messrs. Fellner and Helmer and Seeling of Berlin, might be named. Possibly the audience could not hear in some parts of the beautiful Hofburg Theatre at Vienna, or they might complain of the heavy interior decoration of the Opera House at Buda Pesth; but taken as a whole, there were few buildings, old or new, that could be said to surpass the great Continental theatre of to-day. In their architectural variation and adaptation they showed an immense amount of originality and true art. He would ask whether Messrs. Semper and Hasenauer's "Hofburg" theatre was not very near perfection, and full of originality?

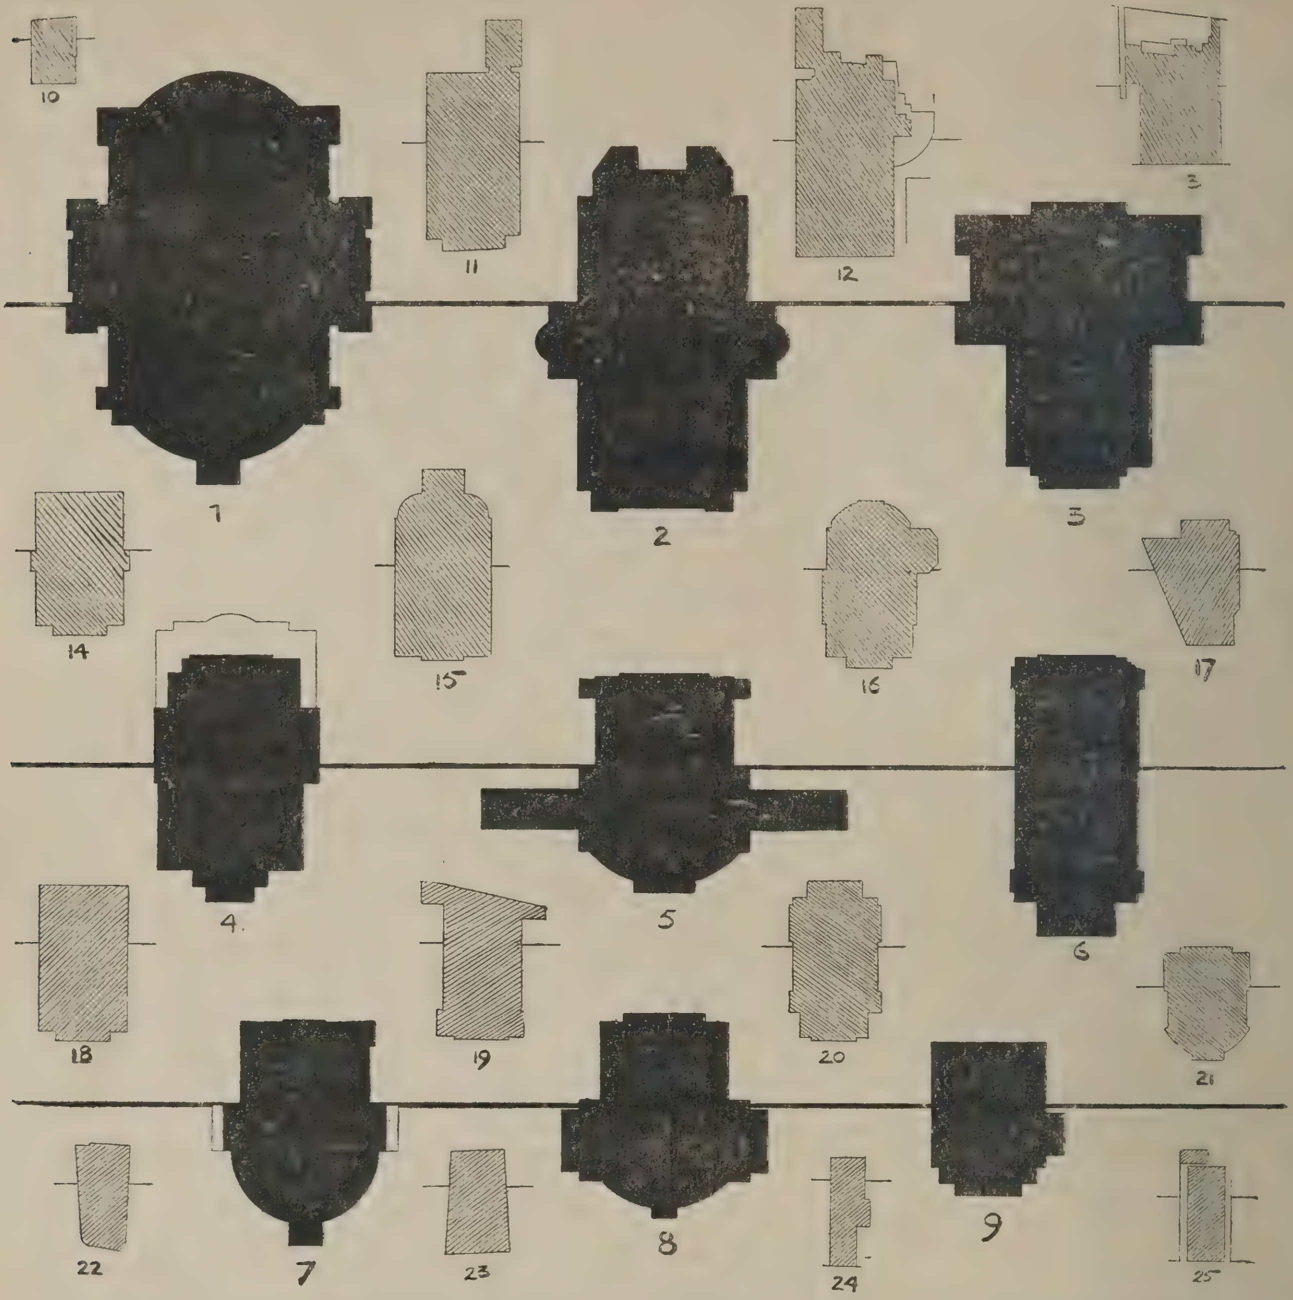
THE BUILDING.

General.—Taken generally, Continental theatres were oblong in plan; in some cases the front was rounded, showing the outline of the auditorium, and in some instances there were wings on either side of the main block. The audience were always above street-level, and the building was always distinctly divided into two parts: the so-called front and back of the house. As the modern Continental stage required great height, the grouping of the block generally showed this part of the building taken up separately to the prominent feature. There was seldom any attempt nowadays to put the whole of the building under the one roof. Continental theatres all showed symmetrical planning and ample dimensions, and there were few that appeared structurally badly built. The buildings had all been put up under watchful permanent authorities, who were guided by well-considered regulations, and have ample powers. They had nearly all been erected by men who had a horror of running the risk of a repetition of the Ring Theatre fire at Vienna. Architects had but seldom opposed safety legislation, or tried to avoid its requirements. The so-called front of the house was generally palatial in feeling, whilst the back had a utilitarian look about it. The lecturer regarded many of the municipal and subscription theatres as too palatial and too luxurious for their intended audiences. As to site, there were few modern theatres abroad that did not stand perfectly isolated; but an audience would be well cared for if only two sides of the block faced thoroughfares. Symmetrical planning was, the lecturer held, the first necessity for a theatre that was intended to be a safe one. The positions of all passages and staircases on outside walls was the second essential, and the possibility of approach to every part of the building from outside was the third. Now, all this was only possible where at least two sides of the block were perfectly free. To have the front of the site as well as the two sides free was, of course, a great advantage; but to have the main front, one side, and the back open would be far worse than to have only the two sides free. The chief advantages of planning a theatre in an open space were the greater facilities for the distribution of crowds and easier manœuvring for the fire-brigade.

Front of the House.—Dealing with approaches, entrances, and exits, the author showed that great care was taken on the Continent to facilitate the approach of the audience. Those who arrived by carriage would nearly always enter the building under cover, while those coming on foot had numerous advances from at least two sides of the building. Great care was taken to avoid draughts by having double or even treble sets of swing doors. Excepting in the grandest houses, all playgoers had to pass the main vestibule, where the box-office is situate, and this also applied to the visitors who took the comparatively few unnumbered seats. The symmetrical planning of the Continent allowed for the nominal division of the building into the "right" and "left," as seen when facing the stage. Tickets were issued for the right and left of the auditorium, and all passages and staircases were labelled on that principle. All passages and staircases could be used freely, and this, besides facilitating the finding of seats, taught the audience the nearest exits. The London system of allowing only one approach to each tier, whatever the number of exits might be, was radically wrong as far as the safety of the audience was concerned, although fewer ticket-collectors were thus required. On the Continent, though, all staircases and passages were approached from the main vestibule, and all had separate exits leading direct into the open without passing the vestibule. Clear planning was favoured abroad as distinct from intricate and tricky planning, and this even at the cost of much valuable space. Passing on to consider the passages, Mr. Sachs remarked that one of the chief features of Continental planning were the broad passages and corridors, and the fact that, with few exceptions, these passages ran round the two sides and back of the auditorium. The Continental theatre-goer had usually to take off his wraps before taking his seat, and it was a favourite plan to provide long counters off the passages, behind which there was ample storage room. These counters were so recessed as not to obstruct the passages. For cloak-room tickets, the plan of allowing a bin for each seat, and then giving the bins the same numbers as the seats, had been found very practical. The ladies were by no means so particular abroad as to their retiring rooms as in this country, and there was no objection to their being in a conspicuous position. The placing of lavatories off main passages, which we should consider faulty, was also *en règle* abroad. The passages generally had direct light, and were well ventilated. In regard to staircases, the grand staircase, the great feature of the old Continental theatre, was gradually disappearing abroad, and where found, its *raison d'être* was generally partly lost through their being quite sufficient staircase accommodation provided independent of its existence. The grand staircase was recognised as dangerous for the rapid exit of the crowd, as its pretensions and architectural treatment necessitated arranging it in broad flights. Flights of

---

[*] The illustrations on view included the actual working drawings of the late Hon. Correspondents of the Institute, Baron Hasenauer, Gottfried Semper, and Von Ibyl, who are respectively the architects of the Hofburg Theatre at Vienna, and the Dresden and Buda-Pesth Opera Houses. Russia was well represented by some finely-coloured drawings by Professor Schroeter, the Czar's theatre architect. The People's Theatre at Worms, which was one of the features of the evening, was illustrated by large sheets in body-colour. Drawings of the following theatres were exhibited:—Amsterdam, Municipal Theatre, Springer; Berlin, Lessing Theatre, Von der Hude; Berlin, New Theatre, Seeling; Brussels, Flemish Theatre, Baes; Dresden, Court Opera House, Semper; Buda-Pesth, National Opera House, Von Ibyl; Halle, Municipal Theatre, Seeling; Leibach, Municipal Theatre, Hrásky; Rotterdam, Subscription Theatre, Verheul; Schwerin, Court Theatre, Daniel; Stockholm, National Theatre, Anderberg; Vienna, Court Theatre, Hasenauer; Worms, People's Theatre, March; St. Petersburg Opera House, and Nischni-Novgorod, Rybinsk, Tiflis, and Irkutsk (Siberia) Theatres, all by Professor Schroeter.

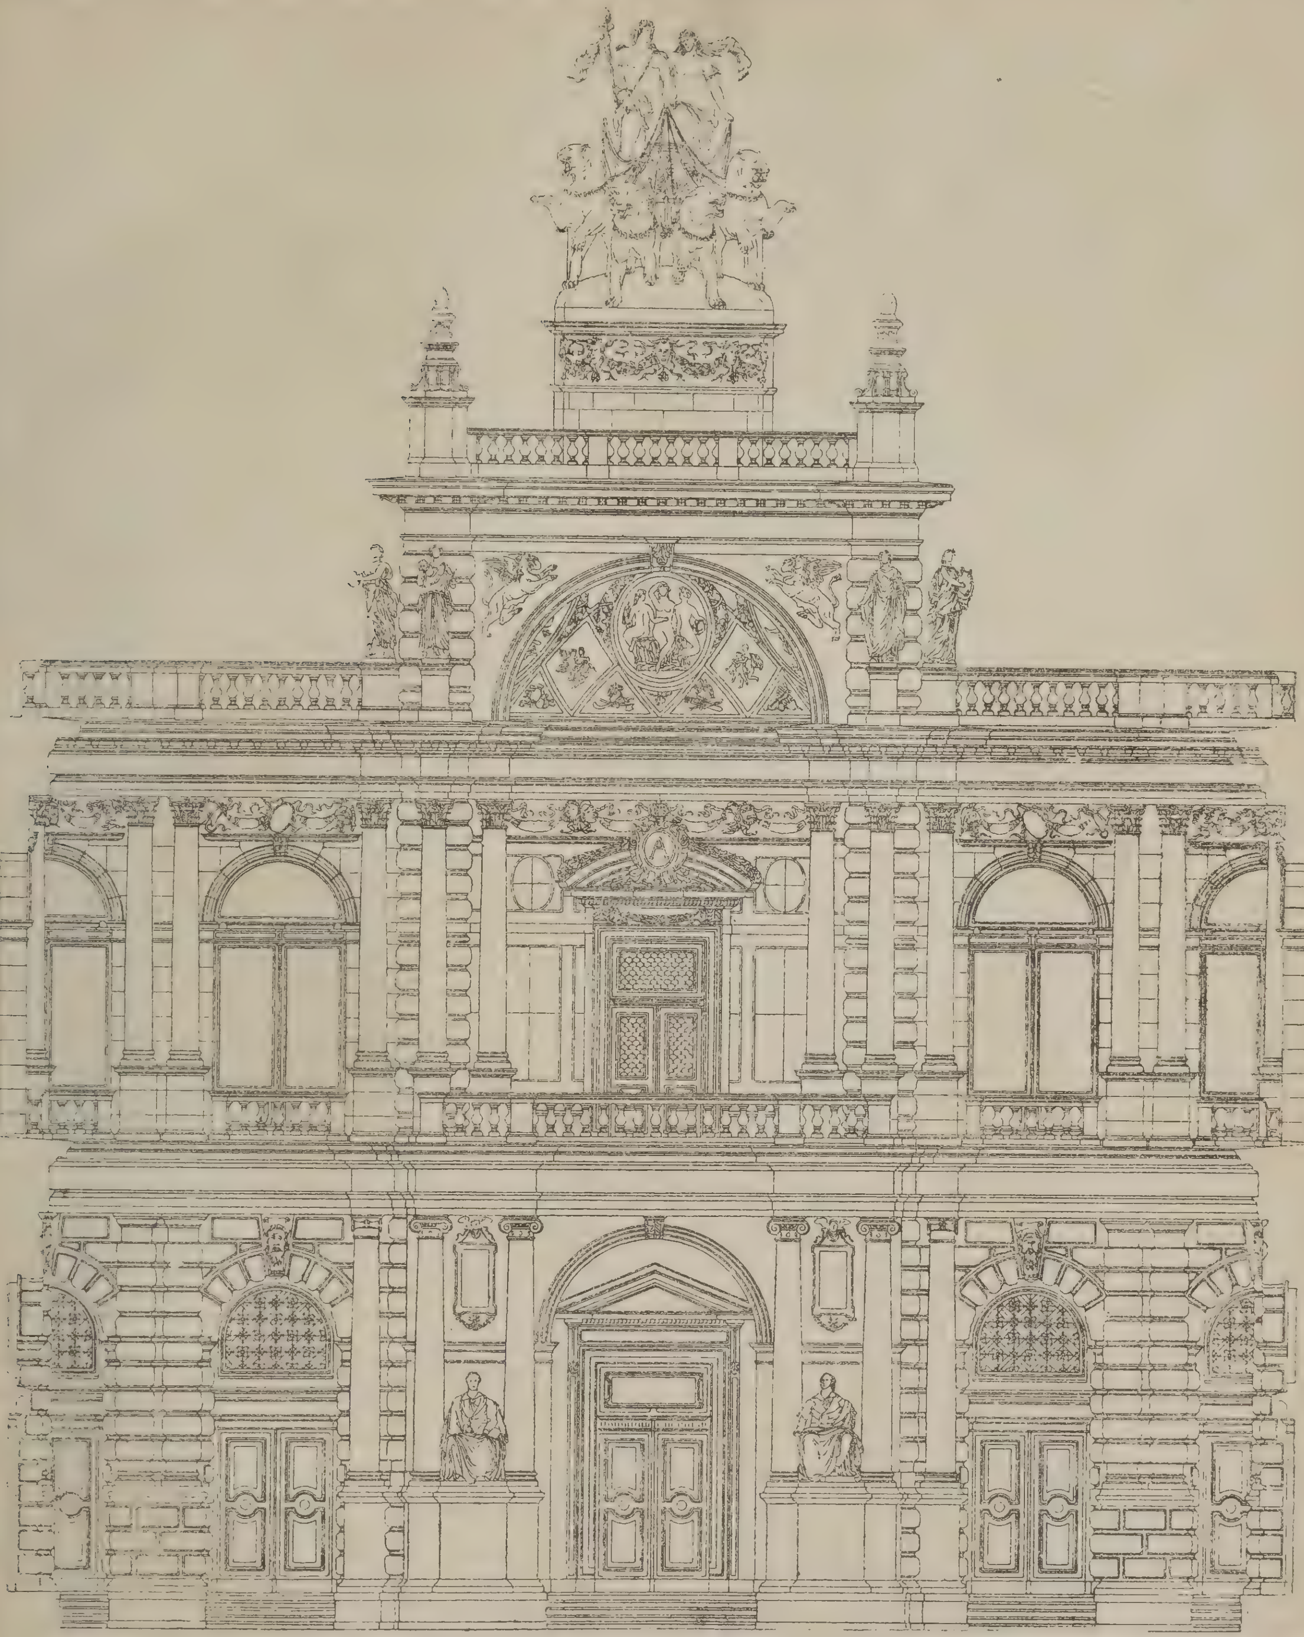


BLOCK PLANS OF MODERN CONTINENTAL THEATRES, DRAWN TO A UNIFORM SCALE.

Blacked-in Plans.—1, St. Petersburg Court Opera House; 2, Paris National Opera House; 3, Vienna Court Opera House; 4, Stockholm National Opera House; 5, Vienna Court Theatre; 6, Buda-Pesth Court Opera House; 7, Odessa Municipal Theatre; 8, Dresden Court Theatre; 9, Amsterdam Municipal Theatre.

Hatched-in Plans.—10, Royal Court Theatre, London; 11, Covent Garden, London; 12, Drury Lane, London; 13, Alhambra, London; 14, Fiume Municipal Theatre; 15, Buda-Pesth People's Theatre; 16, Halle Municipal Theatre; 17, Lyric Theatre, London; 18, Zurich Municipal Theatre; 19, Berlin "New" Theatre; 20, Berlin Lessing Theatre; 21, Laibach Municipal Theatre; 22, Savoy Theatre, London; 23, Shaftesbury Theatre, London; 24, Terry's Theatre, London; 25, Trafalgar Theatre, London.

staircases which allowed more than four persons to ascend abreast were dangerous on account of stumbles. There was the makeshift of a light iron railing running up the centre of a broad flight, but those bars spoiled the design of any staircase. At Copenhagen these were demanded by the regulations, and the effect was always atrocious. The modern Continental architect had three systems of staircase arrangement—the "central," the "radial," and the "corner" plan. The first allowed of a grand central staircase, generally without direct light, or at the most a top light. On either side of this grand staircase the minor flights were grouped. The Stockholm Theatre and the Frankfort Opera House were examples of this system. The radial plan allowed of the arrangement of the staircases in a row, concentric with the back wall of the auditorium. The staircases to the first tier were then generally on either flank, and were frequently treated as minor grand staircases. The Dresden Opera House and the Odessa Municipal Theatre were examples of two varieties of this system, one with direct lighting and the other without. The Lessing Theatre at Berlin was an example of the former system: there was no grand staircase, and the stairs leading to the best seats only showed a slightly superior architectural treatment. From an architectural standpoint, the disappearance of the grand staircase was to be regretted. The radial system of staircases was gaining ground already, and was the best for the quick distribution of the audience. Dealing next with the foyer, or crush room, the author remarked that this was perhaps the most important feature of the modern Continental theatre. We find, Mr. Sachs added, what I will call the "hall" foyer, the "group of rooms" foyer, and the "promenade" foyer. The first is generally a spacious rectangular hall, situated over the main vestibule. It serves as the assembly room for the patrons of the better seats who stand about and chat during the long *entr'actes* allowed abroad. The hall is, generally speaking, used for receptions, and fequently also for concerts. No concert would, however, be given at the same time as the performance on the stage, for the staircase and passage accommodation would not be sufficient. Where there are groups of rooms the smaller ones are, as a rule, provided with chairs and lounges arranged drawing-room fashion, while the larger one is used as a kind of miniature promenade. Foyers, arranged on these lines, cannot well be used for concerts, but small receptions can, of course, be held in them. The Schwern theatre affords an example of the large "hall" foyer, while the Buda-Pesth opera-house shows a set of crush-rooms. The "promenade" foyer is the most satisfactory one; it best fulfils the requirements of those who wish to easily stretch their limbs and meet their friends between the acts. A stroll will refresh the playgoer, but must not be a monotonous one. The long narrow foyers of the Paris or Vienna opera-houses are already very satisfactory; but the curved promenades of the Dresden Opera House, the Vienna Hofburg Theatre, or the Odessa Theatre stand first. The curved foyer goes hand in hand with the radial staircase system already spoken of. Most of the curved foyers



DRESDEN OPERA HOUSE.—CENTRAL FEATURE OF FRONT ELEVATION.

Architects: Gottfried Semper and Manfred Semper.

have a roomy lobby at either end, where one can step aside for conversation. The foyers abroad nearly all have balconies or terraces connected with them, and these are much used in the summer. Doors from the foyers generally lead directly on to them, and the absence of any lobby is unfortunate. In Court theatres there is often a small central balcony or open loggia, and it is necessary to have some suitable, prominent point from which any demonstration outside the building can be duly acknowledged. The bar in connection with the crush room is generally only a kind of provisional table at the end of the room, around which a few tables and chairs are arranged.

As to the modern auditorium abroad, its principal feature is the absence of any boxes in our sense. The balcony has almost become universal, and though there are nominally boxes which allow parties of four, six, or more persons to form a group for themselves, they are not shut off pigeon-hole fashion as formerly. The ante-room for the box is also fast disappearing. The only boxes, in our sense, are generally the large open ones on either side of the proscenium opening in the general proscenium frame. The other so-called boxes are simply formed by dividing up the balconies with low partitions, and giving each division its own door. A compromise arrangement will be found in Semper's work The partition between his boxes is carried up, but is so cut away as to prevent the disadvantages of the pigeon-hole system without completely destroying all privacy. In a Court theatre, the large boxes on either side of the proscenium already referred to would be reserved for royalty, but the Court would also have a large open central box on the first tier. The side boxes are used for private visits, and the central box on State occasions only. These grand Court boxes are frequently most curious mechanical contrivances, which can be enlarged or made smaller at will. They are generally cut through two tiers, and are covered with a baldacchino. The auditorium is frequently turned into a ball-room abroad by putting in a temporary parquet floor on tressels level with the first tier. At times this floor is even extended right over the stage, which is then decorated as a kind of bower. Small Courts give their balls at the theatre if the palaces do not afford sufficient accommodation. Very few architects have been able to design an auditorium so that the temporary floor does not make it appear an architectural monstrosity. When speaking of the arrangement of the auditorium abroad, Mr. Sachs pointed out the ample seating and gangway accommodation provided, and the great care now taken to give every two or three rows of seats its own door. Herr Seeling shows the best example of safe seating in his Halle Theatre. Referring to the construction of the auditorium, he would only point out that there is no such excellent cantilever work abroad as is to be found in our Palace of Varieties. The latest development of iron and steel construction abroad shows the surrounding wall of the auditorium entirely built up of girders and plates; this is on account of the large number of flues and ducts that have to be found room for in Continental theatres. The Hofburg Theatre at Vienna affords an example of this system. Of course, if an auditorium of this construction. ever does get well alight, it means the immediate collapse of the whole structure. As to the architectural treatment of the auditorium, the ceilings are no longer designed so as to appear to be resting on nothing, but are visibly carried, preferably by Kariatides. The heavy columns in the French theatres are things of the past. The decorator and upholsterer are no longer permitted to use the stereotyped red and gold. Blues and rich yellows are finding favour in the upholstery, and white, picked out with gold, for the walls and cornices. The ceilings are kept quite light, preferably white, picked out to match the upholstery. As to the furniture, the tip-up seat with a small side-arm has become almost universal. It is well padded in the better parts of the house, but bent wood is a favourite for the cheaper seats. As the buildings abroad are only licensed to hold a certain number of seats, and this condition is very stringently enforced, benches which can be crowded are of no use to the manager, even in the cheap parts of his building. Hats and coats are mostly left outside, so that no provision need be made for these. The numbering of seats is always in plain block letters, odd and even numbers being allotted to the left and right of the house respectively.

The Orchestra.—The dimensions and position of the orchestra, of course, vary greatly, according to circumstances. A small house, Mr. Sachs, for instance, noticed had a string orchestra stowed away behind a grille in one of the upper boxes at the side of the proscenium. These upper boxes are generally almost valueless to the manager, and hidden music is very fascinating. The grille should be of bamboo, for iron gratings would change the sound of the music. We generally, however, find the orchestra abroad in its usual place, just in front of the stage, though generally sunk deeper into the floor than in England. Wagner always made a point of having a sunk orchestra for his operas, and he built one on these lines in his Bayreuth Theatre. What is desirable for Wagner's music does not, however, hold good for a light opera by Strauss or Sullivan, and hence the new invention abroad of a movable orchestral floor regulated by hydraulics. The first movable floor was completed last month at the new Wiesbaden Theatre. The idea is very good, and there is little doubt that it will soon be introduced in all theatres which have a great variety of programmes. Most orchestral wells abroad can of course, be made larger or smaller to suit special requirements—an extra row of stalls is either put in or left out. Great care is taken to provide good exits for the orchestra, and no connection between the stage, mezzanine, and orchestra well is allowed.

Safety.—Passing from the "front" of the house, Mr. Sachs said a few words as to the safety of life in theatres. To his mind, life is of major importance, and the building of minor consideration, and this especially held good in this country, where losses by fire count for nothing. Where life is the only consideration, perfect means of exit in case of panic comes first, and then the reduction of the risk of panic caused by fire by good lighting and warming appliances, cleanliness, careful stage management, slow-combustion stage plant, and perhaps the isolation of the building. As long as the staircases are well planned, they can be of wood. Fire-extinguishing apparatus is almost superfluous. If the property is to be saved, the building must be divided into a number of "risks," both horizontally and vertically. It should be built of slow-combustion materials, should have its own well-manned fire-extinguishing appliances, and not be too far from organised outside help. Whatever care is taken to save the audience, it will not count for much if they cannot keep their heads; and, likewise, whatever is done for the building, it is minimal compared to the advantages of the manager and his employés being practical men who are cool in all emergencies. One stage-carpenter's pluck and smartness, his cap and coat, have saved hundreds of lives that must have been lost had there been a panic in one of our mouse-traps.

Stage.—The most remarkable features of the Continental stage, according to Mr. Sachs, are the appliances. Stage mechanism is being treated as a science. Capable, scientifically-trained engineers replace the stage carpenter of old. The only wood to be found nowadays on or about the stage is generally in the stage door, and here hard oak or teak is used. But the reform is a *bonâ fide* one—not merely an adaptation of the old stage to suit modern requirements. The monstrosity of rows of "flies" and footlights which throw their glare upwards on the actor's chin instead of downwards on to his forehead are gradually being done away with, and the streak of limelight that used to follow the actor about will soon be forgotten. Mr. Sachs's arguments were here illustrated by some clever sketches of Prof. Herkomer, R.A. There are two systems of mise-en-scène: one requiring a close imitation of nature, the other attempting the simplest indication of general surroundings. For the imitation of nature, the so-called "horizon," the careful grouping, and the rational method of lighting are as essential as the scene-painter's handiwork. For the indication of surroundings, all attempts at perspective should be avoided. A well-painted background and monochrome drapery, instead of "flies," will suffice. The skill of the first-class engineer will only be required where the possible imitation of nature is needed, and with hydraulics at his disposal he will be able to supply any want of the artist, and this without any cumbersome crowding of the stage with all manner of platforms and supports. The system of the Vienna Asphaleia Company, the first attempt at entire reform of modern stage appliances, is gradually being improved upon. The great reformers of the modern Continental stage are the engineers Brandt of Berlin, Christofani of Buda-Pesth, Brettschneider and Rudolf of Vienna, Lautenschlaeger of Munich, and Richter of Darmstadt. As far as the risk of panic and fire is concerned, the iron stage does not, perhaps, have quite as many advantages as are generally ascribed to it. The canvas scenery always remains, and if it does commence to burn, the heat engendered will soon destroy everything, and probably the iron roof first. Electric lighting is, of course, a great improvement so far as safety is concerned, but absolute reliance on immunity from fire on account of its introduction would be reckless indeed. Some authorities regard an iron stage lighted by electricity practically safe. At Warsaw, Mr. Sachs visited the Opera House, which was being renovated regardless of expense, and found that the architect had purposely not allowed for an iron curtain, on account of the electric light and modern stage machinery. Of the disadvantages of iron stages, mention was made of their effect on the acoustics of the building, the difficulty of giving the stage a comfortable temperature in winter time, and, further, the greater risk of accidents to the *employés*. To improve the acoustics, the top of the stage is generally kept full of canvas, and this, of course, means an extra risk. Sprinklers, for instance, cannot be as effective where the streams of water are constantly blocked by rolls of canvas. When a fire has actually broken out on the stage, reliance is almost placed in the fireman, with the buckets of water, and then hydrants, being close at hand. Next come the sprinklers. The ventilation flue over the stage and the first divisional iron curtain are to prevent the spread of fire in the direction of the auditorium. Hydrants, with good reliable pressure, and hose and branch attached, ready to be run out, are always provided in great numbers in Continental theatres, and the cock can generally be opened with one movement only. Sprinklers are very common abroad in the new theatres; the rows are generally divided into sections, so that if necessary the force of water can be localised in one particular spot, and the danger of unnecessary water damage avoided. The ventilation flue, which is nearly everywhere found over the stage, and can be easily opened, is considered a safeguard for the audience in the case of the hydrants and sprinklers failing, as the smoke and fumes will be drawn away from the auditorium. The danger of having ventilators is the possibility that they may be opened too soon, before any water has been brought to play on the fire, and that the flames will thus be fanned and the spread facilitated. The divisional curtains are everywhere introduced abroad, and at present the only question ever raised is as to the advisability of having double curtains, either in the form of a second asbestos protector or a water-sheet. Without a ventilation flue over the stage the curtain will be pressed into the auditorium by the expansion of air on the stage. The lecturer here showed drawings illustrating the stages of the Buda-Pesth National Opera House and the Halle Municipal Theatre, both carried out by the Asphaleia Co., of Vienna; the Vienna Hofburg Theatre, of which Herr Brettschneider, of Vienna, was the engineer; and the Rotterdam Municipal Theatre, Herr Rosenthal, of Cologne, engineer. They showed respectively the original Asphaleia system, the improvements of Herr Brettschneider, and, finally, a simple adaptation of the old wooden stage with modern resources. The only thing remarkable about the stores in Continental theatres was the ample space allowed, both where the main stores were in the same block as were the audience, and where there was only a secondary store the main storage being outside the building. Where main stores were inside, there was always a double wall some 4ft. apart between the stage and the stores to prevent spread. In some cities the main stores had to be outside the building. This, of course, meant much wear and tear, and extra labour for the management. The St. Petersburg and the Paris theatres had very extensive buildings for storage purposes only. Dressing-rooms were generally well arranged on the Continent; but the absence of bath-rooms was remarkable, and the lavatory accommodation did not come up to our requirements. Proper arrangements for curling-irons and paint-warmers were seldom to be found, though very practical electric ones had been invented. In conclusion, the lecturer described the people's theatre at Worms, in which a theatre and assembly hall are combined. (See plan, section, and elevation.*) The building seated 1,200 or 1,400, and had 33 exits, and cost just on £30,000. Herr Otto March was the architect.

The PRESIDENT, in inviting discussion on Mr. Sach's paper, remarked that we had in this country only two theatres built on the sumptuous scale familiar on the Continent, the Palace Theatre and the Shakespeare Memorial at Stratford-on-Avon.

Mr. RICHARD ROBERTS, Chairman of the Theatres Committee of the London County Council, observed that while he had been for some years in favour of a municipal theatre, which he regarded as desirable from the people's point of view, and also from an architectural standpoint, he entertained considerable doubts as to whether the English were sufficiently educated to appreciate such an institution. The failure of the Royal English Opera House seemed to suggest that the English were not an artistic nation. One reason for the greater popularity of the music-hall and variety entertainment over the drama proper was the great expense attendant on going to a theatre. For himself, he should like to see a municipal theatre established, with a school of dramatic art attached to it, and it might be that such a school could be subsidised by the London County Council; but without a subsidy of some sort success could not be predicted for such a movement. It was singular that in this country wealthy citizens did not endow a theatre, as was so often done for churches, hospitals, or free libraries. He held that the site of a theatre ought to be perfectly isolated on every side; at present the L.C.C. had only power to insist upon making one-half of the site free, and even that was regarded as a burdensome restriction by managers. The architects of theatres were, he suspected, very much what managers made them, for they were bound to carry out their clients' instructions.

---

* The illustrations we publish are from specially prepared tracings, the property of Mr. Sachs.

Mr. Mulholland, proprietor of the Camberwell Theatre, pointed out that however desirable a municipal theatre, subsidised by the ratepayers, might be in the interests of dramatic art, there were objections to such an institution. One of the principal was that where a single controlling mind did not regulate all that was undertaken the business was generally an artistic and commercial failure. A municipality would prove a cold and unsympathetic stepmother to art. He thought the plans of theatres should be submitted to a permanent authority of experts, who should promulgate and adhere to a definite code of constructional rules. Managers provided as good a theatre as was consistent with regard for £ s. d.

Mr. A. L. Leon, a member of the Theatres Committee, L.C.C., thought great objections would be raised by householders to a rate-supported theatre, which, moreover, would not thrive in this country. The Theatres Committee were often asked to sanction iron doors in theatres, but he would ask the lecturer if they did not involve considerable risk. The County Council were bound by the requirements of the Building Act in their restrictions on theatres, but when they sought to amend the provisions they found that managers were not agreed as to the changes they desired. If there was to be an improvement in theatre architecture public opinion must lead the way, and a permanent body would be less likely to be sensitive to progressive public opinion than one liable to re-election.

Mr. Thomas Blashill, F.S.A., superintending architect L.C.C., said he had inspected many of the Continental theatres described by Mr. Sachs. There was hardly one in a little German town but was so well isolated on all sides that you could drive two or three carriages abreast round it, whereas there were only two in the Metropolis round which one could drive, and a few others with a clear footway surrounding them, and many were only clear on two sides. English theatre architects went the wrong way to work in planning; they first arranged their auditorium and stage, and fitted the exits into whatever corners could then be afforded, whereas the first requirement should be to provide sufficient staircases and passages, and utilise the area then left. There should be provided covered accommodation outside for the protection of those waiting to enter on rainy evenings. The stores should be separate buildings, whereas in many cases the scenery was piled up beneath the stage, and sometimes looked as if laid for a fire. He experienced great difficulty in insuring that all exits were used; in one case he found, at 9 o'clock, during a performance, that every door was locked, and the manager had the key in his pocket. Each tier should have an independent entrance. If the theatres were under the control of a permanent body, managers might rely upon it that two of the requirements would be a 40ft. clear street all round the building, and an isolated store-house for scenery.

Mr. W. D. Caröe pointed out that the value of land was immensely greater in London than in little German towns. The theatre at Exeter destroyed by fire, when many lives were lost, was entirely isolated. Mr. Mulholland suggested that London theatres were the best that could be provided for the available means, but architects thought that much money was wasted on gilding, fibrous plaster, and other gewgaws, and he thought that, for the same expenditure, a little real art could be introduced.

Mr. Sachs, in acknowledging the vote of thanks, which was carried by acclamation, said he did not know of a single municipal dramatic school; the only school of the kind was that supported by the late Czar, which numbered 125 pupils. In Germany, when a lessee was engaged by the municipal authority, he was allowed to do as he liked during his three or seven years' term. In reply to Mr. Leon, he must say that iron doors were very bad arrangements; even if kept closed, they were sure, during a fire, to bulge on one side, and so allow flames to pass through. The best construction was an oak or teak door, double ledged, with an asbestos framing, and, perhaps, a light iron plate on the surface. He fully endorsed Mr. Blashill's views as to the necessity of isolating stores for scenery; no more scenery should be allowed in a theatre than was required for two plays.

Major-General Hutchinson, the Board of Trade inspector, on Tuesday week inspected the new section of the Newport Corporation tramway system, which extends over Newport Bridge to Maindee and Barnardtown.

OBITUARY.

We announce with much regret the death of Herbert Augustine Keates Gribble, A.R.I.BA., the architect of the Brompton Oratory, which took place at his residence, 64, Redcliffe-road, South Kensington, after a long illness, on Saturday last. Mr. Gribble was still comparatively young, not having completed his 48th year; but his career, although brief, had been brilliant. He was born at Plymouth in 1847, and showing at an early age evidences of good ability in drawing, he was articled to the late Alfred Norman, J.P., of Plymouth and Devonport, who, in conjunction with Mr. James Hine, was joint architect of the Guildhall and Municipal Buildings at Plymouth. While still a pupil he entered the Plymouth School of Art, and was successful in winning five medals and two national medallions for architecture and for decoration; the national gold medal for Gothic architecture, and other medals from the Royal Cornwall Polytechnic and the Albert Hall Exhibitions. He also gained the prize awarded in connection with the "Building News Sketch-Book" by his drawing of the north transept of Westminster Abbey. This sketch, numbered 17 in the series, appeared in the Building News for February 4, 1870, but had been executed some three years earlier. When in his 20th year Mr. Gribble was engaged by the late Mr. Joseph Hansom, architect (and inventor of the cab known by his name), as head draughtsman, and Mr. Gribble remained in his office for a period of over ten years. He then commenced practice for himself, and soon afterwards submitted a design for the proposed oratory at Brompton to the Oratory Fathers. A competition for the building was then instituted, and this was won by Mr. Gribble, as is well known, by a scheme based on the lines of his first sketch, and this design, which was illustrated by a double-page perspective and an interior, elevation, and plan in our issue of May 2, 1879, has been carried out. Other of his works are the Roman Catholic churches at Sevenoaks and of the Perpetual Adoration, London, N.W.; the National Armada Memorial at Portsmouth (illustrated by us, May 4, 1888); the premises of Messrs. Goad and Sons, marble merchants, Millbay, Plymouth; additions to the Convent at Plymouth (see our illustration, Feb. 24, 1888), and the R.C. church at Devonport; artisans' dwellings at Plymouth; the reconstruction of the West Hoe Pier at the same town, after its destruction by a gale; an altar at St. George's Cathedral, Southwark; and the high altar and campanile of the R.C. Church of the Holy Name at Poona, India, the last two respectively illustrated in the Building News for April 26, 1889, and Aug. 29, 1890. Mr. Gribble was an active member of the Architects' Registration Committee from its foundation. His clear-cut, dark features, and vivacious manner, and ready and fluent speech, made him a prominent member at any meeting in which he took part. He joined the Institute as an Associate in 1878. His portrait appeared with a biography in our issue for June 6, 1890. He leaves a widow, a daughter, and a son, Bernard, who has already won some distinction as an artist by his waterside sketches in oils and water colours.

Mr. John Welch, formerly a prominent architect in Brooklyn, N.Y., died suddenly a fortnight ago, at the age of 70. Mr. Welch was a Scotchman by birth, and was trained to his profession in Scotland and England. His first important building in the United States was a church at Newark, N.J., built in 1859. From that time until recently he had been chiefly engaged in church-building, his best-known work being Dr. Talmage's Tabernacle, built in 1872.

Colonel Von Cohansen, the well-known archæologist, and Keeper of the Antiquities of Nassau, died at Wiesbaden on the 3rd inst. in his 83rd year. He was one of the most painstaking investigators of the Limes Germanicus, the line of walls, castles, watch towers, and embankments erected by Adrian in South and West Germany against the Germans. These fortifications, at some points double and triple in construction, and about 360 miles in length, begin at Kelheim, and run over the Spessart, Vogelsberg, and Taunus Mountains to the Valleys of the Ruhr and the Lippe. Colonel von Cohansen wrote a number of essays on this subject, and also published monographs on Cæsar's bridges over the Rhine, the Roman quarries in the Bergstrasse (between Darmstadt and Heidelberg), and the antiquities in the valley of the Rhine. So far back as 1840 he left the army to undertake the management of the potteries at Mettlach. During this part of his career he was also engaged in architectural work. He entered the Engineers in 1848, excavated old fortifications and graves on the Hansrücken, in Rhenish Prussia, 1850 and 1851, and studied Mediæval fortifications in Prussia Proper and Italy in 1857. In 1870 he was chief engineer at Minden and at Coblentz. After the war he was appointed Keeper of Antiquities at Wiesbaden. In 1874 he was called to the Managing Council of the Roman-Germanic Museum at Mayence, to that of the Germanic Museum at Nuremberg in 1885, and, finally, to the Imperial Commission on the German Limes.

CHIPS.

New central board schools are in course of erection at Millbrook, near Southampton, at a cost of about £5,000. Mr. A. F. Gutteridge, of Southampton, is the architect, Mr. H. Cawte, of the same town, the contractor, and Mr. H W. Randall the clerk of works.

The theatre at Newcastle-on-Tyne is about to be remodelled, under the supervision of Mr. Walter Emden, of London, and Mr. W. L. Newcombe, of Newcastle.

At the meeting of the Bristol city council on Tuesday it was reported that Mr. Frederick Ashmead, who has been city surveyor since 1854, had retired, and been appointed consulting engineer at a salary of £500 per annum, and that in his stead Mr. Thomas Henry Yabbicom, who has been in the employ of the council for 26 years, and has been deputy surveyor for the past three years, has been appointed city surveyor at a salary of £500 per annum.

Mr. Thomas Codrington, M.I.C.E., an inspector of the Local Government Board, on Friday, held an inquiry at the Guildhall, Canterbury, with reference to the proposal of the corporation to borrow money for drainage and street improvements at Hanover and Norman-roads and for works at the Sewage Farm.

The Council of Egyptian Ministers have approved the appointment of Sir Benjamin Baker as Technical Adviser to the Department of Public Works for the reservoir at Assouan.

The members of the Liverpool centre of the Sanitary Inspectors' Association held their seventh annual dinner at the Washington Hotel, Lime-street, Liverpool, on Saturday evening. The city engineer, Mr. H. Percy Boulnois (president), occupied the chair.

At the meeting of the Town Council of Bury, Lancs, on Friday, it was stated that Earl Derby had given 2½ acres of land, worth £1,000, as an addition to the recreation grounds in Walmersley-road.

Mr. James Anthony, Clun, has now completed his contract for repainting and rebuilding the inside of the walls of the Old Castle, for the Duke of Norfolk. The keep has also been fenced in with iron palisading, and the work has been carried out under the supervision of Mr. R. Parry, The Lodge, Lydbury North. It is the Duke's intention, next spring, of having the outside of the castle walls and buttresses put in through repair.

A Local Government Board inquiry into an application of the Birmingham City Council for sanction to a loan of £23,400 for the extension of the Scarlet Fever Hospital at Lodge-road was held at the Council House, Birmingham, on Wednesday.

The Sun Insurance Company is issuing a series of handy and tasty desk-calendars, date-cards, and blotting-books, as useful as they are tastefully designed. It is old association possibly, but we always look on the *Sun* as especially the architects' and builders' Insurance Company, and its well-known badge as an indispensable feature of the decoration of any structure worth guaranteeing against loss.

The Wednesbury town council have appointed Mr. G. Pritchard, engineer, of Birmingham, to carry out the extension of the Wednesbury sewerage scheme, which is estimated to cost between £7,000 and £8,000.

The Bishop of Gloucester and Bristol dedicated, on Wednesday week, a wing which has been added to Dr. Bell's Schools at Fishponds, near Bristol. The alterations have cost £1,000, and have been carried out by Messrs. G. Humphreys and Sons, of Stapleton-road, Bristol, the architect being Mr. W. L. Bernard. The Bishop afterwards proceeded to the infants' school erected in connection with the Diocesan Training College in Manor-road. The site was presented by the principal of the training college, and the cost of the undertaking, apart from the site, is about £2,300. Mr. W. V. Gough was the architect, and Mr. H. Rossiter, Bedminster, was the builder.

Building Intelligence.

Hereford.—St. Martin's Church, Hereford, built in 1845 at a cost of £5,000, is being enlarged by the extension eastwards of the chancel. The new walls are built of stone from the Three Elms quarry, with grey Bromsgrove dressings, Bath stone being used on the inside. The inner chancel roof is of panelled oak, which will be decorated with carved bosses. A new chancel arch has been erected. The floor is to be laid with encaustic tiles, with oak blocks under the stalls, which will also be of oak. A new pulpit is being provided, and an organ-chamber built at the angle of the chancel and north transept. In the nave the old boarded floor with the stone paving in the passages has been taken up, a bed of concrete laid down, and upon this will be laid a flooring of oak blocks, with tiles in the aisles. A hot-water heating apparatus will be provided. Messrs. Nicholson and Sons, of Hereford, are the architects, and Messrs. Beavan and Hodges, with Mr. H. George as their foreman, the builders.

Islington. — An underground convenience, which has been constructed for the Islington Vestry in the High-street, near the Grand Theatre, was opened last week. It is constructed under the carriageway, and comprises entrance and exit staircases, inclosed by wrought-iron railings, six w.c.'s, twelve urinals, lavatory with three basins, attendant's room, and two store-rooms. The roof is formed of pavement-lights, supported on steel joists, and is laid out as a refuge. The brickwork has been built in Portland cement. The interior is faced with white glazed bricks, with a plinth and dado of blue glazed bricks. To prevent the soaking of water into the brickwork, a horizontal damp course has been laid in all walls at the floor-level, the rear of the exterior walls has been twice coated with a boiling mixture of tar and pitch, and a backing of dry rubble has been put round the walls and drains, formed of channel-pipes, laid so as to discharge subsoil water through weep-holes in the exterior walls into gullies inside the convenience. The drains are formed of glazed stoneware socketed pipes, jointed with cement, and made watertight. They are ventilated into brick chambers in the carriageway, the chambers also acting as surface-water gullies. Doulton's "Simplicitas" w.c.'s have been used. The urinals have semi-circular backs of white glazed ware, with screens and backs of Rouge Royal marble. A special feature in the construction is a movable slab in the back, which makes the pipe to each urinal accessible without the removal of the whole of the marble back. The lavatory is furnished with Doulton's pedestal basins of the tip-up kind. All the frames of the doors and partitions have been set on chamfered bases of York stone 3in. above the level of the floor, in order to prevent their lower parts being injured by water splashed from the hose. The work has been designed by Mr. J. Patten Barber, M.Inst.C.E., chief surveyor to the vestry, and carried out by Messrs. Doulton and Co., sanitary engineers, London, Paisley, and Paris, the cost amounting to £1,510. The underground conveniences which have been constructed for the Islington Vestry in Parkhurst-road (near Holloway-road) by Mr. Geo. Jennings, Lambeth, from the designs of the chief surveyor, Mr. J. Patten Barber, were opened on Monday. The cost has been £2,640.

Leeds.—The new home for the nursing staff of the Leeds Union Infirmary at Burmantofts was opened on Friday. The building contains 40 separate sleeping apartments, mainly in the two end wings. There are also a large kitchen, scullery, store-room, and dining-hall. Owing to the sloping site, the ground floor meets the level of the land at the front, thus securing a full basement story the whole length of the block. Baths and lavatories are provided at the extreme end of the wings on the ground and first floors. Mr. Thomas Winn, of Albion-street, Leeds, is the architect. The cost of the building, including furnishing, has been between £10,000 and £11,000. Mr. J. T. Boothman has officiated as clerk of the works.

Newcastle-on-Tyne.—The building trade and its allied industries in Newcastle-on-Tyne seem—according to the *Newcastle Chronicle*—to be in a brisk condition, thanks to public and private enterprise, and it is estimated that more large undertakings are now in progress than have ever before been known in the history of the city. One of the corporate works is the extension of the City Lunatic Asylum at Coxlodge, at an estimated cost of from £80,000 to £100,000 in all. Another contemplated corporation undertaking is the formation of deeper water berths at Newcastle Quay, in order to make room for larger steamers, and the improvement of the quayside, a work that is to cost about £25,000. It is to be done under corporation official management, and not to be let to contractors.

Rotherham.—The workhouse has been remodelled on the old site. Immediately on the left of the large gates is the porter's lodge and office, with tramp and receiving wards for men and women. Further on is the central block with main entrance, having, on the left, stores and officers' rooms, and, on the right, master's house and offices. On each side of this block are men's and women's day-rooms, dormitories, and cottages for aged inmates and old couples, waiting-hall and stores, with a large dining-hall over, giving accommodation for 350 people. Continuing further are the children's day-rooms, also dormitories and attendants' rooms. The Tudor style has been adopted, the materials being Dunford Bridge wallstones and local stone for ashlar. The whole of the work has been designed and carried out under the personal superversion of Mr. H. L. Tacon, architect, Rotherham, the contractor being Mr. G. H. Smith, of Mexbro'. The cost, exclusive of furnishing, amounted to £26,000.

Sparkhill, Birmingham. — The Sparkhill, Greet, and South Suburban Technical Institute was opened on Monday. The building has been erected at a cost of about £2,600. It has seven classrooms on the basement and ground floors, which are fitted up for the accommodation of technical classes. Over these is a lecture hall, 73ft. by 30ft. A large assembly room will be erected at some future time at the rear. The design is in the Renaissance style, and is carried out in brick, with red terracotta dressings. The work has been carried out by Mr. Frank Davis, of Showell Green, from designs of Mr. Arthur Harrison, architect, Colmore-row, Birmingham.

Torquay.—Amongst the many improvements recently carried out by the Corporation of the Borough of Torquay have been some alterations to Cary Green, and arrangements were entered into between the Devon and Cornwall Banking Co., Ltd., and the corporation for alterations to the old site of the banking premises. The building was, therefore, taken down, and a new building erected on a portion of the site. The rusticated bases, as well as the face work of upper story, are built with hard red sandstone. The band sills and pilasters are of red polished Aberdeen granite by Messrs. James Wright and Sons. The remaining portion of ground-floor masonry and cornices are of fine-grain red Wilderness stone, the dressings to upper floors being of Ham Hill stone. The banking offices are fitted up with polished Spanish and other mahogany framing, doors, overdoors, counters, and desks of a high-class description. The buildings have been carried out by Messrs. Vanstone and Mumford, contractors, of Torquay. The architects are Messrs. Geo. Soudon Bridgman, M.S.A., and Norman G. Bridgman, A.R.I.B.A., architects, of Torquay and Paignton.

Engineering Notes.

Society of Engineers.—The 41st annual dinner of this society was held at the Holborn Restaurant on Wednesdary night, Mr. George A. Goodwin (the president) in the chair. The president proposed "The Army, Navy, and Reserve Forces," to which Mr. A. J. Durston (engineer-in-Chief to the Admiralty) and Colonel Davis responded. Mr. J. W. Wilson, jun., proposed the toast of "The Society of Engineers, the President, the Hon. Secretary and Treasurer, and Secretary of the Society." The president, in acknowledging the toast, said that the society was in a most satisfactory condition, and its financial position had never been so good as it was now. He referred to the death of their late hon. secretary and treasurer, Mr. Alfred Williams, their oldest and most valued member, who founded the society in 1854. Mr. Nursey and Mr. G. A. Pryce-Cuxson also acknowledged the toast.

"BUILDING NEWS" DESIGNING CLUB.

THIRD LIST OF SUBJECTS.

D.—A Country Parsonage in stone on a well-wooded site in an undulating country. The house is to be solidly built and picturesque in design, suitably planned for a married priest and small family. Economy of service is a necessity in such a household, and sources of dilapidation should be avoided, such as needless external woodwork constantly requiring repainting and repair. The accommodation required will be two reception rooms, about 330ft. super. each, a study about 10ft. by 12ft., having an easy approach for parishioners calling on the vicar on business; a meeting-room attached to the house, about 30ft. by 18ft., adapted for parochial purposes; kitchen, store-room, larder, pantry, scullery, servants' and garden w.c.; upstairs, six bedrooms, bath-rooms, and w.c.; two bedrooms may be on a second floor. Style left to the designer. Scale, 3ft. to the inch; but, if necessary, the plans may be drawn to 1-16th scale. A view to be included, and, at least, one section. Two elevations will suffice.

Drawings Received.—"Just My Luck," "Flash in the Pan," "Sesame," "Calcutta," "Ageepee," "Tim," "Titch," "Artifex," "Gryph," "Chichevache," "Arnaud," "Ictinus 2nd," "Quaigh," "Kelly," "Minstrel," "Waterbouget," "Stabilitas," "1894," "Heather," "Nyoola," "Mac," "Albyn," "Gray Rat," "William of Sens," "Sphinx," "Lux," "Parramatta," "Bona Fides," "Wykehamica" (no address), "Esto quod es," "Storm Fiend," "Inkerman" (too late and unfinished).

Correspondence.

THE NEW LONDON BUILDING ACT.

To the Editor of the Building News.

Sir,—In the illustrations to my paper you have been good enough to insert in your current number, I find on p. 779 your printer has described the diagram showing the thickness of the walls as the thicknesses of the walls under the New Act, whereas the diagram was intended to show the thicknesses of walls under the Old Act, with the additional thickness required by the New, and which is shown by the additional line at the side.—I am, &c.,

Ellis Marsland.

Intercommunication.

QUESTIONS.

[11263.]—**Sewer.**—A drain was put in by the old turnpike road trustees in a populous district. The inhabitants have from time to time connected the house drains, and the original road drain is now carrying both sewage and surface water from the road. Who is responsible for the maintenance of this drain? Is it now a sewer under the Public Health Act?—Culvert.

[11264.]—**Golf.**—Can anyone, from experience, recommend to me a means of keeping clubs in good order Should oil be used for the shafts, and also for the heads of wood clubs? And if so, what kind?—Tee.

[11265.]—**Society of Antiquaries.**—I should feel greatly obliged if some kind reader would give the information as to what course to pursue to enable me to qualify for and become a Fellow of the Society of Antiquaries.—F. S. A.

REPLIES.

[11257.] — **Infectious Hospitals.**—The Local Government Board published in 1882 a supplement to the 10th annual report, and there is to my knowledge no other book on the subject; but much information can be obtained from the many books on Hospital Construction, for which see Mr. Batsford's catalogue.—H. L.

[11258.]—**Wall Sinking.**—Lay at a sufficient depth below the surface concrete of good width and depth. If the walls are already erected, and are sinking, I advise careful underpinning on a deep bed of cement concrete. What is the size of the building? Is there a story below ground?—H. L.

[11261.]—**Surveyors' Charges.**—The fees under Ryde's scale would cover the time occupied in negotiating the sale. Any charges for sundry services should be made to the client.—H. L.

[11262.]—**Licenses.**—A license is not required to enable an architect to measure and value artificers' work. —H. L.

* * *

On Saturday Lord Egerton of Tatton unveiled, at St. Mark's Church, Manchester, a window in memory of the late Hon. Miss Egerton. The window, which is placed above the altar, represents the Resurrection and the Ascension.

There is at present being erected in the Holy Trinity Church, Dunfermline, a grand organ, as a memorial of the late Hon. R. Preston Bruce. The organ, which is being built by Messrs. C. and F. Hamilton, Edinburgh, according to the specification of Mr. T. H. Collinson, St. Mary's Cathedral, Edinburgh, consists of two complete manuals and an independent pedal organ. The case, designed by Dr. Rowand Anderson, Edinburgh, and made by Mr. J. Slater, Edinburgh, is of an elaborate description.

Legal.

OVERHANGING TREES, ETC.

We now have the decision of the House of Lords upon a long-vexed question, which, though apparently trivial, contains some points of principle which may be of practical importance under some circumstances. In the case of "Lemmon v. Webb" (*Times*, 28 Nov.) the plaintiff sued the defendant for damage for cutting down some branches of trees that overhung his land, without having given any notice to the plaintiff before so doing, or allowing the plaintiff to cut them himself. He also asked for an injunction and a declaration that the defendant was not entitled to cut branches of trees which belonged to the plaintiff, and had been overhanging the defendant's land for many years without objection by his predecessors in the property. The judge at the trial had given a judgment in favour of the plaintiff, with £5 damages against the defendant, on the ground that he should not have cut down the trees without due notice. This was, however, reversed by the Court of Appeal, where the Lords Justices held that no notice was necessary, as the case was one of nuisance, and so there could be no damage in the lawful abatement of a nuisance. The House of Lords has now confirmed this ruling, and upon the same grounds.

It is, therefore, clear that an easement cannot be acquired for branches of a growing tree that spread over the land of another. This being so, it follows that the owner of the land over which these branches hang can cut them down, no matter how long they may have been allowed to hang there. For if there can be no easement the spreading branches always continue to be, as they began by being, a nuisance in the eye of the law. It is legal for an owner to abate a nuisance affecting his land, and the person guilty of the nuisance, being in the wrong, has no right, legally speaking, to any notice before the nuisance is abated. In this way we get at the judgment of the House of Lords, and see that if the defendant was within his legal rights in doing what he did, however unneighbourly and harsh his conduct may appear, he cannot be held liable in damages for not giving a notice to abate a nuisance, where no notice is by law required. In clearing building plots it might well be necessary to cut down overhanging branches, although they may be those of fine old trees standing and spreading for many years.

Fred. Wetherfield, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

Querist. — Co-agent. — Repairs.—Agreement.—You were wrong in retaining the instalments due, and they can now act upon the clause and cancel the agreement if they choose, as to doing future repairs. But I consider that the words of that clause, "such course shall not prejudice any right, benefit, or advantage," must mean that they are bound to do all the repairs that were then required at the time of cancellation; of course, upon your paying them all the overdue instalments.

X. — Council.—Election.—Resigning.—There would be a difficulty about refusing to sign declaration on election or resigning during term of office, unless for good cause. You should consult a local solicitor of experience in election matters.

Rex.—Shop.—Building Line.—The Board are entitled to make regulations as to the building line of new premises to be erected in an old road, and they have a discretion to insure a good width of roadway, which they especially insist upon for shops. The fact of there being no covenant in your lease as to this, makes no difference to the legal position of the local authorities.

LEGAL INTELLIGENCE.

House Drainage not Up to Date.—Mr. Edward William Hudson, A.R.I.B.A., F.S.I., of Fellows-road, Hampstead, answered an adjourned summons at the instance of the Vestry of St. Mary, Battersea, on Monday, in respect of premises at 29, Kersley-street, which were stated to be insanitary by reason of the soil-pipe being improperly constructed, and terminating too close to one of the windows. The case was a test one under the Public Health Act, London, 1891. It was stated that the system of drainage had existed at the house for twelve years, and was that of open soil-pipes, devised and still used by Mr. Norman Shaw, R A. (illustrated from this architect's own drawings in the Building News for Jan. 25, 1878). Although now tabooed by all Metropolitan sanitary authorities, when constructed it was in accordance with the latest sanitary requirements. A similar system was in force at New Scotland-yard. Mr. Pilditch, consulting architect and sanitary engineer, proved having made an examination of the soil-pipe to which exception had been taken, and failed to discover the existence of a nuisance. It was not the best form of drainage. Mr. Gover argued, for the defence, that the vestry had no power to interfere, as they had already sanctioned the existing system of ventilation. Although medical scientific discovery had advanced, the vestry could not compel private owners to keep their property up to the standard required by each new discovery. The drain could not possibly be more dangerous now than it was before science discovered its injurious effects. It was unfair to place owners at the expense of alterations because the vestry had got hold of new sanitary notions. Mr. Young pointed out that it was the duty of the sanitary authority to enforce necessary sanitary requirements in the district over which they had jurisdiction. He was unable to say that there was a nuisance, but a nuisance was likely to occur at any moment. Mr. Denman declined to hold that sanitary fittings were likely to produce a nuisance because they were not up to date in sanitary science. If that contention were allowed, it would mean that all old fittings would have to be pulled down and replaced. He dismissed the summons, but nevertheless thought that a temporary imperfection in the pipe should be remedied, and allowed three guineas costs.

WATER SUPPLY AND SANITARY MATTERS.

Portishead Sewerage Scheme.—The Portishead local board have received the Local Government Board's sanction to borrow £14,000 to carry out the works in connection with the proposed sewerage scheme, £12,000 to be repaid within 30 years, and £2,000 within 15 years. The works include eight miles of sewers of various sizes, a sea outfall, 136 manholes at an average depth of 11ft. 6in., about 100 iron ventilating shafts, air-compressing station with gas-engine air-compressors, cottage for attendant, ejectors, air mains, &c. Estimates will shortly be invited for the carrying out of the works, as it is proposed to commence operations without delay. Mr. T. J. Moss Flower, Assoc.M.Inst.C.E., Carlton Chambers, Bristol, is the engineer.

West Riding Rivers Purification.—Shipley Drainage —Major-General C. Phipps Carey held a Local Government inquiry at the Manor House, Shipley, on the 5th inst., with reference to the application of the Shipley Local Board to borrow £55,000 for the purposes of sewerage, sewage disposal, and the erection of a refuse destructor. Mr. J. H. Woodhead, civil engineer, having explained the system of sewers proposed for the Windhill section of the district, which are in the hands of his firm, Mr. M. Paterson, M.I.C.E., described the works designed by him, consisting of the main outfall sewers, the works of precipitation, and the land filtration works. The main outfall sewer, which is 17,118ft. long, the Valley-road outfall, and the Red Beck outfall, are the principal sewers, and present a combination of difficulties seldom met with in so small a compass, including seven tunnels, three of which are under the canal, a mill yard, and a mill respectively, cast-iron pipes along the river bed, several beck and railway crossings, and a heavy retaining wall at the River Acre. The premises of no less than eight mills, foundries, tanneries, and other large works are intersected, including the well-known Saltaire Mills, which are traversed for nearly 200 yards in tunnel. Pumping will be necessary. Pumps are to be provided capable of lifting an extreme limit of 4,100galls. per minute 47ft. high, steam for which will be raised chiefly by a Horsfalls destructor. A tank sewer, holding 280,000galls. storage; precipitation tanks holding 12 hours dry weather if low, or 1,120,000galls. will be provided. After precipitation the clarified sewage will be passed into 12½ acres of land adapted for filtration, chiefly gravel and a porous gravelly loam. Besides this area, 16 acres are reserved for the future needs of the district. After the inquiry, the inspector made a careful inspection of the site of the proposed works, specially examining the difficult lines of the outfall sewers. The population of Shipley is about 25,000, and storm water is at present turned into the sewers, but will be excluded in future extensions. Mr. Paterson pointed out the necessity of making proper provision for dealing with mingled storm water and sewage so as to satisfy the requirements of the West Riding Rivers Board, whose powers in this direction were greatly strengthened by their Act of last Session.

◆

A new Wesleyan chapel is being erected at Gorton-on-the-Wolds from the designs of Mr. J. Shepherdson, architect, Driffield. Special attention has been given to the ventilation, which will be carried out on the Boyle system, the latest patented form of the self-acting air-pump ventilator being adopted for the extraction of the vitiated air.

Our Office Table.

According to the *résumé* of the work of the corporation of Glasgow during the year 1893-4, prepared by the Lord Provost, Glasgow continues to flourish and prosper. The result of the transfers of the tramways to the corporation has been satisfactory from a financial standpoint, and month by month the receipts have shown a substantial increase. The council during the year has also resolved to proceed with the erection of a weir across the Clyde, the estimate for which is under £45,000. The Corporation Art Galleries have made rapid and steady growth in public favour, and it has been decided by the council that a people's palace shall be erected in the East-end, at a cost of £20,000. The demand for the electric light still continues to increase. The preliminary work has been started in connection with the erection of Ruchill Epidemic Hospital, and new city sanitary buildings are to be erected at a cost of £17,000. The success of the Dalmarnock sewage purification works is alluded to as giving hope for the purification the Clyde.

The Italian Minister for Education has issued a circular pointing out the serious injury often occasioned to ancient paintings by empirical treatment, and offering a prize of £120 for the best essay on the technique of painting, fresco, encaustic, and tempera, and on the results which have been obtained by investigations into the materials and processes used in these different kinds of painting. The essays, which must be sent in to the Public Education Department, Rome, not later than the 30th June, 1895, will be adjudicated upon by a Government Commission, assisted, if necessary, by scientific experts.

CHIPS.

Mr. John Joseph Faulkner, R.H.A., died on the 4th inst. at Adelaide House, Shepherd's Bush, aged 58 years.

The celebrated landscape painter, Count Stanislaus Kalckreuth, died at Munich on Tuesday week, at the age of seventy-four.

A Local Government Board inquiry into the proposed extension of the borough of Kingston-upon-Thames so as to include within it Surbiton, Coombe, Malden, Kingston Hill, Kingston Vale, and Southborough, is being held this week at the Assize Courts, Kingston. On the second day, Wednesday, the borough surveyor of Kingston was called, and detailed the difficulties which have arisen through the suburban portions of Kingston being governed by separate authorities.

A two-light window has recently been fixed at St. Paul's Church, Chippenham, Wilts, the subjects being those of St. Paul preaching at Athens, and the scene after the shipwreck where the Apostle shakes off the venomous beast into the fire. The subjects were painted by Mr. Kendrick Swaine Bourne, of the firm of Messrs. Swaine Bourne and Son, King Edward's-road, Birmingham, and London.

The Queen has granted to Mr. E. Law, B.A., the historian of Hampton Court Palace, the occupation of the small residence known as "The Pavilion" at the end of the Long Walk in the Palace Gardens.

A stained-glass window has just been placed in All Saints' Church, Clevedon, Somerset. The window consists of three lights, and is illustrative of Our Lord's Sermon on the Mount. It was designed and executed by Messrs. Joseph Bell and Sons, of College-green, Bristol.

The new post-office in process of erection in Chapel-street and Cambridge-road, Harrogate, has given rise to much local criticism, because of the alleged meagre character of the elevation, and the Postmaster-General has been communicated with on the matter, and he has replied to the effect that the suggestions made will receive attention.

St. Mungo Episcopal Church, Alexandria, N.B. which has been in course of construction during the past year, was formally opened on Sunday. The building has been constructed with the view to future extension, only the nave, 65ft. by 30ft., and porch being meantime completed. The church in its present form is seated to hold 250.

Mrs. Lane has had finished and has added to the canopies above the stalls on the south side of the chancel of St. Lawrence's, Ludlow, which she began some years ago in memory of her husband, late rector of Ludlow, and of her son. The carving is of oak, twenty-nine figures in all, seven apostles, with angels on either side of them, and six angels at the east end have been placed in the niches left for them. The work is being carried out by Mr. L. Turner, of London.

MEETINGS FOR THE ENSUING WEEK.

Monday.—Royal Institute of British Architects. "The London Building Act, 1894," by Professor Banister Fletcher. 8 p.m.

Tuesday.—Institution of Civil Engineers. Discussion on "Colliery Surface Works." 8 p.m.

Glasgow Architectural Association. "The Thirteenth and Fourteenth Centuries in Italy," by T. L. Watson. 8 p.m.

Wednesday.—Society of Arts. "Forestry," by Lieut.-Gen. J. Michael, C.S.I. 8 p.m.

◆

CHIPS.

The practice formerly carried on by the late Mr J. C. Moncrieff, F.R.I.B.A., at 26, Nicholas-street Bristol, has been taken over by Mr. Chas. A. Rowley, from the city surveyor's offices in that city, and will in future be conducted under the style of "Moncrieff and Rowley."

The Clothworkers' Company have lent their hall in Mincing-lane for the annual distribution of prizes to the students of the Royal Female School of Art, which will take place on Wednesday next, at half-past three p.m., under the presidency of the Master of the Company.

A temperance hall is about to be erected at Cardiff, the sole cost of which will be borne by Mr. John Cory, J.P., D.L., and is a memorial to the late Mr. John Cory, the father of the donor. The plans are now in the course of preparation by the architects, Messrs. J. P. Jones, Richards, and Budgen, of Cardiff, and the erection of the buildings will be commenced early in the New Year.

Maesteg School Board, Blaenllynfi schools, are being erected for the above school board. from the plans, and under the direction of, Mr. E. W. Burnett, architect, Tondu, Bridgend, and will be warmed and ventilated throughout by means of Shorland's patent Manchester grates.

Five architects have been invited to send in competitive plans for the public hall about to be erected in Viewfield-gardens, Selkirk, at the expense of a private donor, aided by a grant of £2,300 from the town council.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender; it adds to the value of the information.

Aberdeen.—For supplying engine, dynamo, and other plant for the extension of the electric lighting system, for the town council:—

Holmes, J. H., and Co, Newcastle-on-Tyne (accepted).

Bethnal Green.—For alterations to Excelsior Swimming Baths, Mansford-road, Bethnal Green. Mr. Walter Emden, 105, Strand, architect:—

Holland and Hannen	£1,339	6	0
Haskins, G. W.	1,100	6	0
Marshall, R.	1,098	2	0
Roffey, H.	1,031	6	0
Beer and Gash	1,029	0	0

[The lowest tender will be accepted, subject to deductions.]

Blackwood.—For the erection of the Masons' Arms, Blackwood, S. Wales. Mr. E. A. Lansdowne, Newport, Mon., architect:—

Richards, J. C., Pontypridd	£1,950	0	0
Williams, J. D., Knighton	1,790	0	0
Jones and Co., D. C., Gloucester	1,652	0	0
Haines, J., Cardiff	1,596	17	0
Davies, D., Cardiff	1,594	0	0
Davies Bros., Abersychan	1,500	0	0
Jones, W., Blackwood	1,484	0	0
Richards, A., Newbridge	1,449	8	0
Jenkins, J., Newport	1,449	0	0
Hatherly and Carr, Bristol	1,435	0	0
Perkins, Parsons, and Co., Cardiff	1,396	0	0
Williams, E., Newbridge (accepted)	1,379	17	0

Bratton Clovelly, Devon.—For repairing works of water supply at Bratton Clovelly, for the rural sanitary authority of Okehampton:—

Abell, Israel, Hatherleigh (accepted)	£56	10	0

Bromley, Kent.—For alterations to coachhouse at Springhill, for Mr. W. Bowley. Mr. Percy B. Strudwick, Bromley, Kent, architect:—

Podger, J. (accepted)	£42	0	0

Bury, Lancs.—For paving, flagging, and curbing certain streets, for the town council:—

Woodhead and Greenhalgh (accepted).

Bury, Lancs.—For the supply of 3,000 tons of 4in. iron pipes and 3,000 tons of 6in. iron pipes, for the waterworks committee of the town council:—

Stanton Iron Co. (accepted).

Cardiff.—For the erection of new church in St. Andrew's parish, for the Rev. G. W. Handford and Building Committee. Mr. Geo. E. Halliday, Cardiff, architect. Quantities by Mr. John W. Rodger, Cardiff:—

Hatherley and Carr, Bristol	£8,769	0	0
Knox and Wells	8,654	0	0
Davies, D.	8,560	0	0
Rees and Thomas	8,050	4	6
Latty and Co.	7,500	0	0
Cadwallader and Hockridge	7,220	0	0
Evans Bros.	6,962	9	10
Stepson, S., and Son (accepted)	6,936	17	3
Fryatt, Richards, and Co.	6,811	13	4
Haines, J.	6,498	0	0

Rest of Cardiff.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXVII.—No. 2085.

FRIDAY, DECEMBER 21, 1894.

THE LONDON BUILDING ACT, 1894.

By Professor T. Roger Smith.

A MEMORANDUM of the principal changes made in the rules, and of the new enactments introduced, under the above Act, so far as the same are likely to affect the erection of dwelling-houses of moderate size in a suburban district.

N.B.—This memorandum is not exhaustive. It does not refer to all the parts of the Act, and does not profess to include any of the rules in the old Acts and by-laws which are re-enacted. What is given is only what is new, and of that only what is most likely to be wanted, and this has been, generally speaking, stated in as condensed a form as possible, not in the words of the Act.

The London Building Act, 1894, takes effect from January 1, 1895; but buildings commenced before that date and then in progress may be carried out in conformity to the old Acts, as may works executed under any contract entered into before 25 August, 1894 (the date of the passing of the new Act).

WALLS OF DWELLING-HOUSES.

Schedule 1 (7).—For the purpose of determining their thickness, the height of walls shall be measured from the base of wall to the top of the topmost story, whether such wall is carried to the full height or not. In the case of a gable where there are no rooms in the roof, to half the height of the gable.

Schedule 1, Part 1.—A wall one brick thick may under no circumstances inclose more than two stories.

(1) A wall up to 25ft. high and up to 30ft. long, and comprising one or two stories, may be one brick thick. If there are three stories, or the wall is more than 30ft. long, a wall of this height must be one brick thick on top story and one and a half brick below such story.

(2 and 3) Walls between 25ft. and 40ft. high and under 35ft. long must be one and a half brick thick below the top story, and one brick for the remainder. If longer than 35ft., a wall of this height must be two bricks for the lowest story, then one and a half up to topmost story, and one brick the remainder. The same thicknesses apply to a wall between 40ft. and 50ft. high, but under 30ft. long. A wall of this height between 30ft. and 45ft. long must be two bricks thick for two stories, and one and a half the remainder. If longer than 45ft. the lowest story must be two and a half bricks thick. For greater heights and lengths consult the Act.

Schedule 1 (9).—Footings.—The height of the footings must equal $\frac{2}{3}$ of the thickness of the wall at the base. So provide for a 1-brick wall, two courses; for a $1\frac{1}{2}$-brick, three courses (four if bricks are small); for a 2-brick wall, four courses (five if the bricks small). To have regular offsets. When an adjoining wall interferes the footings may be omitted.

Schedule 1 (10).—Underpinning is to be in cement to full thickness of old work, and with proper footings, or to an increased thickness, if required on solid foundations. The whole shall be executed to the satisfaction of the district surveyor.

Schedule 1 (11).—Thicknessing may only be done after notice has been served on district surveyor of the intention to thicken; must be in cement properly bonded to the old to the satisfaction of the district surveyor.

Schedule 1 (2).—Corbelling-Out is permitted to the extent of 6in., well and solidly done, and the inner face of the wall opposite the corbelling is to be carried up flush.

Schedule 1 (3).—Hollow Walls, if constructed, must have, on one side of the hollow space, a wall of the full thickness prescribed by the Act.

Sec. 54 (1).—Recesses and Openings in External Walls.—The area of these *above the ground story*, taken together, is not to exceed one-half of the whole area of the wall itself, above the ground story.

Sec. 54 (2).—Recesses in Party-Walls must have an arch in two rings of brickwork to full depth of recess turned on every story, except in the case of recesses for lifts; but if recess is not deeper than 5in., corbelling may be substituted. Recesses must not come within $13\frac{1}{2}$in. of external walls. The superintending architect, if applied to in accordance with rules to be hereafter made by the County Council, will have power to consent to a modification of the rule as to recesses and openings in special cases.

Sec. 73 (1).—Projections which are to be of fireproof material include outside landings, outside stairs, outside steps. Excepted are the eaves, barge-boards, and cornices to detached and semi-detached dwelling-houses (without the restriction as to their position which was in the previous Acts), and to other dwelling-houses in which the party-walls are corbelled out so as to project 4in. beyond such eaves, barge-boards, or cornices. N.B.—The County Council can vary this provision.

Sec. 73 (2).—Every Balcony, cornice, or projection shall be tailed into the wall of the building, and weighted or tied down to the satisfaction of the district surveyor.

Sec. 73 (5).—Bay Windows may not encroach on the public way, but in a 40ft. street, or if the front wall of building be not less than 40ft. from opposite boundary of street, bay windows to dwelling-houses, on the owner's land, 3ft. from ground line of front, but not so as to come within prescribed distance of centre of roadway. They must not be brought nearer to centre of party-wall than the amount of their projection. They may be three stories in height, but must not occupy more than three-fifths of the frontage, must not encroach on public way, or occupy land agreed to be given up to public, and must not be used for trade purposes.

Sec. 73 (6).—Projecting Oriel Windows or Turrets in a 40ft. road may be corbelled-out from a front wall. They may not project more than 3ft., nor more than 12in. over public way; no part of them is to be within 10ft. of the pavement, and no part of any such projection where it overhangs the public way may be within a distance of 4ft. of the centre of nearest party-wall. On no floor shall the width of such projections taken together exceed three-fifths of the frontage at the level of that floor. The whole is to be constructed to the satisfaction of the district surveyor, with an appeal to the superintending architect.

For bay windows, oriels, or turrets to which above rules do not apply the sanction of County Council (in consultation with the Local Board) must be obtained.

PARTY-WALLS.

Sec. 87.—A party-wall can only be built at the line of junction of two properties by consent of the adjoining owner and after notice. If such consent is refused, the builder may serve a notice on adjoining owner, and after one month may erect an external wall up to the boundary line, and may put his footings and concrete on his neighbour's land; but he must make compensation for any damage occasioned thereby.

Where an external wall is built against another external wall the district surveyor may permit the footings on one side to be omitted.

BICYCLE HOUSES AND SOME GREENHOUSES EXEMPT.

Sec. 201.—Small buildings not exceeding 30ft. in area and 5ft. from ground to eaves or plate, standing at least 5ft. from any other building and the street, and with no stove or flue, or heating apparatus, are exempt from the Act. So are detached greenhouses and the woodwork, but not the brickwork of greenhouses attached to other buildings. Window-cases for plants not projecting more than 12in. over the public way are also exempt.

Sec. 84.—No Wooden Structure, except a hoarding inclosing vacant land, and not more than 12ft. high, may be set up in any place without the previous consent of the Council. A builder's wooden workshop is only exempt during the construction, alteration, or repair of a building. A duly licensed hoarding is exempt, so is a pile or stack or store of timber not being a structure fixed or fastened to the ground.

Sec. 55.—Timber in External Walls must still be set back 4in.; but door-frames, window-frames, and loophole-frames may now be flush with the face of any external wall. The Council has power to exempt oak, teak, or other wood by by-law or otherwise.

Sec. 56.—Bressummers, if of Metal, must have at each end a clear space left for expansion equal to $\frac{1}{4}$in. for every 10ft. The district surveyor has power, at his discretion, to require that every bressummer shall have such story-posts, iron columns, stanchions, or piers of brick or stone or corbels as may be sufficient to carry the superstructure. The end of a timber not permitted to bear on a party-wall may be carried on a corbel or templet of stone, iron, or vitrefied stoneware tailed into the wall $8\frac{1}{2}$in., or otherwise supported to the satisfaction of the district surveyor.

FIRE-RESISTING DIVISIONS IN MIXED PREMISES.

Sec. 74.—If part of any building more than 10 squares in area (say 21ft. by 50ft.) be used for trade or manufacture and part as a dwelling-house, the two parts shall be separated by walls and floors of fire-resisting materials, and all passages and stairs and approaches to the dwelling-house part shall be of such materials. The doorways necessary for communication may be constructed in the walls of such passages, stairs, and approaches; and openings fitted with fire-resisting doors may be formed in any of the walls.

Sec. 81.—Railway Arches.—The Act shall for the future apply to any building constructed or adapted to be used for human habitation, built under, over, or by inclosure of a railway arch, or abutting thereon.

ROOFS.

Schedule 1 (1). — Sheds. — Open sheds under 16ft. high and under four squares (400ft.) in area may be built of substances and in manner approved by the district surveyor. For sheds of greater height or extent, it is still necessary to obtain the consent of the County Council.

Sec. 61.—The Roof of a dwelling-house must not be steeper than 75°, with the exception of tower, turret, or spires, and there may not be more than two stories in the roof. If the floor of any story in the roof of a domestic building is over 60ft. from the street-level, such story shall be constructed of fire-resisting material throughout.

Sec. 64 (1).—Fireplaces and Chimneys may now be corbelled-out at the level of any floor. Chimneys may be carried on iron girders having a direct bearing on walls to the satisfaction of the district surveyor.

Sec. 64.—(4) A flue must not be adapted to, or used for, a new oven, furnace, cockle, steam-boiler, or close fire for any trade or business, or for the range or cooking apparatus of any hotel, tavern, or eating-house, unless it be inclosed with brickwork one brick thick from the floor level up to the ceiling of the room above that in which the fire is placed.

Sec. 64 (5).—No flue shorter than 20ft. may be used for a steam-boiler or hot-air engine.

Sec. 64 (6).—Every flue must be rendered outside when passing through any floor or roof, or behind or against any woodwork.

Sec. 64 (7).—The position and course of every flue shall be distinguished outside the work as it is being carried up by outline marks in some durable manner, except where the wall is not likely to be built against.

Sec. 64 (17).—A hearth, and the incombustible substance on which it is bedded, shall be solid for a thickness of 6in. beneath the upper surface of the slab.

Sec. 64 (18).—A flue shall not be built in or against any party structure, unless it be surrounded with new brickwork at least 4in. in thickness.

Sec. 64 (13).—The six top courses of every chimney are to be built in cement.

Sec. 64 (21).—Timber shall not be placed inside any chimney opening within 10in. of the top of the hearth.

Sec. 66 (1).—The floor under every oven, copper, steam-boiler, or stove which is not heated by gas, and round the same for 18in., must be of incombustible and non-conducting materials, not less than 6in. thick.

Sec. 67.—The floor over any room or inclosed space in which a furnace is fixed, and any floor within 18in. of the crown of an oven, shall be constructed of fire-resisting materials.

Sec. 65.—Rules for the erection of furnace chimneys are given in the Act.

Sec. 47.—The Height of buildings is limited, and no building (with certain exceptions) may be erected or raised, without the consent of the Council, to a greater height than 80ft., exclusive of the two stories in the roof. More than two stories in the roof are forbidden.

Sec. 63.—Every new building exceeding 60ft. in height shall have such a fire escape from the part above that level as can reasonably be required. No such building shall be occupied till the County Council has certified that this is the case.

Sec. 61 (2).—Every building exceeding 30ft. in height, and used wholly or in part as a dwelling house or factory, and having a parapet, shall be provided with a dormer, window, or door, or a trap-door or other proper means of access to the roof.

Sec. 49.—No building (except a church or chapel) in a street laid out after August 7, 1862, and less than 50ft. in width, may be carried higher than the street is wide.

OPEN SPACE.

Sec. 40.—Air Space Behind Houses.—If there is a habitable basement, a space for light and air of no less than 100ft. super. in the rear, belonging exclusively to the house, free from any erection above adjoining pavement, must be provided.

Sec. 41 (1 and 2).—In the rear of every domestic building there must also be a space not less than 10ft. deep, as wide as the building, and of 150ft. superficial area at least. This space is to be free from any building, save a w.c. and ash-pit, and these must nowhere be more than 9ft. high; but the ground story of the main building, if it is not to be inhabited—e.g., if it be a back shop—may extend over this space as high as 16ft.

Sec. 41 (3).—The buildings must, at the back, be limited by an imaginary slope, starting from the back boundary, and allowing them to rise 2ft. for every foot they set back therefrom. If they stand in a street laid out before Jan. 1, 1895, that slope starts 16ft. above the pavement level in front, in other cases from that level. Such a house at 10ft. back may, therefore, rise 36ft., and at 20ft. back, 56ft. A house in a street to be laid out hereafter might only rise to 20ft. at 10ft. back, and to 40ft. at 20ft. back. Chimneys, dormers, &c., may extend past this line.

There are various provisions affecting the above rules, and directions how to apply them when the pavement is not level, or the site is not level, or the plan of the site is irregular, or there is open space at the rear dedicated to the public, or when the buildings occupy a corner site. The Council can dispense with these rules if satisfied that as much cubic space of air will be provided as there would have been if the rule had been conformed to.

Sec. 70.—No Habitable Room may be constructed, and no such room constructed after the commencement of this Act may be occupied unless it be of the clear height already stated, and ventilated by a window, dormer, or lantern of the size and description given in the Act. In the basement story the boarded floor of every such room shall be ventilated. Every habitable room constructed over a stable shall be separated therefrom by a floor having 3in. of concrete pugging and with a lath-and-plaster ceiling, or other solid construction. The approach to such rooms (staircase, passage, &c.) shall be separated from the stable by a 9in. brick wall.

Sec. 74.—Staircases.—In every tenement building the common staircase must be ventilated on every story above the ground by windows or skylights, and the principal staircase of every dwelling-house must be ventilated by a window or skylight.

Sec. 13 and Sec. 43.—A person wishing to alter or re-erect a building standing on the 1st January, 1895, or within seven years previously, may cause plans of the building to be verified by the district surveyor, and may then proceed to build, but so that no more land be occupied. If he desires to deviate from the old plans, he is to obtain the sanction of the Council.

Sec. 42.—There are special provisions in several parts of the Act affecting houses to be inhabited or adapted to be inhabited by persons of the working class, and tenement buildings in which such persons may be accommodated. If such buildings do not abut on a street the plans must be approved by the Council.

Sec. 118 and Sec. 119.—No building may be erected within 50ft. of any building used for a dangerous business, and no dwelling-house within 50ft. of any building used for a noxious business.

Sec. 20.—The Conversion of Buildings is the subject of rules which prohibit without the consent of the Council (1) the conversion into or use as a dwelling-house of a building not originally constructed for habitation; (2) converting two or more dwelling-houses into one; (3) turning one dwelling-house into two or more; (4) so altering an exempt building as to bring it within this portion of the Act had it been originally built in that form; (5) restoring to use as a habitation a building which has been discontinued as a dwelling-house or appropriated to another purpose; (6) converting a shop into a dwelling-room; (7) converting a dwelling-house into a shop, if any of the above is so done that the building when altered will not be in conformity with the provisions of this Act.

OFFICIAL v. PRIVATE PRACTICE.

WHETHER an official to a board should retain his professional practice or not is a debatable point among many. As a matter of experience it has been found that the public gain by the official giving his undivided attention to the duties of his office, and that the men selected for a public position are best taken from those whose inclinations and training have specially fitted them for official duties. The private practitioner is not invariably the right man; he is often a man of indecision or want of firmness, or he may have a very sensitive organisation which ill-qualifies him for a position in which equanimity is particularly necessary. An important requisite to a man holding a public appointment is that he be not too "thin-skinned." Officialism soon dulls the edge of a keen sensibility; it makes the representative of the law less punctilious about offending the individual, and in proportion to the extent of his official jurisdiction it makes him sometimes arbitrary and overbearing. Municipal surveyors and medical officers of health are called upon to discharge duties of the most varied and onerous kind, which demand qualities of firmness and capacity to administer with even-handed justice. These are not often to be found amongst professional men in private practice, and for certain obvious reasons. The private practitioner has to seek his clients, to comply with the instructions he receives, to uphold his client's interest in case of disagreement. His position is often one which requires tact and complacence in dealing with his client, whom he desires naturally to please. In many cases he has to, if possible, overcome the objections of the municipal surveyor or district surveyor, to try and evade the Act, and even to resist the strict compliance with certain sections or by-laws. The private practitioner has rather to assume the position of defendant in all those points of law which the local surveyor has to enforce. These are qualifications, or, rather, habits of mind that disqualify the private architect, however able he may be, from discharging the judicial functions of the public surveyor. The very qualifications which go to make a gentleman of education, courtesy, and good feeling are remote from those most necessary for a public official who has to control, or keep in check, builders and owners of all sorts, many of them not over-scrupulous or particular in their mode of warfare. The municipal or the district surveyor must be prepared to deal with daring and unscrupulous enemies of the law at times, and with all sorts of intrigues amongst members and partisans on his own committee.

A question of considerable importance to the profession in the Metropolis has arisen connected with the statutory appointment of district surveyors under the new Building Act. According to the by-laws and regulations which the London County Council have lately passed, Part XIII., it is made prohibitory for a district surveyor to practise as an architect. Of course there is a great deal to be said on both sides; but we are certainly disposed to think the weight of evidence is on the side of the "regulation" of the Council. The strongest argument that has been adduced by those who think that district surveyors should be permitted to be practising architects is that advanced by Mr. W. D. Caröe, and supported by many members of the Institute, that the practising architect who has dealt with problems of construction, and has supervised operations on his own account, is the most efficient man for the post. There cannot be any doubt that men who have been interested in their own work in difficult questions of construction are better able to form an impartial judgment of any such question that may arise under the Act. The administrator of the by-laws may be a fairly competent surveyor, of general knowledge and some experience, but not so skilful in constructive details as an architect. On the other hand, a great deal can be said for confining the district surveyor's attention to the duties of his office in seeing that the provisions of the Act are carried out. If he had a private practice as an architect he would be naturally restrained in action; he would scarcely like to insist upon rules which he himself had been neglectful of in his own work, and his time would be less at the service of his official duties. On many questions of disagreement he could not lay down the law or exercise a judgment with the same independence and freedom as he could if he were entirely acting on his responsibility as a surveyor of the London County Council. Another point, to our minds, that seems equally strong against the dual capacity is that independent practitioners would have less chance of engagement where district surveyors also practised on their own account. Owners and lessees of buildings would consider it to be their best policy to employ the district surveyor, under whose control all plans and buildings would have to come. They would say "he might as well be employed first as last," as the designs have to be submitted to him.

In the discussion of this question at the Institute, it appears to us that Mr. John Marsland, a member of the Building Act Committee, struck the key-note when he remarked that he had listened to no argument why the resolution should be taken off the books "except that it would be for the benefit of the Institute." No independent member or younger members had anything to say against the regulation, and he thought the Institute should support their recommendation with better argument. Again, Mr. E. T. Hall very rightly urged that the members of that body would do well to repudiate the notion that they looked after the appointments of district surveyors because they were valuable to the members. This is certainly a rather low view of a public duty for a professional body to take. Whatever their objections may be to independent district surveyors without private practice, it would have been in better taste not to have brought this point too prominently forward. Architects, in their corporate capacity, are responsible to the public for matters connected with the safety and construction of building in London, as upholders of the Act, and the only useful stipulation would be that a candidate for the office of district surveyor should have been in practice some years.

One of the chief reasons why a district surveyor ought to be independent of private practice is that he should devote his whole time to the duties of his office. We can bear out the statements made the other evening that in some districts the surveyor was never seen. If a dispute arose about a party-wall or projection, he would probably put in an appearance. Generally his clerk assumed the *rôle* of surveyor. By the new regulation in force this delegation of duty will be impossible. Every candidate will be required to sign a declaration that he accepts the appointment on the understanding "that he will personally discharge the duties of his office," subject to sec. 142 of the Act; "that he will give his whole time to the duties of his office," and that he will "not during his continuance of office carry on business as an architect, surveyor, or builder, &c., directly or indirectly as a partner, or otherwise be interested in such business," &c.

The absolute importance of such a rule has been proved by the experience of large municipalities. Whenever the corporation engineer or surveyor has been permitted to undertake private work, the tongue of slander has not been long quiet. Quite lately we have heard disquieting rumours about surveyor-"pluralists" who have undertaken work on their own account; and of others upon whom financial duties of the borough have been undesirably thrust, to the detriment of public interests and of their own peace of mind and reputation. Those who have had any experience of the duties of municipal surveyors know very well how often they are expected to undertake work quite outside their special function, in managing estates, collecting rents, paying wages, and other matters, which more particularly belong to the accountant's and treasurer's departments. Corporation economists are ever ready to put these duties on the surveyor, and the result is the appointment of assistants, or the overburdening of the surveyor with responsibilities which he ought not to be called upon to fulfil.

Whether an administrative capacity for carrying out the statute law for building and the by-laws of the Public Health Act in relation to various sanitary matters can be efficiently combined with architectural ability in the same individual, is a question which we may leave to our readers to judge for themselves. One thing appears certain, and that is that official municipal architecture has not been generally esteemed, and we cannot expect an official, "steeped up to his ears in details" of town work, to spend much thought or study on designs for public buildings, however valuable his ideas of official accommodation may be. Nor is it fair to the profession, who have local claims or otherwise, that buildings of importance, in an architectural sense, should be exclusively designed by salaried officers. We are ready to acknowledge instances where substantial and creditable structures for baths and washhouses, piers, markets, and even public libraries have been carried out by town surveyors; but we believe the consensus of opinion of these officials would be found generally to be in favour of leaving strictly architectural work to outsiders. Utilitarian buildings, like markets, abattoirs, and baths, are often intrusted to the borough surveyor, because he is probably better acquainted with the actual requirements than a stranger would be. In particular branches, indeed, such as these and artisans' and labourers' dwellings and public abattoirs, the borough surveyor has an advantage, as he is conversant with the Public Health Act and the powers of urban authorities under it, and under the Artisans' and Labourers' Dwelling Act. These are qualifications which often enable him to undertake works not so well understood by the private practitioner. His plans are everything that can be desired, though his elevations are faulty. It is here his weakness appears. He has to employ another to do the architectural drawings, or it is given to an assistant in his office. Architectural practice alone is sufficient to engage the attention of one man. When he is distracted with sanitary and surveying practice, valuations, arbitrations, the administration of by-laws, and other matters, it is impossible for him to direct his mind profitably to any work of an artistic kind. Upon these grounds the union of public duty with private interests appears to be undesirable, if not impossible.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The fortnightly meeting of this Institute was held on Monday evening, the President, Mr. F. C. Penrose, F.R.S., in the chair. The deaths were announced of Mr. W. G. Coward, of Sydney, Fellow, and of Mr. H. A. K. Gribble, of London, Associate, and on the motion of Woodward a vote of condolence was passed with Mrs. Gribble. The President announced that the Ashpitel Prize, given to the candidate who had most highly distinguished himself during the year in the obligatory examinations, had been awarded to William Edward Vernon Crompton, of Moot Hall Chambers, Wallgate, Wigan.

THE LONDON BUILDING ACT, 1894.

A paper on this subject, illustrated by diagrams, was read by Professor Banister Fletcher. The author remarked that, the definitions had ever been the stumbling block of Acts of Parliament, and it was curious that, although in the new London Building Act the definitions were much improved, there was among them no answer to the moot question, "What is a building?" The case of "Stevens v. Gourley," heard before magistrates, and on appeal before the late Chief Justice Erle and Justices Williams and Biles, showed the extreme difficulty of definition. Indeed, the lecturer believed that in the original draft of the Bill an attempt was made to define a "building," but this definition was struck out during its progress through Parliament. Why did not legal practitioners he would ask, face this difficulty of settling definitions, instead of shirking it, and thus leaving laymen to fight over mere expressions in Courts of law? As a proof that definitions could be made clear and not liable to be misunderstood, he quoted Definition 26 in Part I. of the Act, which was so worded as to include every building which could be erected except two—"public building," defined in No. 27, and "warehouse," defined in No. 28; definitions No. 37 and 38 again explained the expressions "inhabited" and "habitable." As regarded the centre of a roadway, the lecturer pointed out that, under the Act, the centre remained fixed, notwithstanding that the centre of the roadway might have become altered by reason of the roadway having been widened on one side only, or on both sides, to an unequal extent. This definition seemed to him of much value in preventing the active owner from loss of his proper advantage. Thus the owner on either side of a road 20ft. in width, if the widening were required for carriage traffic, would have to set back each 10ft., and therefore each owner, A and B, lost respectively 10ft. in the depth of his land. Now, let them assume that A desired to have a 50ft. road, and set back from the centre of the roadway 25ft. B, without this regulation, need only set back 5ft. instead of 10ft., and then to provide a road 40ft. in width gained 5ft. in the depth of his land, and hence by delay B gained an advantage, and prevented A from obtaining the advantage he desired. It was, therefore, absolutely essential that they should distinguish between the legal and geometrical centre of the road. The fixing of a gradient, under Section 9, sub-section 6, was a new and, he considered, an extremely good feature. He strongly objected to the powers the County Council had reserved to themselves to vary the rules; in fact, the Bill, as originally drafted, bristled with permissions to evade every clause of it, and although it had to some extent been modified in this respect, he would strongly recommend the Council to get rid of this permissive power as far as possible by formulating fixed rules and regulations, so that one set of rules would apply to all cases. It seemed to him that subsection 4 of Section 9 would prevent the formation in the future of circular and crescent roadways having each end communicating with the same streets. There had been much litigation on this point; but the words used in the present Act, "laying out the same to afford direct communication between two streets," would probably prevent any question arising in the future. Under Section 56 of the new Act, the district surveyor had more power with respect to bresummers, and, so far as he was aware, it was the first Building Act setting out any allowance for expansion of metal. The mention in this section of a "bearing of 4in. in length at each end" was important, because, in dealing with long wooden beams, if the builder insisted on his right of only giving 4in., the district surveyor could, if he thought the bearing insufficient, require additional story-posts or iron columns to be provided. The new restriction as to projection of cornices to only 2ft. 6in. over the public way would seriously interfere with the treatment of Classic and Renaissance architecture, and the only way to obtain a greater projection would be to set back the front walls, or to obtain the permission of the County Council. It would be noticed that a slight alteration was permitted in the area as to the cubic contents of warehouse buildings, which had been extended from 216,000 to 250,000c.ft. In Clause 76 power was given to the Council, acting under the advice of the superintending architect and the chief officer of the Fire Brigade, to consent to each building containing additional cubical contents; but such consent would only continue in force while the said building was actually used for the purposes of the trade or manufacture in respect of which the consent was granted. More latitude in the use of combustible materials was permitted by the relaxation of the provisions in the expiring Act, and under the new Act cornices and bargeboards of wood were permitted. One of the new requirements was that buildings exceeding 30ft. high, used as dwellings or factories, and having a parapet, were to be provided with a dormer window or door opening on to roof, and a trapdoor with proper step-ladder, or other proper means of access to the roof. It seemed that this requirement could only be enforced where there was a parapet. The new Act limited the number of stories in the roof to two, and where a story was above 60ft. from the street level, the upper surface of the floor had to be not of wood, but of fire-resisting materials. While the old rule as to the angle of inclination for warehouse roofs was continued, a novel feature in the Act was the fixing of an angle of inclination for the roofs of other buildings, which must not incline upwards at a greater angle than 75°; this limitation did not, however, apply to towers, spires, or turrets. The Act recognised for the first time a separation of buildings by other than party-walls. It permitted the separation by a "party structure," and this might be a party-wall or a partition, floor, or other structure separating buildings vertically or horizontally. The rules with regard to separate sets of chambers in one building were made more stringent by making the area commence at 2,500sq.ft. instead of 3,500sq.ft., and the uses to which such buildings might be put were very limited. The provisions as to chimneys and flues were practically the same as in the expiring Act; an important alteration prevented the use of ordinary flues for trade purposes. The provision for marking the position of flues on walls that were likely to be built against was a useful one; but, personally, he had never experienced any difficulty in getting this done. Section 64, sub-section 6, provided that all flues were to be rendered on the outside face when passing through a floor or roof; this would involve some additional expense. The new Act had no provision as to the thickness of the backs of chimney openings in walls other than party-walls, such as was made in Section 20, sub-section 7, of the expiring Act. There was a slight reduction in the thickness of hearths, from 7in. to 6in. An important new feature in the Act is the requirement that the top half-dozen courses of a chimney-stack or shaft should be built in cement. This would be most useful in maintaining the stability of the chimney-stack, and also that of the tallboys, wind-guards, and cowls, too frequently added. The thickness and tapering of shafts was fixed in the new Act, which also limited the height of a shaft by its width or circumference at the base. Indeed, many existing shafts, if condemned, could not be rebuilt to their present height without increasing the width at the base. The provision as to "hollow walls" was likely to prevent them from being built, because the wall on one side of the hollow space was required to be of the full thickness prescribed, plus the hollow space, plus the outer casing. The enactment that no recess should come within 13½in. instead of 12in. of the outer surface, as in the expiring Act, was wise, as it made a brick measurement of the requirement. A valuable alteration under the new Act was that no limitation seemed to be set on the quantity of openings and recesses on the ground story. This was an important concession, and removed a great difficulty as to shop premises; and although some critics had contended that this clause might read that there should be no openings or recesses on the ground story, the common-sense reading would assuredly be adopted by the Courts. Instead of merely saying, as the old Act did, that recesses were to be "arched over," the new Act set out the structural method of arching recesses more than 5in. in depth, and a novel feature of the Act was that recesses under 5in. in depth might be corbelled out in brickwork or stonework. Hoardings were exempted from the Act where they were placed around vacant land, provided that they did not exceed 12ft. in height. A relaxation of the strict rule as to open sheds would be found to be of much advantage to small traders. The Act demanded an increased height in all dwelling rooms, which, instead of 7ft., must now be 8ft. 6in., while for rooms in roofs the height must now be 8ft. instead of 7ft., an increase of 18in. in the one case and of 12in. in the other. He thought the silence of the Act as to the size of lantern lights was a wise one. The requirement for ventilation was sufficient; it was that the open should be equal to one-twentieth part of the floor space. Under Section 70, the restrictions as to underground rooms were continued, and although the penalty for non-compliance was not stated in sub-section 2 of that section, its amount was duly given in Section 200, sub-section 11. Then Section 70 in the Act required ventilation under the lowest floor, unless it were a solid wood floor on concrete. Novel, and as he thought scarcely necessary, provisions were made as to the sizes of windows in rooms; but the regulations of the sizes of windows in the the roof were, he thought very desirable, for too often such windows were placed too near the floor solely to suit the elevation. The lecturer, by means of a series of elaborate diagrams, showed the requirements of the Act as to the thicknesses of walls; the walls were now defined for every class of building, and were simplified. Speaking broadly, domestic walls had been a little increased in thickness, while those of the warehouse class were reduced; but there were many exceptions to these generalisations. A novel feature provided that where the length was 45ft. or greater, the increased thickness might be distributed in piers. An extremely important alteration was that to the yard space, the novel feature being the introduction of the diagonal line, limiting the height of buildings according to the depth of the back yard. In the original Bill it was proposed to have an angle of 45°, which would have reduced the heights of buildings to a much greater extent than the angle finally adopted, which was 63½°. The lecturer exhibited a diagram showing the operation of the rule with a back yard of the smallest depth permitted by the Act, and showed that it must injure a building internally, for it would be impossible to get square rooms while building up to a diagonal line. In conclusion, he said it would be very advantageous to learn whether, to exempt a structure from the operations of the new Act, a builder must have the footings actually put in, or was it sufficient that the contract should be signed? And, further, what was the position of a lessee who, under an old agreement, was under covenant to erect a certain number of houses to a given plan on an estate year by year?

Professor T. Roger Smith, in opening the discussion, said there were a great number of other variations between the expiring and the new Building Acts besides those touched upon by Mr. Banister Fletcher. Speaking generally, there was not a large amount of radical change in building legislation; but there were very many variations and adjustments, and a great number of special cases were provided for. This would no doubt prove troublesome in some cases, especially at first; but a good many difficulties had been cleared away by the new Act. One instance of the improvement was the removal of all restriction as to the proportions of openings in the front wall on the ground story, which would be of great advantage in designing shopfronts. The old rules as to voids and spaces were structurally unnecessary now that the manufacture of steel girders had been so much improved. The law had been amended in permitting walls to rest on iron girders; it was true this had constantly been done of late, but the doubts as to the legality of the system were now removed. There were at least a dozen similar points on which the law recognised the changes in constructional systems, and was rendered more clear in its requirements. The law had also been relaxed with regard to oriel windows, bargeboards, and other picturesque features. Personally, he was sorry to note another relaxation — that which permitted windows and doors to be brought out flush with the wall surfaces without a reveal. He did not imagine these relaxations would affect house architecture much for the next twenty or thirty years. When the duty was taken off bricks, it was expected that they would be made of all sizes; but they all knew that the vast majority of bricks were still made of the stock dimensions. Professor Banister Fletcher had made no reference to the Tribunal of Appeal. The decisions of such a court should be systematic and based on a certain course of procedure. He wished to bear testimony as to the great attention given by the Building Acts Committee of the County Council to suggestions by district surveyors and architects for the improvement of the draft Bill, and the many modifications introduced had greatly improved it. He wished the Act had been a smaller one.

Mr. H. H. Collins observed that the major portion of the lecture was to be found in the introduction to Mr. Banister Fletcher's new book on the Building Act. The Act had been greatly improved by the changes made at the suggestion of the District Surveyors' Association, and the members of that body would loyally carry out its provisions. He agreed with the lecturer in regretting that the 63½° rule had been adopted, as it would be productive of bad construction, for back walls would be constructed of slates and tiles, instead of honest brickwork. He should like to ask Dr. Longstaff what provision had been made for communication through horizontal party structures. There was no mention in the new Act of the sizes of flues, which might now be 2in. in diameter, or any other size a builder preferred. Hollow walls were, as Mr. Fletcher had said, practically prohibited within the Metropolis. He should like to know what was the meaning attached to "habitable rooms" in a basement. Did it include a kitchen, scullery, or pantry? Again, in the clauses relating to dwellings for the "working classes," the latter term was not defined. Perhaps Mr. Longstaff could tell him if he might include his own house in the category? Mr. Collins concluded by exhibiting some diagrams he had prepared, from which he sought to show that under the new Act the width of a court being reckoned from window to window, it could be made a mere narrow slit of any length possible, and thus would become a long reservoir of stagnant air.

Mr. John Slater thought that on the whole the London County Council were to be congratulated on amendments made to the crude suggestions of the original draft Bill. He disagreed with Mr. Fletcher as to the ill effects of the powers retained by the Council to vary or relax the requirements in exceptional cases. To him the permissive clauses seemed the salvation of the Act in dealing with an ancient city like the Metropolis, for in many cases insistence on the letter of the law did inflict considerable hardship on building owners. He trusted the Council did not intend to prohibit the formation of open crescents under section 9. He should have preferred that the Tribunal of Appeal should have consisted of one barrister and one architect, rather than of three architects and surveyors.

Dr. Longstaff, Chairman of the Building Act Committee, L.C.C., said strong objections had been made to granting the Council permissive powers to vary or relax their rules; but he, for one, should decline to frame a single building regulation unless powers to waive it in exceptional cases were granted. At the same time, he hoped and believed the clauses would, as a rule, be enforced, for every permission involved delays and the possibility of injustice. As to the angle of 63½° at the rear of premises, he regarded it as a very liberal allowance to building owners. There were several ambiguities in the Act, each the result of alterations made while passing through Parliament, and in particular there were two very difficult questions of interpretation of which the Building Act Committee knew, which no critic had yet discovered, and which he certainly was not going to reveal. Mr. Collins had complained that the term "working classes" was not defined, and had suggested that he might come within its range. That was impossible, for the most modern definition of the working-classes was "persons who never work more than eight hours a day." It had also been said that men might be divided into two classes—men who work, and working-men. The commencement of a building could not be reckoned from the date of the signing of the contract, nor even from the making of excavations, but from the placing of materials in position. A building agreement would not be construed by the Council for the purposes of the new Act, as a building contract. As to habitable rooms, Mr. Collins seemed to regard a wine-cellar as coming under that definition, but neither that nor a pantry or scullery would be included. If a building were separated horizontally by a party structure, say, by iron and concrete floors, if Mr. Collins formed openings in those floors it would cease to be a party structure. They had thought it unnecessary to define the dimensions of flues, as architects might have their own ideas on the point. As to the width of areas, it was true that under the new Act they might be made very narrow; but he did not believe this would be acted upon. If an area were constructed for light and air, it would let in more of each if 300ft. long than if carried only 10ft. The rule that Mr. Slater fancied would permit the formation of crescents was intended to give powers to prohibit the formation of a street behind a square block having only an outlet at either end into the main thoroughfare, and was merely a permissive clause.

Mr. C. Stanley Peach suggested that a classified list of decisions of the Tribunal of Appeal ought to be kept for reference by architects and building owners. The question of the centre of streets promised to be a difficult one, and he had a case coming on of a street formed between July, 1878, and August, 1890—dates referred to in the Act—in which the centre had never been defined.

Mr. C. Fowler, in proposing a vote of thanks to the lecturer, expressed his disapproval of the rule as to an angle of 63½° at the rear of buildings as inimical to good building.

This was seconded by Mr. Thomas Blashill, superintending architect L.C.C., who asked what better definition than an angle of 63° could be suggested? It was easy to give a sound rear wall under it by keeping the building well within its boundary at the back. One great reason for the regulation requiring a 4½in. reveal to all windows (now abolished) was that, in case of fire, the glass was less liable to fall out on the heads of passers-by, and special means would have to be taken by architects building their windows flush to prevent such accidents.

Professor Banister Fletcher, in acknowledging the vote of thanks, said that he quite agreed with the omission of the sizes for flues. Many architects regarded a circular flue 6in. in diameter as preferable to the old 9in. by 14in. flue. They had been divided in opinion on the diagonal line at the rear of buildings; but he could assure Dr. Longstaff that all the district surveyors acted on the square, and would loyally carry out the provisions of the new Act, so as to make it work well and thoroughly.

A SPECIFICATION ANNOTATED.—V.

21. *Removal of Rubbish.*—The buildings and site must be kept clear of rubbish and waste material. On completion of the works, these must be given up in proper order; the floors of the building washed and the windows cleaned, and the site levelled or sloped as shown on the plan.

Some builders and their foremen conduct their building work in a very slovenly manner. Not only is the site covered with all kinds of rubbish and materials, but every apartment of the building is also converted into a lumber store. Brickbats, stone rubbish, old mortar, and cement which has set should be carted away from the premises as these are produced during the progress of the works, or they will without doubt be used where they should not be. In an important building in the north of London a heap of soil and a quantity of turf, stripped off the area of some foundation trenches, were allowed to lie along the trenches until the concrete was filled in. The work commenced one morning early by burying all the turf in the trenches before the concrete was thrown in. If all this spoil or waste had been carted away, this irregularity could not have occurred. In another case, in a southern county, the floors of the outbuildings were specified to be of broken bricks laid 6in. thick. Tons of broken bricks were delivered on the site long before the floors were laid, and, it was noticed, these disappeared gradually, owing to a liberal use of them in the brick walling! All material not in strict accordance with the specification should be declared a nuisance, and its immediate removal from the site insisted upon.

22. *Scaffolding, Shedding.*—Safe and sufficient scaffolding is to be provided throughout, and the scaffold floors are to be raised at intervals of not more than 3ft. 6in. high to prevent building "overhand." Putlog holes are to be filled at once when the putlogs are removed. Temporary sheds, for lime and other materials liable to be damaged by wet, are to be erected on convenient spots, and "horses" to take flooring-boards are to be placed where the boards will have a full exposure to currents of air.

Some contractors have such a scant supply of scaffolding, that to get round the building the architect must balance himself on a single 9in. plank. Others, if they have a sufficient supply, take care to remove it from any place where the work is likely to attract attention owing to some defect. Others, again, are not able to carry up the work in stages all round the building, but must raise it in blocks, owing to a deficiency of poles and planks. This is prejudicial to good building, and therefore a good supply of sound poles, putlogs, cords, and planks should be insisted on. Bracing and staging ranges of scaffolding should also be insisted on—that is, poles should be tied diagonally across the uprights and ledgers in sufficient numbers and in such position as will stiffen the whole, and, what is most important, prevent it from *leaning* in any way against the fresh work, whether of brick or stone. Some really first-class ranges of scaffolding may be seen to many of the buildings in course of erection in London, done by special workmen, who do no other work. Indeed, the scaffolding to some of these buildings appears to be the only really first-class work about them. The erection and maintenance of water-tight shedding is a matter of the first importance. Cement and lime, delivered in casks or bags, should be placed under cover at once in a proper shed. It is painful to see these stored under such extemporised covers as loose corrugated sheets, sacks, or old tarpaulins. All sheds of this kind should have roofs constructed with a slope sufficient to discharge water from melting snow and heavy rains. A few years ago a firm of contractors in the north of London stored some tons of cement in sacks under a shed with a roof nearly horizontal. The snow lodged on the roof, weighing it down to a hollow in the centre, and the water from the thawing snow, of course, saturated the cement, setting it all solid in the bags. The contractors were equal to the emergency, for they ground up the cement, bags and all, to make mortar!

23. *Care of the Building.*—The care of the buildings is to rest with the contractor, who must be responsible for, and make good all damage done to, them until possession is taken by the building owner.

This clause is a more important one when the contract works are for additions to an existing building, or a restoration, than when the building is entirely new; but in all contracts, whether for new work or alterations to old, the builder should be held responsible for the due care and maintenance of the buildings. Some architects insert a clause in their "conditions of contract" that the builder shall insure the new work in the owner's name in an approved office, and for sums increasing in amount as the buildings are raised. Receipts for the insurance premiums should be presented to the architect, and endorsed by him, before any certificate for payment is made on account of the works. In altering an old building already insured, it must be borne in mind that an increased premium must be paid while workmen are on the premises. Before any such works are commenced the office should be advised of the fact, and the increased premium paid, or considerable loss may be incurred in case of fire. Several important questions may arise out of the application of Clause 23, in the course of a very ordinary experience, chiefly as to the extent of a contractor's liability under such a clause. Let it be supposed that in the execution of some new work to an already existing building, that building is found to be in a more dangerous condition than was anticipated when the contract was signed; can the contractor be held responsible for the safety of that building when he cannot carry out his contract work without endangering it? Or, to convert an abstract possibility into a concrete actuality, take this case: In a certain church restoration it was provided that the uppermost story—the bell-stage, in fact—of the western tower was to be taken down and rebuilt, and a large archway opened between the tower and nave. Provision was made for this work, and the conditions of contract contained Clause 23. Now an inspection of this tower after the contract was signed showed (1) that the bell-stage was of wrought stone, very substantially built, the quoins and dressings tailed from 3ft. to 4ft. along the wall face, the alternate stems of the window panels bending through the full thickness of the walls. The whole stage, in fact, though of debased "Perpendicular" work, was as well built as it was possible to build it, but was still sadly out of perpendicular, and rent in several places on the four sides from top to bottom. The lower stages of the tower were stuccoed outside and plastered inside. The walls, over 3ft. 6in. thick, appeared to be sound. There was clearly nothing whatever in the construction of the bell-stage to account for its ruined condition, so the contractor set to work to clear off the stucco and plastering from the lower stages, feeling quite certain that the cause of the failure would be found here. Now, no work of this kind was provided for in the specification. It was taken altogether for granted the lower stages of tower were sound, but the contractor, feeling satisfied something must be wrong with the bottom, proceeded to examine it before he dealt with the top. The removal of the stucco and plastering showed (2) that the lower stages were built with rubble boulder stones having no bond of any kind whatever; (3) that there were several fissures in the walls, all of which had been filled with mortar, and were concealed by the subsequent stuccoing; (4) that these fissures were caused by the walls bursting asunder from the strain on them of the heavy bell-stage, and were not due to foundation failure; (5) that the two detached angles of the tower were supported by angle buttresses, and as these had wrought-stone dressings, and could not, therefore, settle down like the rubble-work, they burst away from the main structure, in some places far enough to thrust one's arm between the buttress and the walls it was meant to support! And this was the structure on which it was provided the wrought-stone bell-stage should be rebuilt. On the condition of the lower part of the tower being pointed out to the rector, he at once decided that it would be sheer madness to build anything on it, and appeals were at once issued for subscriptions to remove and rebuild the entire tower on account of its "dangerous" condition. The architect had little to do with this new departure—he was for ignoring the condition of the tower, and carrying out the contract. In knocking holes through the east wall of the tower, where it rested in part on the nave wall, to take needles for shoring, bucketfuls of perfectly dry mortar in the shape of dust poured out of the walls for hours at a time. In fact, so dangerous did the whole operation become, that the contractor took personal charge of the work, and on several occasions for days he had to order all hands out of the building, fully expecting to see the whole structure collapse. It may be asked here, Why, before this work was attempted, the bell-stage was not removed? Because the amount provided for that work had been deducted from the contract sum as its absurdity was recognised, and the contractor was now carrying out the only provision made for the tower—viz., the insertion of the arch. After incurring much personal risk, a large archway was cut through this old tower, and the jambs and arch were lined with wrought stone. The success of this operation invited attempts at other improvements in the tower. Two small windows were enlarged and a doorway widened, when one morning, the entire tower settled down quietly on the ground, bells, roof, and weathercock, all occupying positions vertically under those occupied by them before the settlement. The walls fell neither north nor south, east nor west—they simply burst out all round, as a plum pudding would if a weight was placed on it. And now the trouble commenced. Who was responsible for the collapse? Rather an important question, for responsibility carried with it a liability to rebuild the tower. The architect stoutly maintained that his general clause, "the contractor should be responsible for the buildings," clearly provided for rebuilding the tower at the contractor's expense, and he would listen to no compromise. The rector and the building committee, who had previously dealt with the contractor on their own responsibility in this tower business, now discovered that they had an architect, and must be guided by him. The contractor was naturally indignant. He said: "Here you have the failure of a building not put up by me, a wretched old construction of rubble masonry concealed by plaster, the condition of which your architect failed to discover before the contract was entered into. At my expense I cleared off the surface of the walls, and made clear to you the absurdity of carrying out an important work provided by your architect, and which must not only lead to the ruin of the lower portion of the building, but of necessity to the upper portion as well. You were so convinced of the correctness of my views, that you opened a subscription list for rebuilding the tower, on the grounds, as stated in your circular, that its present condition was 'most dangerous.' Yet, after risking the lives and limbs of myself and my men, you seek to make me responsible for a failure brought about by endeavouring to carry out your wishes." The errors here were first in the architect—failure to discover the condition of the tower; in the second place, when he was made aware of it, he should have recognised the fact, and provided accordingly; and, third, when the failure took place, he should have admitted it was almost inevitable, and have done what he could to bring about some amicable arrangement in the matter. The contractor was at fault in dealing with the tower at all when he discovered its condition, and that work must of necessity be done in maintaining it for which no provision was made in the contract. The sequel, unfortunately, proved that irregularities of this kind are a fertile source of annoyance to all concerned. Law proceedings were commenced, and friendship estranged, and though the contractor was paid a price for his work, yet both architect and client believed, or affected to believe, they were very badly treated, for they intrusted the rebuilding of the tower to someone else. Minor cases of damage to buildings arise when frost destroys pointing or cement work; but these are such trifling matters, contractors generally make them good without complaints. It is very doubtful, however, if they could be compelled to do so, unless the architect could show that materials not specified were used in the work. An amusing case, in further illustration of Clause 23, occurred to an engineer in the West of England. He was employed by a corporate body to construct some reservoirs for the water supply of a large city. A contract was entered into, and when the works were completed it was found that the main reservoir leaked badly. The corporation refused to pay the contractor, alleging, as a reason for this refusal, that a reservoir was of no use unless it held water, and as this one did not hold water, the contract could not be considered as completed. The contractor, however, insisted on being paid; he said he never contracted to build a watertight reservoir—that he only agreed to do so much digging, puddling, and brickwork—that he had fulfilled his contract to the letter, and did not care whether the reservoir held water or not. It is almost needless to add he was right, and he was paid the balance of the amount in full. To apply this principle more directly to building work, suppose it is found that, owing to a low pitch and insufficient lap of tile or slate, the rain drives through a roof and destroys the ceilings. Then if this work is done in accordance with the drawings and specification, the contractor is not responsible for its failure. He merely carried out his contract, and he did not determine what pitch of roof or bond of tile would be sufficient to make the whole watertight. In the building of a new church in one of the Midland Counties ground lias lime concrete, made with shingle from a local pit, was specified for the foundations. When the roof of the church was covered in, it was noticed that the arcade shafts were out of plumb, and were rapidly going over. The tower and spire leaned over 3in. or 4in. in a height of 50ft., and threatened to fall over altogether. On carefully examining the foundations it was found that the concrete had never set, and that it was as soft as the day it was thrown into the trenches, and this apparently because the shingle used was coated with clay. The walls and piers were instantly shored up, and brickwork in cement substituted for the concrete, which was altogether removed from the trenches. Here the client had to bear the expense of the work, as the contractor carried it out strictly in accordance with his specification.

COUNTY LUNATIC ASYLUMS.—VIII.

By George H. Bibby, F.R.I.B.A.

THE amusements of the patients are provided for in the recreation-hall, music and billiard-rooms, &c., within the building, and in the airing-courts and cricket grounds without. Their education is forwarded, when possible, in a room or rooms set apart as a school, but this occupation is suitable only for a comparatively small number of patients. These may be near to the sewing-rooms of the females, and the work-rooms of the males. The idea of the school is not to contend with the insane ideas of the patient, or to demonstrate by philosophy the impracticability of his projects; but to withdraw his attention from morbid ideas to matters which are of use and interest. It may, in some cases, be a useful means of awakening the mind, and of imparting the elements of mental culture to patients who were previously ignorant. Like all employment which excites the brain, it ought never to be permitted in acute stages, and never continued but for a comparatively short time; the subjects of instruction should be regulated according to age, sex, and previous education, and may consist of elementary instruction in music, drawing, history, and attractive subjects. It may be combined with recitation, and might sometimes with advantage be conducted on the principle of mutual instruction, the more educated patients being encouraged to assist those with less knowledge. Lectures, walks, games, tea-parties, balls, theatrical entertainments, &c., also serve to engross the attention, and amuse the patients.

In the workshops of an asylum the number of persons to be employed may be proportioned to those I have already given (*vide* page 495), or regulated according to any special requirements of the district from which the asylum patients are drawn. Work is decidedly advantageous for the quieter patients and during convalescence, where the desire for work is apparent. In some cases, all healthy thought and action is closely connected with their ordinary employments and callings in life, and the artisan can often only find in his occupation the best means of recovering his mental capacity. There should always be ample means for thorough access to all workshops by the supervising officials. The lighting, ventilation, warming, fittings, and other arrangements should all be of the highest quality, and ample lavatory, water-closet, and urinal arrangement must be provided in suitably-placed annexes, care being taken to provide separate sanitary offices in all arrangements, dividing quarrelsome patients from those who may be quiet and disposed to be orderly.

In all cases of insanity, whether recent or of long standing, next to diet, a judicious regulation of rest and activity is most necessary to be observed, fresh and open air, and, in the less acute cases, abundance of outdoor exercise on foot, and sometimes in a carriage. No asylum is complete which has not space sufficient to admit of prolonged outdoor exercise for all classes of its inmates, in gardens, airing-courts and fields, &c. In many chronic cases it has been found very beneficial to prescribe gymnastic exercises and cheerful games which necessitate exercise, where in the mild excitement of the game the patient may forget self and distressing thoughts. Sleep should be the result of work, of exercise in the open air, of fatigue. It is also promoted by baths and quiet; but narcotics should be avoided as far as practicable.

The airing-courts for patients should be laid out with good paths, flower-beds, lawns for tennis and croquet, and be planted with shrubs, ferns, and flowers, and in every airing-court should be placed a few water-closets and urinals, a shed for garden-tools, watering-cans, and garden hose, &c. A few garden seats and arbours also might be provided; but in all these matters it must be arranged that the patients may be well under observation at all times, and that there shall not be easy means for hiding.

The fences round the airing-courts may be constructed with iron railings erected upon a dwarf wall, the whole being about 12ft. in height. These are far better than brick walls, which, to be of utility, would not only have to be of considerable height, and therefore expensive, but have the further disadvantage of arresting the free circulation of the air about the grounds and buildings. To obviate this difficulty, a sunk or "ha-ha" fence is sometimes provided, which has a manifest advantage in one respect, inasmuch as the prospects of the surrounding country are left open and uninterrupted.

In former times the airing-courts were merely paved yards surrounded by high walls, and were frequently of very small area compared with the numbers of patients dealt with. This, I believe —at all events, as regards this country—is a thing of the past; but many airing-courts or gardens are far from being laid out so well as they might be, some being of rather small dimensions. For an asylum of 1,000 patients, the land required for airing-courts should be not less than 20 acres. Any trees planted near the fences must be cut from time to time, so that branches therefrom may not afford means of escape.

The paths in the airing-courts should be usually 7ft. or 8ft. in width, thoroughly well made, in suitable forms for throwing off rain, with a foundation of not less than 6in. of broken bricks or other suitable material. The airing-courts generally should be drained with agricultural drain-pipes, unless there be special reason for dealing with the area otherwise. The walks should be laid out in undulating forms, but not arranged to resemble a maze.

The garden-seats should be placed upon small patches of paving or asphalte, and may be of wood. In an airing-court used usually by 100 patients, there should be seating of this description for about 25 patients placed at the most desirable points—some under the shade of trees, others in places where good prospects may be obtained.

Some accommodation should be provided in the airing-courts for such of the elderly patients as may be infirm or weak. This might be in the form of ornamental arbours where shelter from the elements could be obtained by the patients generally when necessary. Aviaries and pens for birds and animals may be provided for with advantage in specially designed buildings or sheds, of more or less ornamental description. These things interest patients and attendants, and give common pleasure to many. These buildings might be so planned by the asylum architect as to also include a room for storage of the materials requsite for the various outdoor amusements and games.

In some instances the airing-court closets are placed against the wall or fence in the centre of the sunk "ha-ha," the approach thereto being by an incline or steps from the general level of the ground. An objection to this arrangement is entertained by some medical officers upon the ground that closets when so sunk are liable to form hiding-places for patients. One advantage of placing them below is that they would be less conspicuous, and they are certainly unsightly features for view from the asylum windows. These places should always be carefully searched by the attendant in charge when returning with the patients to the asylum buildings.

The airing-courts should always adjoin the wards of the class of patients for whom they are intended, and in most cases it is desirable that there should be some space between the fences, so that patients differently classified may not approach too close to one another, or communicate with each other from each side of open iron fences.

The general approach to the main asylum and airing-courts (from the public road) should be arranged so that there shall be at the entrance to the grounds a residence for the lodge-keeper, such as is shown in Fig. 17. For some asylums a lodge is provided much larger than here shown. The minimum accommodation should, however, include a parlour, kitchen, and the usual offices, with three or four bedrooms, according to circumstances, the windows of the living-rooms being placed in the usual position so as to command a view of the gates. There should also be a waiting-room, with a small office. This might be used on various occasions—for instance, during visiting days, where patients' friends would be detained to show their authority to visit, or their fitness to do so ascertained prior to their further admission on the asylum grounds; for these persons w.c. and urinal accommodation may be provided as shown. On the opposite side of the entrance may be a second residence for an asylum official, or a number of attendants' cottages, as indicated upon Fig. 17. At some asylums the distance from the outer entrance lodge to the main asylum buildings is considerable, and therefore the provision of a shelter for visitors and tradespeople is certainly most desirable should a waiting-room not be provided. The shelter might take the form of a verandah attached to the lodge. In the design for the lodge and entrance-gates, considerable scope is allowable for ornamental treatment, which, however, would be less permissible on other portions of asylum buildings intended chiefly for pauper patients, and which ought to be built with some regard for economy now that lunacy is alleged to be increasing in some districts (even beyond the ratio of the natural increase of population). Upon this subject the medical superintendent of a large district asylum says:—

> "The immediate cause of the continuous increase of the asylum population is, of course, the preponderance each year of the admissions over discharges and deaths combined. The conditions differ from those of ordinary hospitals, in which, if a patient does not recover, and fails to improve after a fair period of treatment, he is discharged as incurable. But in an asylum *all the incurable have to be kept on as permanent patients*, except a few which may be sent to workhouses; so that from the nature of things an asylum population must perforce go on increasing until the admissions are balanced by an equal number of discharges and deaths, a condition of things the occurrence of which is only a remote possibility at present. Were all the other hospitals for the sick conducted on the same principle (unavoidable in the case of asylums), they too would be rapidly overcrowded with occupants, and, like asylums, there would be an ever-recurring necessity of adding to their accommodation by *structural additions*. This peculiarity, connected with asylum economy, is one apt to be lost sight of, or, at least, not to receive the attention which it deserves."

Architects who have competed in reference to

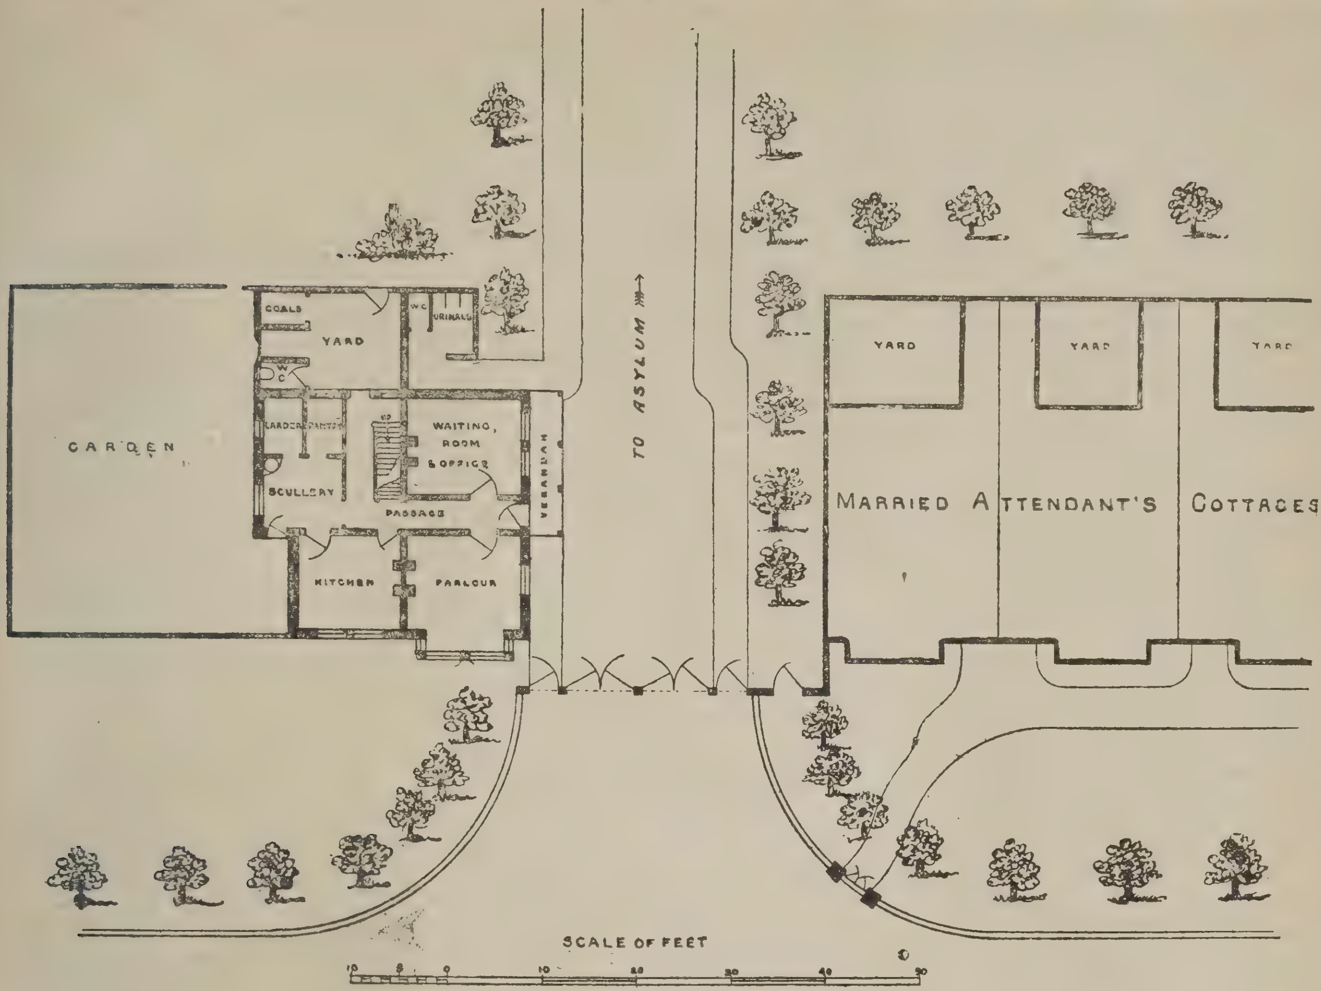

Fig. 17.

many recent schemes for asylums have been requested by the promoters of the competitions to arrange in their plans for future extensions, beyond first requirements. In several sets of plans for asylums I have noticed that the architects have considered it desirable to show in great detail the whole of the buildings (present and future) upon the plans, and there can be no doubt that this is an advisable procedure so far as the final efficiency of the buildings is concerned; but it is apt to be forgotten that for these plans for future extension the architect is not fully remunerated by the premiums or commission payable on the partly built asylum.

In arranging for future extensions, it is better to allow space for additional blocks of buildings rather than arrange for adding upper floors at a later date to the disturbance of the whole asylum, and it is certainly necessary to calculate the capacity of the required *administrative buildings* for the final number of patients to be accommodated after the full extension likely to be attained.

Perhaps one of the most difficult matters to adjust, however, is the *rearrangement* of the plans for the administration blocks of buildings for a very large asylum—one, for instance, like the one at Richmond, near Dublin, which has been enlarged again and again as regards the wards for patients, but without a corresponding enlargement of the laundries, kitchens, and other portions necessary for the officials and for administrative purposes. To rearrange the central buildings for a large asylum means frequently the temporary disturbance of the whole establishment and interference with the heating, ventilating, cooking, and laundry machinery for the whole place, also the rearrangement of the hot and cold-water supplies, and of the sewage and rain-water systems, while the patients must all the while be provided and cared for as usual. The duties of the resident asylum engineer are always most important, and the individual chosen must be thoroughly versed and experienced in all departments of engineering work. He must understand thoroughly the fitting and working of steam and hot-water boilers, machinery and appliances of all descriptions connected with cooking, heating, laundry work, and sanitary matters, and he should always be in charge of, and responsible for, the work of other artisans engaged upon the premises, who should work under his directions; he must always reside either in the asylum, or be provided with a suitable residence on the estate near to the scene of his labours; he should not only be able to keep the water supply in good order, but be competent to direct the operations of the asylum fire brigade, and see that its appliances are kept in repair and good order.

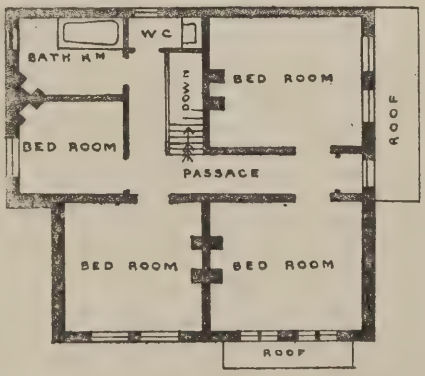

Fig. 18.

In some asylums he is expected, I believe, to make almost daily inspections of every part of the buildings, examining everything he can, keeping everything in good order structurally, seeing that the drains are flushed, the gutters cleaned, and all dilapidations are attended to.

Judging from the reports of those who have inspected some of the asylums in Ireland, it would appear that the buildings are too often allowed to fall into a great state of dilapidation. The attention of the authorities has been continually drawn to structural defects in the Irish asylums, and I believe that steps are now being taken in various institutions there to make good the deficiencies. The requirements of the Board of Control in Ireland are less stringent than in England—for instance, the day-rooms in Irish asylums need not contain more than 30 superficial feet per patient, whereas in this country the Commissioners in Lunacy insist upon a minimum of 40 square feet per patient, thereby increasing the cost per patient (for day-rooms) 25 per cent.

(*To be continued.*)

TALL BUILDING FOUNDATIONS IN NEW YORK.

THE tall office buildings of New York are growing apace. One of the latest is the American Surety Company's building in that city, which is a 20-story building resting upon columns, and constructed on the steel-frame system. The *Scientific American* gives a view of the building, and a detail of the steel foundations. The structure is 303ft. in height, and it covers about an area of 84ft. 4in. each way, though the sides are not parallel. The piers of different heights which carry the superstructure were sunk by the pneumatic method. On each pier a steel plate is placed. On this is placed a grillage. The first course is of ten 24in. I-beams, which just extend across the top of pier. Transversely to these are five 20in. I-beams, covering about one-half of the area, arranged in the centre. A course of steel billets, 4in. square each, rest on these beams, and on this the base of column is placed. To provide against pressure of a column coming too near the edge of pier, cantilevers are employed at the corners to shift the bearing of the outer column to the centre of pier. The end of each cantilever is held down by iron straps to the foot of masonry. For example, on the grillages a deep plate girder rests on two sets of steel billets. On the outer end which projects beyond the steel billets, the column of outer wall is placed, and on the inner end rests another column which supports a share of the weight and relieves the anchorage. Thus the ends of the plate girder, or cantilever, sustain these columns, the outer one resting on the overhanging end of the girder. There are 32 of these steel columns, two of which bear a weight of 584 tons each, and another is said to carry 1,280 tons, while the remainder carry smaller varying loads. Mr. Bruce Price is the architect. In another building, 150ft. high, a layer of concrete covers the whole area of building, and on this I-beams of 20in. depth are laid 12in. between centres imbedded in concrete. On this platform, longitudinal plate girders, 4ft. deep, are placed, on which the 26 columns carrying the superstructure rest. These carry loads varying from 172 to 357 tons. When the ground is of unequal bearing power, or soft, this kind of foundation is found to answer.

* * *

NOTES ON BUILDING PRICES.—LXVII.

By John Leaning.

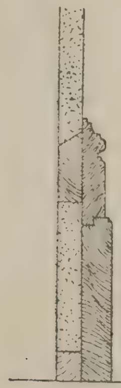
(*Continued from p.* 806.)

THE application of the foregoing constants may be illustrated by the analysis of a *few* ordinary items of joinery. An exhaustive selection from the enormous variety of joinery in modern use would unduly increase the bulk of these papers without an adequate advantage. It is, however, hoped that they will prove sufficient to explain the principles which should be observed.

Skirtings.—Large quantities of the ordinary kinds of skirtings are imported ready worked from Sweden, or are prepared in a considerable variety of stock patterns by the moulding mills. These are usually sold by the hundred feet lineal, and are subject to a discount of from 5 to 30 per cent. off list prices. The ordinary discount may be taken as an average of 15 per cent., including waste. If a cartload of skirtings or mouldings is purchased, it would be delivered free within ordinary limits. Smaller quantities must be fetched.

1in. by 9in. *torus skirting*, imported—

	s.	d.
1ft. of 1in. by 9in. torus at 22s. 6d. per hundred	0	2¾
Waste 15 per cent. equal to discount.		
Cleaning up	0	0¼
Fixing, ·013 at 7s. 11d.	0	1¼
Cost per foot run..	0	4¼



Skirting in two pieces, rebated together, the upper 1in. by 4½in., moulded 3in. girth; the lower 1¼in. by 7in., hollow moulded and rebated on lower edge. The upper piece would be wrought both sides, the lower, one side.

ft.	in.		s.	d.
1ft.	0in.	run of 1in. by 4½in. deal at 2⅛d. super.	0	0⅞
1	0	,, of 1¼in. by 7in. deal at 2⅝d. super.	0	1½
1	0	,, labour moulding, 3in. girth, at ·072ft. super. of 7s. 11d.	0	1¾
1	0	,, labour moulding, 1in. girth, at ·012 of 7s. 11d.	0	1⅛
1	4	super. planing, at ·010 of 7s. 11d.	0	1¼
1	0	run fixing at ·015 of 7s. 11d.	0	1½
1	0	,, rebated edge to 1¼in, ·003 of 7s. 11d.	0	0¼
1	0	,, rebated edge to 1in., ·003 of 7s. 11d.	0	0¼
1	0	,, fixing rough fillet on floor, ·005 of 7s. 11d.	0	0½
1	0	fillet, 1¼in. by 1in.	0	0⅜
		Cost per foot run..	0	9⅜

A few conclusions adopted by estimators which are near the truth and useful may be here given.

Mitres are generally estimated at some proportion of the value of a foot of the skirting, and this is probably the most convenient way of dealing with them. They are usually tongued as well as mitred. Estimators price them at from one-half to one and a half a foot of skirting. The price of *a foot* of skirting may be adopted as a reasonable average.

Fitted Ends.—The price of three-quarters of a foot run may be adopted as a reasonable average.

Housings.—The price of one foot of skirting may be adopted as a reasonable average.

Skirting, circular on plan, twice straight.
Ditto, ramped, twice straight.
Ditto, circular quick sweep, thrice straight.
Ditto, wreathed, five times straight.
Ditto, raking, one-half more than straight.

Floors.—	s.	d.
1¼in. yellow batten floor, at *Docks*	13	0
Landing rate, 1/27th of a standard, at 3s. 9d. per standard	0	1¾
Unloading, 1/27th ditto, at 2s. 6d. ditto	0	1
Cartage, say, 1/12th of a load at 5s. per load..	0	5
15 per cent. for waste in conversion and defects for the four foregoing items	2	0½
5½lb. of 2¾ floor brads, at 10s. 6d. cwt.	0	6¼
Labour, laying ·440 at 7s. 11d.	3	5¾
Cost per square	19	8¼

Casements.—The valuation of casements would be as follows:—Taking, as an example, a 2in. ovolo moulded casement 2ft. 6in. by 5ft. 6in. in a single square (13ft. 9in. superficial), hung with butts:—

ft. in.	ft. in.		s.	d.
2 6 0 4½	0 11	2in. deal. Bottom rail.		
13 6 0 2¼	2 6	2in. deal. Top rail and stiles.		
	3 5			
3 6		supl. of 2in. deal at 4⅛d.	1	2½
13 9		,, labour at ·037 of 7s. 11d.	4	0¼
13 9		,, labour hanging, ·016 of 7s. 11d., glue and glass-paper	1	9½
		13ft. 9in.)	7	0¼
		Cost per foot supl.	0	6⅛

This price may be analysed in another manner:

	ft. in.		s.	d.
5 0 5 0 2 2 2 2	3 6	supl. of 2in. deal as before at 4⅛d.	1	2½
	7 0	,, planing at ·010 of 7s. 11d..	0	6½
	14 4	run, labour to moulding at ·012 of 7s. 11d.	1	4½
	14 4	,, labour to rebate at ·003 of 7s. 11d.	0	4
	13 9	supl., putting together and cleaning up, at ·016 of 7s. 11d.	1	9
		Glue and glass-paper	0	0½
		Labour hanging, as before	1	9½
		13ft. 9in.)	7	0½
		Cost per foot supl.	0	6⅛

When casements, skylights, sashes, and frames are not specially described or drawn to detail, their various parts can be obtained at moulding mills, at some of which a great variety of sections are kept in stock, or the complete sashes and frames will be made to order from such sections. Sashes and frames are also very frequently sublet. The following are some of the current generalisations about casements, sashes, fanlights, &c.:—

That small sashes, fanlights, or casements 12ft. superficial, and under, are worth 20 per cent. more than larger ones. That casements hung on butts or centres are worth 1d. per foot superficial beyond those which are fixed.

SASHES AND FRAMES.

The valuation of sashes and frames requires some nicety of judgment. The variety of size or thickness of the parts of the frames, the quality of the lines and pulleys, the amount of the labour, and the adoption of several kinds of wood in the same sash and frame effectually test the surveyor's knowledge and skill.

Ordinary sashes and frames are rarely drawn to detail—are very often described but superficially in specifications, and only cursorily looked at when supplied. Even when specifically described, the thicknesses may vary if not watched—1in. pulley stiles instead of 1¼in.; ¾in. inside and outside linings, instead of 1in.; thinner sills, &c.

An ordinary description, such as the following, will serve to illustrate the valuation of sashes and frames.

Deal-cased frames of 1in. inside and outside linings, 1¼in. pulley-stiles, oak double-sunk and weathered sills, and 2in. deal moulded sashes in single squares, double-hung with best flax lines, best brass axle-pulleys and iron weights, and grooved to receive finishings. Assuming the example to be 4ft. by 7ft. = 28ft. superficial.

	ft. in.			s.	d.
	3 3 6 10	22 3	2in. sashes, and hanging, same price as already calculated for casements, 6⅛d.	11	4¼
			7½yds. sash line, at 1d.	0	7½
			4 sash weights (at 10lb.) 40lb. at ½d. per lb.	1	8
			4 brass pulleys, at 10d.	3	4
			4ft. 2in. run, 6in. by 3in. oak sill sawn to shape, 4s. per ft. cube, delivered 6d.	2	1
	4 2 1 0		4ft. 2in. superficial planing on oak, ·020 of 7s. 11d. = 2d.	0	8½
	4 2		run, rebate, 4in. girth, on oak, ·012 of 7s. 11d. = 1d.	0	4¼
	4 1 5½	1 10	2in. deal, *head* 1ft. 10in. supl. at 4⅛d.	0	7¾
4 0 7 0 7 0	18 0 0 4½	6 9	1in. deal, *outside lining*		
2/	7 0 0 4½	5 3	1in. deal, *inside lining*		
		12 0	12ft. supl. 1in. deal at 2⅛d.	2	1½
2/	6 10 0 5	5 8	1¼in. deal, *pulley stile*, 2⅝d.	1	3
2/	6 8 0 5½	6 1	½in. deal, *back lining*		
2/	0 2½ 6 7	2 9	½in. deal, *parting slip*		
		8 10	8ft. 10in. supl. ½in. deal, 1¼d.	0	11
2/	6 8		13ft. 4in. parting bead at 2s. 1d. per 100ft. plus 10 per cent. waste, 2s. 3½d.	0	3½
	3 3	3 3			
2/	6 7	13 2 16 5	16ft. 6in. inside bead at 2/8½ per 100, plus 10 per cent. waste, 2s. 11¾d.	0	6¼
	4 2	4 2	Groove in oak, 4ft. 2in. groove in oak, ·006 of 7s. 11d.	0	2
	4 0	4 0			
2/	6 8	13 4			
2/2/	6 7	26 4	Pulley-stile and back lining.		
2/	6 8	13 4 57 0	Outside lining. 57ft. 0in., groove in deal at ·003 of 7s. 11d.	1	2¼
3/2 11 4/3 1	8 9 12 4 21 1	½/2/ 6 8 6 8	Blocking out to lengths, 1d.	0	6½
		21 1	Labour to moulding, ·012, 7s. 11d.	1	11¾
		21 1	Labour to rebate, ·003, 7s. 11d.	0	5¼
			Glue	0	1
			Glass-paper	0	1
	28 0		Supl., putting together and cleaning up, at ·020 of 7s. 11d.	4	5¼
2/	3 3 3 3	6 6 3 3 9 9	Labour splayed edge to 1¼in. Labour splayed edge to 2in. ·006 of 7s. 11d	0	1¾
	3 3		Labour to groove ·003 of 7s. 11d.	0	0¾
2/ 2/	1 10 1 0 12 0 1 0 5 8 1 0	3 8 24 0 5 8 33 4	Planing. ·010 of 7s. 11d. = 1d.	2	9¼
			28)	37	9¼
			Cost per foot super. exclusive of fixing..	1	4¼

The following are a few of the current generalisations about sashes and frames:—

That sashes and frames under 12ft. superficial each are worth 20 per cent. more than those of larger size.

That the difference between single and double hanging is 1d. per foot superficial.

That circular on plan flat sweep is worth 1½ times the price of straight.

That circular on plan quick sweep is worth twice the price of straight.

A PHOTOGRAPHIC RECORD OF WEST LONDON.

THE West London Photographic Society, with the object of forming a collection of permanent prints of places and objects of historical, archæological, and topographical interest in the West London district, and especially those likely to undergo change or be demolished by so-called modern improvements, has inaugurated a competition, and this week an exhibition of the twelve sets of platinotype photographs has been on view at the Chiswick School of Art, comprising some hundreds of views. The prints under the conditions of this "record" competition are to become the property of the society, the council acting as trustees and controlling the working of the scheme. The hon. curator appointed is Mr. W. H. Whitear, who receives and registers all photographs which are to be tabulated for easy reference, and members are invited to send prints and engravings of buildings and other objects of local interest which have been altered or ceased to exist. The medal has been awarded to Mr. Charles Dixon for his series of 21 full-plate photographs of Lord Ilchester's mansion, Holland House, Kensington. The formal gardens and exterior of the building are capitally shown, giving all the fronts and parts in detail. Among the interiors are the breakfast-room, the library, new ballroom, journal-room, gilt-room, yellow drawing-room, the china-room, Lady Ilchester's private room, the staircase, &c., &c. A plan only is wanted to complete the set. As photographs some of these interiors would not pass muster, but judged as a whole they make a good "record" set. Among Mr. Dixon's other views is a fine print of Little Holland House, now pulled down, and Mr. G. F. Watts, R.A., lives in a new home on the site of his old one; Putney Old Bridge; Thackeray's house in Young-street, Kensington, and in Palace Green; Melbury-road, and a view of the late Wm. Burges's house there. The second place in the competition was won by Mr. J. Stein for a series of 65 views, including the King Charles Room at Treaty House, Uxbridge; Northholt Church and bridge; timber cottages at Horsenden; W. Drayton Church; views of the locks on the Brent; cottages at Pinner; Greenford-lane, Acton, and neighbourhood. Mr. W. H. Whitear obtained the third prize with a very complete and uniform set of about 50 studies illustrating Old Chiswick in a thorough way, with views on the Mall, Chiswick House, the church, and the river. All kinds of subjects were chosen by the competitors, and several old drawings and engravings had been reproduced by photography. The referee appointed to make the award was Mr. Maurice B. Adams, F.R.I.B.A., and the society's medal has been accorded to Mr. Dixon upon the assessor's report.

NOTES FROM PARIS.

THE great "charrette" of the competition for the arrangement of the grounds and buildings for the proposed Exposition Universelle of 1900 is over at last, and those who have for the past three or four months worked at the drawings are now able to breathe more freely, and whilst expectantly awaiting the decision of the Exposition Jury enjoy a well-earned repose. The "charrette," as the final struggle to get the drawings and estimates ready in time is called, is seen at its best in Parisian offices only. It is a rare occurrence for any competitor to have his drawings finished quietly in readiness for the sending-in day. The final rush seems a necessary thing here, and on the night of the 11th December, and in several cases the night before, a hundred of the more important architects' offices in Paris witnessed the last frantic rush, and the customary charrette supper to encourage the midnight workers, the dawn of the last day for sending in arriving too soon, but at the same time welcome, as affording still a few hours of daylight before the final delay, necessary for the finishing touches of colour which may have been forgotten or left until the last moment. The strainers and stretchers were prepared in readiness, and as each drawing was completed it was carried off to the frame-maker, whose turn it was now to hurry and bustle, paste on the drawings, and send them off as best he could before the last hour of sending-in time. Those who were not too tired to follow their drawings to the Palais de l'Industrie did not lack opportunity for amusement, meeting their friends or comrades, some of them supporting as best they could flabby stretchers on which the paste was not as yet by any means dry, others even giving on their way a few last necessary touches of paste or pencil. The number of sets of drawings sent in for this competition is 106, and does not come up to the estimate of many who expected at least a couple of hundred competitors. From a hurried view of the drawings as they were sent in it appears that most of the competitors have taken advantage of the permission given to demolish all existing buildings, and have erected in their place immense and gorgeous constructions much surpassing any of those of the last Exposition of 1889. A number have covered the Seine over the whole length of the exhibition. The Palais de l'Industrie, in the Champs Elysées, where the drawings will be exhibited, has been specially lighted by electricity in order to enable the hanging committee to work by night, and accomplish the hanging of probably over a thousand drawings in the three days following the day for sending in. As the number of competitors is below the estimate, this work will be easily performed in the time given. The public exhibition of the drawings will take place on the 19th inst., and will last fifteen days. The President of the Republic will visit the exhibition the day before the opening. The jury is composed of 31 members, ten members of which are elected by the Minister of Commerce and Industry and ten members by the competitors themselves. The remaining eleven members are composed of the various Ministers and directors of public works and expositions. The first ten members are:—MM. Bardoux, Senator; Leon Bourgeois, Instruction Publique; the President of the Paris Town Council; the Prefect of the Seine; the Delegate of the Colonies; the President of the Committee of Roads and Bridges; the President of Civil Engineers; the General Inspector of Historical Monuments; Daumet, President of the Academy of Fine Arts; and Charles Garnier, architect. The ten members elected by the competitors are MM. Gaudet, Coquart, Pascal, Laloux, Moyaux, Loviot, Sedille, Mayeux, Vaudremer, and Ginain, all well-known Parisian architects. The mode of procedure of election may be interesting. The competitors only who have signed their drawings may take part in the election of the jury. No competitor who has sent in drawings may be elected on the jury. The following measures were taken to insure this: As soon as the last set of drawings were received, a list of all competitors who had signed their drawings was made out and publicly exhibited, the authors of designs sent in under cover of a *nom de plûme* or motto, attached thereto a sealed envelope containing their names. These names were kept secret by the general secretary, who, however, had the right, in the case of any of these names coming up for election on the jury, to declare the person not eligible. The day of meeting for the decision of the jury is not as yet made known, but will probably be during the fifteen days of public exhibition of the designs.

The statue of Meissonier, the late celebrated painter, was inaugurated at Poissy a few days ago, under the presidency of the Minister of Fine Arts. The sculptor is the well-known Fremiet. The pedestal was designed by M. Bourgeois, architect, of the town of Poissy. The minister decorated the architect with the palm of Officer of the Academy.

The prolongation of the Metropolitan railway called Moulineaux is now advancing very fast. The work has been somewhat delayed owing to very important drainage work, necessary to allow the construction of the underground railway. The much-talked-of station of the Esplanade des Invalides is being commenced. Thanks to the cry raised and the battle fought by the Amis des Monuments Parisiens, it has been decided, in order not to spoil the aspect and perspective of the fine Esplanade and the Invalides, to construct the station entirely underground, in the rectangle formed by three streets and the quay adjoining the esplanade. An interesting exhibition of the works of the late sculptor and decorator, Joseph Cheret, is being held at the Ecole des Beaux Arts. Joseph Cheret was the brother of the celebrated designer and painter of pictorial advertisements, whose artistic bills cover the hoardings of Paris and London.

The death is announced of Jean Gigoux, one of the oldest of French painters, and one of the last survivors of the school of romantic painting. Born at Besançon in 1806, he obtained his first success at the Salon of 1833. One of the most remarkable of his works is a vigorous portrait of a Russian general, which may be seen in the galleries of the Luxembourg. At his death, at the age of 88, he was still following his work with the love and passion of a younger man. Much disappointment was expressed here when it was learnt that the late artist had bequeathed his entire collection to the Art Museum of Besançon, when it was expected that the Louvre Galleries would benefit by this valuable collection of paintings.

The directors of the Louvre shops, following up the artistic idea which they started last year, are opening a second competition for a bedroom mirror-cupboard and a bedstead, the sale price of which should not exceed £60. The prizes given are a first prize of £60 and gold medal, a second prize of £40 and gold medal, and a third prize of £20 and silver medal. This initiative will probably soon be followed up by the other large establishments of this kind, and much interest is taken by the public in these open competitions.

The new law relating to cheap dwellings for the working classes has been adopted by Parliament, and has now only to pass before the Senate. This new law, of which the articles have been very carefully compiled and discussed, is very interesting, and will be given more *in extenso* later on. The articles which have been added permit the State to aid the scheme with the sum of about six hundred thousand pounds raised by means of tithes on the patrimony of philanthropical establishments and on the reserve funds of the people's savings bank, held by the State. The Bureaux de Bienfaisance, asylums and hospitals, may, by order of the Prefêt, employ a portion of their money in the construction of cheap model dwellings, or the money may be lent to societies undertaking the work of building these dwellings. Another article frees these houses from the door and window-tax for a period of five years from the completion of the dwelling, or set of dwellings. This freedom from taxation will, however, cease immediately if the dwelling be transformed or enlarged, and loses its character of economical construction, or exceeds the legal maximum of value allowed for such houses.

M. Leclere, French resident at Cambodge, has just discovered at Kanpong-Thom the ruins of 13 towers constructed of brick, and once dedicated to the Brahma divinities; also a roadway raised above the inundation level leading from these towers to the old capital of Cambodge. The discoverer has communicated his interesting finds to the French Academy by means of numerous photographs.

At Vienne, in the Isere department, a very interesting archæological discovery has been made. Whilst excavating below a house known by the name of Palais du Miroir, two marble Roman statues were brought to light. One of these, standing on a perfectly preserved pedestal, is believed to be the Dea Roma. The statue measures over 6ft. in height; the face is full of majestic calm, and the motion of the body may be perfectly followed beneath the folds of the drapery, which itself is marvellously executed. The second statue is that of a young girl. The modelling of the body is perfect. Unfortunately, the head is missing. This latter figure measures only 3ft. in height. The museums of France are fast being enriched by the many archæological discoveries which have lately been made all over the country, and the utmost care is taken by the fine art authorities to preserve as much as possible the objects found, and much encouragement is given to searchers after interesting discoveries of this kind.

It is a question of joining the two rival administrations of State Buildings and that of Fine Arts. Up to the present these two services have been kept separate, and unfortunately much rivalry has existed between the two administrations, which in reality should go hand in hand together for the good of public monuments and art work. In 1870 these two services were united in that of Fine Arts, but for eleven years since the war a separation was made. In 1881 the service of State Buildings was re-attached to that of fine arts, but once again in 1890 the separation was made in spite of all logic.

The Fine Arts service is unable to place a nail in the wall of the museums, or give a coat of paint to the woodwork of the State theatres, without coming into contact with the service of State Buildings, because the walls of the museums and the woodwork of the theatres belong to the latter service. A case in point is one now happening at Versailles. The administration of Fine Arts wishes to replace by a copy the original of the "Raft of Proserpine," now in the Palace Gardens; but the bas-relief, which forms a portion of the group, and is the work of the same sculptor, belongs to the administration of State Buildings. What is to be done in this case is a question necessitating much correspondence and red-tapeism. The whole matter has been brought up by the Minister of Public Instruction, and will probably end, it is to be hoped, in a combination, allowing the service of Fine Arts to combine in its functions, the service of State Buildings more closely attached to art.

STUDENTS' MANUALS.*

AT the outset of the career of an architectural student, before the time has come for comparison and research, and when his mind may be considered as almost a blank with regard to matters architectural, it is of the utmost importance that he should have placed in his hands such books as will give him concisely, and in not too forbidding a manner, a correct idea of the elements of the many branches of architectural art and practice. Fortunately there are excellent works of this kind now to be had, and there is consequently at the present time little excuse for the principal who sets his last new pupil to "draw the Orders," without at the same time placing an architectural history in his hands which will give him some intelligent ideas about them, or who sets him to study this same history out of a ponderous encyclopædia, or to master the principles of carpentry out of some old and hardly-written books. It may be said at once that the powers of draughtsmanship and design are not to be acquired from books at all, but only by long and patient work in company with others who are masters, from whom the spirit must be derived. In books there can be illustrated the drawings and designs of others, constant observation of which, if good, will obviously assist the student; but he cannot learn to produce similar work by such observation only. Nor can he learn how to construct, nor even acquire a real knowledge of manufacturing processes, from books alone. In short, what he reads must in all things be considered as introductory or supplemental only to personal effort and personal observation for himself. Taking the subjects a knowledge of which he has to acquire one by one, let us now consider what manuals are most suitable for the youthful student's reading—concise, correct, clearly written, and up to date. The study of history and ornament should go together. In fact, they are so closely connected that no book on architectural history can afford to pass over all mention of architectural ornament, and special works upon ornament must only be considered as corollaries to history. Here the first book to be read is most emphatically that by Messrs. Smith and Slater, containing all essential elementary points, simply written and well illustrated. If weak anywhere, it is in the chapters upon Gothic work, and upon this it is well to read Rickman's book. Later on, the student naturally takes up period by period separately, using Stuart and Revett's "Antiquities of Athens" (the small edition, and bearing in mind that it was written very long ago), Spiers' "Orders," Rosengarten's "Architectural Styles" (remembering that it was written from a German standpoint), Scott's and Barry's "Academy Lectures," Paley's "Gothic Mouldings" (failing a better and more modern work on the subject, which is much wanted), and Parker's "Glossary." Later again, he is likely to beg, borrow, or steal (for they become expensive to purchase) such large books as Fergusson's "History," Taylor and Cressy's "Rome," Sharpe's "Parallels," and Gotch's "English Renaissance," and many others, the mention of which would serve no useful purpose here. The subjects of materials and construction, again, should go together; and, most fortunately, are treated by two authors upon this plan. For many years now, the first three volumes of the book upon "Building Construction," commonly known as "Rivington," and written by R.E. Officers, has been considered the standard work, and almost the only one which students should read. Now, however, in spite of frequent revision, it has in many respects become out of date, and the many scientific materials in the third volume have also militated against it, while a new book under the same title, in two volumes only, and at a much lower price, has appeared from the pen of one of our own members, Mr. C. Mitchell. This is, therefore, upon the whole, to be preferred, though a student is wisely advised who reads "Rivington" also, and compares the two. These should be supplemented, with regard to tools and plant, by Seddon's "Builders' Work," with regard to showing by Stock's "Shoring and Underpinning" (putting no faith in his chapter upon mechanics, however), and with regard to stones by Professor Lobley's paper, read before this Society a few years ago. Upon the subject of sanitation it is difficult for me to speak, as I am ill-conditioned enough to prefer my own little treatise upon "House Drainage" to any other yet produced. It is well, however, to read Hellyer's "Plumbing," and Beardmore's "Drainage of Habitable Buildings" with it; while those who intend going further into the matter than do most architects must perforce read Santo Crimp's "Sewage Disposal Works." Specification writing and quantities are two subjects which are best studied together, and, though there are many who never take up quantities at all, it is an absolute necessity to the provincial architect to be able to take out his own, and even to the Londoner in large practice a knowledge of them never comes amiss. Upon specification writing there has been no good work in circulation for a long time, and the gap has only recently been filled by the newly-issued book by our member, Mr. J. Leaning, whose work upon quantities has also been the standard textbook for some time past. Whether both of these are eventually to be replaced by the larger volume now appearing in parts, by our other member, Mr. C. H. Searle, yet remains to be seen. Older or cheaper books than either of these are not to be recommended, even if written by well-known men. Under the head of scientific subjects may be taken those depending upon geometry, and those depending upon mathematics. The principles of geometry must, of course, be mastered thoroughly by every architectural student, and no better book for its study has yet been produced than Angell's, his smaller work forming an introduction to the larger, but both demanding careful reading. Arising out of geometry is the study of perspective, a study which, as a rule, is by no means well treated in textbooks, though of recent years one by Fergusson has been produced which meets the needs of the architectural student. Land surveying may also be considered as a subject which springs out of geometry; but it is a branch of applied geometry which is best learnt by actual experience in the field, and, in fact, can scarcely be studied in any other way. Books can assist, however, to a very considerable extent, and there are many good ones, old and modern, possibly the most recent being my own; but in face of others of real value, I will not claim more than reliability and up-to-datedness for it. This subject also demands, in its higher branches, some knowledge of mathematics, and the possession both of Chambers's "Mathematical Tables" and of Boileau's "Traverse Tables," as absolute essentials. The other mathematical subject, of which much is heard, that of the determination of stresses, is one which students had best leave alone entirely, unless they possess real mathematical and mechanical ability, and intend to pursue what all its followers find to be a most fascinating series of investigations to their utmost limits. Other opinions are held by some; but most will probably agree that the mere cramming of a few empirical formulæ, but half understood, for the sake of passing what purports to be but an elementary examination on the subject, is utterly valueless to the architect when confronted with great problems in after life. If it is to be pursued properly, a sound knowledge of statics must first be acquired from Newth's "Natural Philosophy," or any other standard textbook. This done, it is then time to take Professor Adams's "Strains in Ironwork," or my "Stresses and Thrusts," and these may be followed, but not preceded, by the careful study of Rivington, Vol. IV., the most valuable work of this important series, though containing many typographical errors, which have to be very closely watched for. Architectural law is so wide a subject, that no one manual covers it in its entirety. Hudson's "Legal Advice to Architects" will probably but mystify the average student, leaving him with the idea that one very generally recognised set of conditions of contract is utterly bad, but giving him nothing better in its place. Professor Fletcher's "Dilapidations," as also his "Arbitrations," will probably be voted dry, though very necessary to be read by those who aim at becoming specialists in these matters, and Mr. Edgar Farman's paper upon "Light and Air," read before our members, and now twice published by the Society, will always find readers so long as the law stands as it now is. Architectural law, however, is not a subject in which the younger students take much interest, and in later life most men acquire their knowledge of it from general rubbing shoulders with the world, and from the study of the special local Acts of Parliament or by-laws which affect their own particular districts.

---

* By G. A. T. Middleton, M.S.A., A.R.I.B.A., a paper contributed to the *Transactions* of the Society of Architects, December, 1894. (See p. 817 last issue.)

CHIPS.

New schools, erected by the school board for Stone, Kent, on Brent Hill, were opened on Saturday. They provide accommodation for 130 boys, 120 girls, and 100 infants, the main rooms for the senior departments being convertible into one hall. The contractor is Mr. Seager, of Sittingbourne; but the seating was intrusted to the Bennet Furnishing Company, of Glasgow and London. The architect is Mr. J. T. Walford, of Northfleet.

In connection with the Architectural section of the Glasgow Philosophical Society, Mr. Alex. N. Paterson gave a lecture on "Some Principles of Decoration" in the rooms of the society in Bath-street, Glasgow, on Monday night.

A preliminary test has just taken place of the plant which has now been completed for the electric lighting of the Victoria Dock and the Old Docks, Leith. The machinery has been placed in a building adjoining the Commercial Graving Dock. The installation, which has cost about £4,000, has been carried out by the Brush Electric Lighting Company, under the supervision of Mr. E. G. Craven, superintendent for Scotland.

The central block of Winchester Barracks, gutted by fire on Wednesday morning, was built from designs by Sir Christopher Wren in 1683-5, and was built as a palace for King Charles II. At the time of the fire it formed quarters for the unmarried men in the depots of the Hampshire Regiment of the Rifle Brigade.

Dr. Bliss's reports to the Palestine Exploration Fund the discovery of a Latin inscription on a stone in a wall at Jerusalem. It refers to a votive tablet to Jupiter on behalf of the welfare and greatness of the Emperor Trajan and the Roman people, erected by the Third Legion, i.e., in the interval between the destruction by Titus and the founding of Ælia Capitolina.

After hearing the report of Mr. Gall, C.E., Glasgow, who was appointed a neutral engineer to report as to the relative merits of the Glenmassen and Blairmore schemes for a new water supply to Kilmuir, Strone, and Blairmore, the Ayrshire County Council agreed, on Tuesday, by a large majority, to adopt the Glenmassen scheme, estimated to cost £9,340, and remitted it to the Cowal district committee to carry out the scheme in accordance with Mr. Gale's recommendation.

Jasper Isherwood Helme, ex-clerk, collector, and surveyor to Rishton local board, was charged at Blackburn on Wednesday, under a warrant, with embezzling £2,949 12s. 9d., belonging to the board. The original deficiency amounted to over £4,000, but the prisoner had refunded more than £1,000. The prisoner, who pleaded guilty, was committed to Preston Sessions for trial, application for bail being refused.

A meeting of gentlemen interested in the proposal to establish an engineering laboratory for Glasgow University was held in Glasgow on Tuesday, to take steps for raising the £12,500 necessary to fulfil the condition of the offer of from £10,000 to £12,500 by the Bellahouston Trust. Professor Barr explained the scheme, and, after discussion, a committee was appointed, with Sir William Arrol as chairman. Subscriptions to the amount of £3,750 were announced.

The new board schools, Bulwell, Nottingham, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

A mural monument, in memory of the late Canon Eagar, was unveiled last Sunday at the parish church, Ashton-under-Lyne. The work has been carried out by Messrs. Earp and Hobbs, under the direction of the architects, Messrs. J. Eaton and Sons, of Ashton-under-Lyne.

During excavations for the foundations of the new County Hotel at Canterbury, the massive foundations in masonry of a Roman building which formerly occupied the site have been discovered. Two Roman jars, some coins, and a spur are among the objects found during the works.

"ST. CECILIA": A DECORATIVE PANEL.—CHURCH OF ST. MICHAEL, MAESTEG.—THE GREAT HALL, BISHOPSGATE INSTITUTE.—LOCAL BOARD OFFICES, LITTLEBOROUGH.—NEW SCHOOLS, PARK-ROAD, BURSLEM.—CANOPIES TO STALLS AT THE CHURCH OF ST. CROSS, WINCHESTER.—NEW BREWERY AT BLACKBURN—DEVON AND CORNWALL BANK.

Our Illustrations.

"ST. CECILIA": A DECORATIVE PANEL.

This illustration, reproduced direct from the cartoon drawing of the designer, Mr. L. Fairfax-Muckley, represents a panel picture with St. Cecilia, the supposed inventress of the organ, seated at the keys, listening to the accompanying melody of the moaning wind among the trees which serve to furnish the decorative filling of the conventionally-treated background. Her attitude is expressive of virgin grace, and the nimbus round the martyr's head is indicative of Heavenly inspiration.

CHURCH OF ST. MICHAEL, MAESTEG, GLAMORGAN.

This church has been designed to meet the greatly increasing demand for church accommodation in the parish of Llangynwyd, in which parish no less than seven have already been built within the last few years. The building, which accommodates over 500 persons, will be built of native stone, with hard Doulting stone dressings, at a cost of about £9,000. Mr. George E. Halliday, of Cardiff, is the architect.

INTERIOR VIEW OF THE GREAT HALL, BISHOPSGATE INSTITUTE.

We gave on the 30th Nov. last, a few days after the Prime Minister opened the buildings, a view, elevation, and plans of the Bishopsgate Institute. To-day we publish an interior of the great hall, as then promised. The description which accompanied our previous illustrations gave full particulars of the work, and the scheme very ably carried out by Mr. C. Harrison Townsend, F.R.I.B.A., the architect, so that there remains but little to add on this occasion. This great hall is one of the most important features in the group of buildings. The windows are kept well up to permit of ample lighting, and for the purpose of affording good wall space for the display of pictures. A big organ is intended to occupy the recess to the rear of the platform at the end of the hall, and with this end the space has been kept perfectly plain.

LOCAL BOARD OFFICES, FIRE-ENGINE STATION, STABLES, ETC., LITTLEBOROUGH.

This design was awarded the first premium by the assessors, Messrs. Woodhouse and Willoughby, of Manchester, out of 25 sets of designs submitted in open competition. The stipulated cost of the buildings is £4,000, and they are to be erected upon a site situated at the junction of Church-street with Station-road, Littleborough. The sum to be expended being small compared with the amount of accommodation required by the local board, the design had to be prepared with due regard to economy, and an endeavour was made to plan the buildings so as to avoid any irregular-shaped rooms, and to provide ample external light and ventilation throughout. The offices and caretaker's house are to be cellared throughout, in accordance with the conditions of the competition, as the level of the site is considerably below the road, and the space is utilised to the best advantage to avoid filling-in. The basement of the public offices contains the heating-chamber and stores, and is to be approached from the hall, and also by means of steps from the yard in the rear. The principal entrance is planned on the curve of the site, as stipulated by the conditions, and the whole of the offices are provided, as required, on the ground floor. A broad stone staircase leads to the first floor, at the rear of which ample lavatory accommodation is provided for the officials and clerks; this will be entirely disconnected from the main building by means of a cross-ventilated lobby. The first floor contains the board-room, with waiting-room adjoining, a large committee-room, board's retiring-room, and an extra office, with strong-room attached; and the lavatory accommodation for this floor is immediately over that of the ground floor, and treated in a similar manner, and approached from the half-landing of staircase. The caretaker's house is placed on the south side of the public offices, and is disconnected from these buildings by an entrance to the yard at the rear, and contains living-room, kitchen, two bedrooms, and stores in basement. The fire-engine station is on the south end of the site, and adjacent to the caretaker's cottage, and contains engine-room, brigade-room, and superintendent's and pay office, with store attached; stable accommodation for six horses, with hayloft over, harness-room, men's lavatory, bathroom, coal-store, covered shelter for fire-escape, and a cart-shed for eight carts is provided in the rear of the fire-engine station. The elevations facing Church-street and Station-road are to be faced with Yorkshire parpoints with ashlar dressings, in accordance with the conditions, which were prepared by Mr. George H. Wild, the surveyor and clerk to the board. The buildings, which are designed to be of fireproof construction throughout, are in an English Renaissance style, treated in a free but economical manner. Messrs. Clark and Hutchinson, of 28, John-street, Bedford-row, London, are the architects.

PARK ROAD SCHOOLS, BURSLEM.

These schools are now in course of erection for the Burslem School Board. They will occupy a commanding site overlooking the new park. The arrangement is on the central-hall plan, giving accommodation for 440 boys and girls, with a separate block for infants. The buildings will be red bricks and red terracotta, and tile roofs. Internally, the rooms will have glazed tile dadoes and plastered wall and ceilings, and wood-block floors. For ventilation, Tobin tube inlets and roof-extracting ventilators will be provided, and the heating will be by hot water; but an open fireplace will be provided to every room. The schools will be well fitted up with teachers' rooms, cloak rooms, and lavatories; covered play-sheds with latrines, and a caretaker's house. The tender of Mr. Wm. Grant, builder, Burslem, was accepted, amounting to £7,999, and the architect is Mr. A. R. Wood, of Tunstall and Burslem, the architect to the Board.

CANOPIES TO STALLS AT THE CHURCH OF ST. CROSS, WINCHESTER.

Mr. William Butterfield, the well-known architect, who restored and decorated the famous church of St. Cross, near Winchester, writes to us in the following terms concerning these beautiful canopies:—"I am unable to give you any information as to the interesting and refined Renaissance woodwork at St. Cross about which you write. I never could learn anything which was reliable. St. Cross Hospital and its whole property were entirely under the control of the 'master' for the time being, until the resignation of the Earls of Guildford, when a body of trustees was appointed. The master was so independent a person, and the funds at his disposal were so large, that I have always presumed that everything done in the hospital was done by him, and that this woodwork was his quiet gift. Of the date of the gift I know nothing. A gentleman was very anxious some years since to repair it at his own cost; but nothing was done to it—for good reasons, which I need not go into." Being thus unable to obtain any particulars about these canopies, we communicated with the son of the recent Dean of Winchester, Mr. G. H. Kitchen, an architect in practice in that city, who kindly replied as follows:—"Very little can be gathered of the history of these beautiful and unusual examples of Early Renaissance woodwork. They are placed one on either side of the chancel, below the springing of the two westernmost arches, and appear to have had no connection with the seats below. No mention is made of them in Murray's 'Hampshire,' or in Mr. Humbert's (the late master's) book on St. Cross. They are said to have been the gift of Bishop Fox, founder of Corpus Christi, Oxford, who was Bishop of Winchester, 1500-1528. One of the medallions bears a pelican, which was his crest; but the work in itself is of much later character than Fox's beautiful Tudor chantry in the cathedral. These carvings are supposed to be the work of Italians; but, judging from the almost Gothic and very spirited terminal figures, one would be inclined to attribute their origin to Flemish or Belgian workmen. They were sent to London during Mr. Butterfield's restoration of the church, about 30 years ago, and cleaned at great cost from the paint with which they were covered, and there was some talk at that time of having the northernmost screen restored by Italian carvers. It is in a very mutilated condition, but the southernmost screen is almost perfect."

NEW BREWERY AT BLACKBURN.

This forty-quarter plant brewery is now being erected for the Blackburn Brewery Co., Ltd., on a plot of land forming part of an estate recently purchased by them. The fall of the land from end to end has rendered it possible to have two loading sets direct from the cellar and racking-room floor, which will be of great value. The buildings throughout are of the best bricks, with Yorkshire and Runcorn stone dressings. The arrangement consists of the brewery block along one side and one end, with stable accommodation down the opposite side, the offices being placed at the junction of the two main streets. The cellars throughout are lined with blue bricks, and the other floors will be lined with glazed bricks so as to be easily cleansed. The entrance to the brewery is through a massive brick archway surmounted by an arc lamp capable of lighting the yard. The boiler-house is at the top corner, and will be fitted with boilers. The chimney-shaft will be of brick, 105ft. high. It is intended to have the main building finished in May, ready to receive the plant. The contracts have, as far as possible, been given to local men, Mr. John Boland being responsible for the masonry and brickwork; Mr. Willson, of Lower Darwen, near Blackburn, for the joiner's work; whilst Mr. R. T. Eastwood, Mr. S. Cunliffe, Mr. R. J. Duerden, and Mr. M. F. Cooper are responsible for the flagging and slating, plumbing and glazing, plastering and painting, and chimney respectively. The offices will be fitted up in the best manner, having wood-block and mosaic floors all through on the ground floor. The "art of water divining" is looked upon with distrust by the majority of the profession; but this is a case, we are assured, in which it has been eminently successful. Before proceeding with the buildings, the directors, under the advice of Mr. Lecomber, the eminent brewery engineer, sent for the late Mr. Mullins, who, in February last, said that water would be found in abundant quantity below a point indicated by his twig. This supply has been come across within a few feet of his estimate. The work is being carried out under the superintendence of Mr. James Bertwistle, F.S.I., of Blackburn.

DEVON AND CORNWALL BANK, TORQUAY.

These premises have been rebuilt for the Devon and Cornwall Banking Co., Ltd. The buildings have been carried out by Messrs. Vanstone and Mumford, contractors, of Torquay. The architects are Messrs. Geo. Soudon Bridgman, M.S.A., and Norman G. Bridgman, A.R.I.B.A., architects, of Torquay and Paignton.

* * *

A memorial window was fixed in the south transept of Kineton Parish Church last week. There are three openings, filled with large subjects representing "Our Lord Healing the Sick," "Our Lord in the House of Martha and Mary," "The Blessing of Little Children." In the tracery are emblems and ornament. The work was carried out by Messrs. F. Holt and Co., stained-glass works, Warwick.

WAYSIDE NOTES.

A novel housing scheme has been adopted by the Manchester Town Council. It is proposed to clear a space of about five acres in the centre of the City, in an overcrowded and unhealthy area, and to erect blocks of workmen's dwellings. Large areas will be left for playgrounds, and the roofs of the buildings will be left flat and adapted as recreation and playgrounds and drying grounds. Trees and flower-beds will be planted in the open spaces. Several novel features will be introduced into the construction of the dwellings. The cost of clearing the area will be about £250,000.

The tramways acquired by the London County Council are to be leased until some remaining lines are bought over. Provisions have been inserted restricting the hours of labour of the employés of the lessee to 60 per week, or 10 per day. Being of opinion that the lease of the tramways should be the subject of public competition, the Highways Committee recommend that they be authorised to invite tenders. With regard to the section of the London Street Tramways Company's system authorised by provisional orders of 1873, a point of some interest is raised. On Nov. 6 last, the London Country Council decided to give notice of purchase, subject to the approval of the Board of Trade, as required by statute; and at once the company's solicitor wrote to that department pointing out that the tramways referred to are centrally situated, forming part of a continuous system workable only as one undertaking, and asking the Board of Trade to withhold its consent to the service of the notice until 1898, when the Conncil will be in a position to acquire nearly the whole of the company's system. This letter was forwarded to the Council, and has been considered by the Highways Committee, who recommend that the Board of Trade be informed that the Council does not acquiesce in the proposal in question.

The Parks Committee of the County Council reported on Tuesday that they cannot see their way to acquire the small open space in Flower and Dean-street, Whitechapel, "having regard to the smallness of the area, the very high price, and taking into consideration the nature of the surrounding buildings." This will be a disappointment to the people of Whitechapel, and particularly to Canon Barnett and his helpers at Toynbee Hall, who have been working hard to secure this much-needed recreation ground. It is distinctly unjust into the bargain. The London County Council does not count cost at other ends of the town where the need for fresh air and open spaces is far less pressing than in Whitechapel.

In the advertisement columns of a North of England paper appears the following interesting announcement:—

> A Child of God, seeking employment, would like to take charge of property and collect rents; has a slight knowledge of architecture and sanitary; can give unexceptionable references; age 31; married.—Address J. 167, at the printer's.

I wonder whether "J. 167," is one of the brass plate diploma'd fraternity? Let us pray, brethren, for his worldly success, and that pride may not puff him too early into a full blown successful architect.

The nucleus of what may become an interesting local Metropolitan museum has been formed by the London County Council from the finds of relics of bygone days made during the progress of excavations undertaken by that body from time to time throughout the Metropolis. The collection is deposited in one of the rooms of the Council's headquarters in Spring Gardens, where it may be seen by any ratepayer. It is a curious medley, comprising old shoes of the 16th century, bottles, earthenware vases, coins, flint arrowheads, and a fine Egyptian tablet of an early period, found by the workmen while digging the foundations for the new fire-station in Trafalgar-square, Chelsea. A series of old London maps, presented by Mr. Charles Harrison, which are displayed on the walls, are of great interest, as conveying some idea of the vast growth of the Metropolis. In addition the Council has come into possession of the valuable collection of commemorative medals which belonged to its defunct predecessor, the Metropolitan Board of Works, and of the keys of the gates of the various bridges and closed thoroughfares that have been freed from toll, mementoes that will one day be of curious interest to the student of London history.

In one of the most charming parts of Epping Forest stands Queen Elizabeth's Lodge; a small building of two floors, the upper of which is entirely occupied by a moderately-sized square room with windows in each wall, giving a view in all directions round the ample expanse of the forest. This is the only room which is open to the public, the small apartments on the floor below being occupied by the officials, who, on behalf of the Corporation, look after the building. As there is nothing to see in it, the lodge leads a useless existence, but I am glad to observe that it is to be turned to some good account at last. It is to be made into a museum to illustrate the fauna, flora, and antiquities of the forest. The idea is a capital one. Some of the City companies have contributed money in aid of the object, and before long the lodge will contain a very fine collection.

Specifications for the quality of wrought iron often vary in the requirements. That it should be tough, ductile, fibrous, and uniform in quality, free from seams, buckles, blisters, and capable of being worked at a proper heat without injury, are requirements generally admitted. American specifications require that all iron for tension members of open trusses, laterals, pins, and bolts must be made directly from the muck bar: these are to be rolled into flats and again cut, piled and rolled into finished. No scrap will be allowed. As regards the elastic limit, 26,000lb. per square inch is the least required. In tensile members of open trusses, laterals, pins, and bolts 25,000lb. is specified; also for plates over 24in. wide. Tensile strength, limit of elasticity, and ductility are determined from standard test pieces cut from the full-size bar; the area of cross section of these test pieces shall not be less than ½sq.in. for a length of 10in. The ultimate strength and elongation required by tests on full-size tension members vary considerably. In some specifications the ultimate strength demanded of pieces not over 2sq.in. in section per square inch is 50,000lb., and stretch at least 10 per cent. in thin length; others require that tests on full-size bars shall show not less than 46,000lb. per square inch of ultimate strength, and an elastic limit of not less than 25,000lb. per square inch.

A singular revelation with regard to the bricklayer's toil, pay, and habit was made on Tuesday at the meeting of the Liverpool Water Committee. It was stated that the men who had been engaged in lining Llanforda tunnel at Oswestry had been paid at the rate of £4 per week, that they had gone on the spree, and the work had been stopped for four days. The contractor set on other men, giving them double pay, varying from £8 to £10 per week, to complete the work, but they were found tipsy at their toil. Alderman Hughes said the men did not care to earn money unless they had an opportunity of spending it. After working many hours they felt that they must break away, and spend their wages, and they had no desire to save anything.

New National schools at Gilling have just been opened by the Archbishop of York. They have been built from plans by Mr. Brierley, of York, and accommodate 150 children.

Mr. T. W. Thompson, of the medical department of the Local Government Board, held an inquiry at the Council House, Birmingham, on Friday, relative to the application of the city council to borrow £23,400, for the extension of the scarlet fever hospital at Lodge-road. Mr. W. Martin, of Birmingham, produced and explained the plans, which will provide for 300 additional patients.

The extension of the City Lunatic Asylum at Gosforth, Newcastle-on-Tyne, is in active progress. The extension comprises a new range of buildings to be occupied by men, and the whole of the present buildings will in future be used for women. The total accommodation will then be for about 800 patients. The foundations of the main buildings are now almost complete, and these also include the structural work for the scheme of heating and ventilation, which is by a mechanical system. The cost of the buildings and fittings will not be less than £100,000. The architect is Mr. J. W. Dyson, of Grainger-street, Newcastle. The "Burt" Hall and offices are being erected by the Northumberland Miners' Association in Northumberland-road, also from Mr. Dyson's designs. These buildings, which will be very ornate, will cost, including land, nearly £10,000.

DIARIES FOR 1895.

We have received the usual specimens of Messrs. Hudson and Kearns' architects' and builders' diaries, and also of their date-indicating pads, both of which are as welcome as in past years. There are no very novel features in either the diaries or pads this year; but they are fully up to the mark and up to date. In the pads, the "Bankers'" is the newest, and it has had a very favourable reception, we hear. The special diaries and pads for our own and our readers' use have long been perfection. There is nothing else like them.

The City Diary for 1895 (London: W. and H. L. Collingridge) is as handy a shillingsworth as ever. It has a distinct character of its own, and is one of the few we always keep near us for reference throughout the year.

The Rugby Portland Cement Company issues a well got up and useful wall almanac, with illustrations of its works.

OBITUARY.

Sir Oswald Walters Brierly, R.A.Scot., who has been Marine Painter in Ordinary to the Queen for the past twenty years, and curator of the Painted Hall at Greenwich Hospital since 1881, died on Friday at his residence in Ladbrooke-terrace, S.W., at the age of 77 years. During the Crimean War he was present with the fleet during the operations in the Baltic, the Black Sea, and the Sea of Azof. Sir Oswald Brierly accompanied the Duke of Edinburgh on his voyage round the world in 1867, and the Prince and Princess of Wales on their trip up the Nile two years afterwards, and had cruised about for eleven years on various men-of-war and visited all quarters of the globe; an island of the Louisade and a point in Australia were both named after him. He was a member of the Royal Water-Colour Society, and had painted many historical marine pictures. He was knighted in 1886.

CHIPS.

The interesting contents of the Royal United Service Museum, hitherto so little known to the general public, have now been removed to the new premises in Whitehall, and the formal opening of the latter will take place about the middle of February. It is proposed in future to admit the public to the Museum at a small charge.

The Pavilion Theatre in Whitechapel-road, which has been reconstructed from plans by Mr. Ernest Runtz, will be opened on Boxing Day. The entrances, exits, and passage-ways have been enlarged, the ceiling has been raised several feet, and the whole of the auditorium reseated, while the roof over the stage has been raised 32ft. The new façade to the main road is chiefly of terracotta.

The Secretary of State has received from Her Majesty's Agent and Consul-General at Sofia an invitation for tenders for the works to be undertaken in connection with the harbour at Varna. The total cost of these works is estimated at £332,000, and a deposit of £16,600 will be required. The adjudication will take place on January 30 next. The copy of the invitation to tender may be seen on application to the Commercial Department, Foreign Office, S.W., between the hours of 11 and 6.

The City Commission of Sewers agreed on Monday to intimate to the London County Council that the Commission was prepared to construct the City portion of the approach to the Tower Bridge at an estimated outlay of £63,050, the Council paying half the cost, and to improve Thames-street at an outlay of £37,500, the Council contributing a third of the cost. The terms of the arrangement have been suggested by the County Council.

A special meeting of Inverness town council was held on Monday to consider the offers sent in for the construction of a steel girder bridge over the Ness at Waterloo-place, in place of the present wooden structure. Eighteen offers were received from engineering firms, the lowest being £6,985, and the highest £10,916. The council remitted all the offers to the engineers for examination and report.

At Tuesday's meeting of the London County Council, complaint was made by Mr. Antrobus, Mr. Walter Emden, and others that the Council were not getting a proper return of labour for the wages they were paying, and that it was remarked throughout London that there was an enormous waste of time by the workmen employed by the Works Committee. Sir J. Lubbock said the Committee had undertaken an impossible task, and if it were allowed to continue, great loss must result to the ratepayers.

COMPETITIONS.

PARIS.—The jury appointed to examine the competitive plans sent in for the Exhibition of 1900 commenced their labours on Monday. The plans sent in are 112 in number, and are hung in the Salon de Reception at the Palais de l'Industrie in the Champs Elysées. The chief problem grappled with has been the disposition or retention of the Eiffel Tower. Most of the competitors are in favour of preserving the construction, owing to the enormous cost which its removal would entail. Many of them propose, however, to cut it down to the first platform. One daring projector suggests that every building on the Champ de Mars, including the tower, should be swept away, and replaced by a vast hall with an entrance on the riverside. Another shows a plan for covering over the Seine from the Pont de l'Alma to the Pont des Invalides, and for the erection of a Crystal Palace on the space thus obtained. Several competitors are in favour of covering over the Champ de Mars. The jurors will select a plan out of the number presented about the end of the month, and the public exhibition of the designs was opened at noon yesterday (Thursday).

RICHMOND, SURREY.—The design of Mr. T. Locke Worthington, A.R.I.B.A., of Westminster, has been chosen for a small "Free Church," to be erected in Ormond-road, Richmond, and the building will probably be commenced early in the new year.

SWANAGE.—The school board again discussed at their last meeting a proposal that the two architects practising in the town be asked to submit plans for the two proposed new schools, and that two premiums be awarded, the cost not to exceed £7 per child, for the 530 children, for the new schools, exclusive of land and furniture. This was rejected, and the competition will be an open one. The following letter was read :—"Gentlemen,—Having observed that at the last meeting of your board the chairman expressed an opinion that the architect for the proposed new schools could not be chosen by competition, and that no trustworthy man would undertake to do the work for less than a commission of 5 per cent. on the outlay, I beg to inform you that I am ready to undertake to prepare plans and specifications to be approved by the Education Department, and to do all the work which would fall to the architect, including, of course, the proper superintendence of the buildings, for an inclusive commission of 3 per cent. on the outlay. In my opinion, it is not usual in a large job involving the expenditure of £3,000 or £4,000, as stated, to charge more than 3 per cent (!), and I have no doubt, whatever, that if the matter be thrown open for competition, you will have no difficulty in finding a competent man who will undertake it for that remuneration.—I am, yours truly, G. P. D. SAUL, Architect and Surveyor."

WALSALL.—The baths competition is to be re-instituted. At the last meeting of the town council the General Purposes Committee reported that they had come to the conclusion that the erection of the baths should be proceeded with, and that the fairest course would be to invite all the Walsall architects who sent in competitive plans on the occasion of the last competition to send in fresh plans, the size of the first-class swimming-bath to be reduced from 80ft. by 30ft. to 75ft. by 30ft.; the second-class swimming-bath from 60ft. by 30ft. to 50ft. by 25ft.; and the number of slipper baths from 33 to 24; the cost, excluding the Turkish baths, not to exceed £5,000; the architects to be requested to include a suite of Turkish baths at a further cost not exceeding £1,000; and the successful architect to be employed to carry out the work at the usual commission of 5 per cent. The report was adopted.

* * *

Mr. Thomas Rider, the youngest son of Mr. Tom Frank Rider, a well-known and widely-respected member of the London building trade, died at his residence, Durand-gardens, Clapham-road, on Monday, aged 22 years.

Major Durnford, R E., conducted an inquiry at Knottingley, Yorks, on Friday, into an application by the local board to borrow £7,500 for 50 years, proposed to be expended on a water scheme, and also into the proposed modifications of the board's plans for a sewage scheme. Mr. Richardson, C.E., and Mr. Gott and Mr. J. R. Dodds, civil engineers, were present. It is proposed to take the Pontefract mains, and to raise the water to a tower with a storage of 100,000gal., calculated to be a three days' consumption.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

EDINBURGH ARCHITECTURAL ASSOCIATION.—At a meeting of this association, held on the 13th inst., in the Royal Institution, Mr. W. W. Robertson, the president, in the chair, Mr. S. Henbest Capper, architect, read a paper on "The Monks and their Abbeys in Olden Days." Mr. Capper referred to the difference between the monastic life of the East, with its rigid asceticism, and that of the West, where the monks lived together for a common end. When the Benedictines fell away from the strict observance of their early rule, a reformation towards more primitive austerity was begun at Citeaux by Robert of Champagne, and was continued and spread by St. Bernard of Clairvaux, who was characterised by the lecturer as the greatest figure in the twelfth century. The Cistercian Order, to which St. Bernard belonged, also became popular all over Europe, and was especially so in this country, possibly, the lecturer suggested, on account of the more prosaic character of its ritual as compared with that of the Benedictines. By the aid of the limelight a large number of typical examples of Benedictine and Cistercian abbeys and churches were thrown upon the screen, and their points of difference explained. In the Cistercian monastery the lay brother played an important part, and how his appearance there modified the architectural conditions of the abbey buildings was also illustrated and explained. Views were likewise shown of cloisters, kitchens, refectories, &c., and of the internal furnishings of the churches and cloistral buildings. On the motion of Mr. Hippolyte J. Blanc, a vote of thanks was given to the lecturer.

GLASGOW ARCHITECTURAL ASSOCIATION.—A meeting was held on Tuesday, the President, Mr. A. N. Paterson, in the chair, when Mr. T. L. Watson, F.R.I.B.A., delivered the fourth lecture of the winter series, the subject being "The XIII. and XIV. Centuries in Italy." The lecturer pointed out some of the varieties of Gothic architecture that prevailed in the different divisions of the country. The influence of the Classical art of antiquity was felt throughout the whole Gothic period, and was seen in the general effect of breadth, in the horizontal treatment, and the flat surfaces, as opposed to the vertical treatment and the deeply-recessed openings and mouldings of Northern Gothic. It was seen in the indiscriminate mingling of round and pointed arches; in the fondness for the single round pillar or shaft in place of the clustered column, and for the tapered form of pillar instead of the cylindrical form almost invariable in the North. There was a certain defect of the constructive sense seen in the prevalence of the iron tie-rod to hold the arches together, and in the overloading of slender pillars apparently quite unequal to their task. The fact that they are still standing after 500 years is a proof that they are in reality strong enough, and something must be allowed for the known hardness and strength of marble, as compared with the building stones employed in the North. After every allowance is made, however, it has to be admitted that the apparent weakness of many of their buildings is a characteristic and serious defect. A third characteristic was the great wealth of colour produced by various marbles, brick, and terra-cotta, and by mosaics and fresco paintings. Many of the painters were architects also, and even those who were not showed an intimate knowledge of architecture. The paintings were really allied to the buildings, and not merely applied. The architecture painted as accessory to the figures was in harmony with the lines of the building, and the figure subjects also had the architectural qualities of symmetry, restraint, and repose. The architecture, painting, and sculpture of the Renaissance were then touched upon, and the same qualities were illustrated up to the middle of the 16th century, after which there was rapid deterioration.

* * *

Great Barr Church, Staffordshire, has received the addition of a memorial stained-glass window, designed and executed by Messrs. Swaine, Bourne, and Son, King Edward's-road, Birmingham, and London. The subjects are those of "The Good Samaritan" and "The Raising of Jairus's Daughter." The tracery quatrefoil contains the emblematic representation of the Holy Spirit by the Dove. A further commission is to be given to the same artists, the dimensions corresponding.

Engineering Notes.

BIRMINGHAM, STRATFORD, AND LONDON RAILWAY.—The promoters of this line have deposited plans of a Deviation Bill for next session, affecting about 20 miles out of the whole length. The preparing of the engineering work was intrusted to Mr. R. Elliott Cooper, of London, in conjunction with Mr. Winby and Mr. Pritchard, of Birmingham. A small local line has been revised to serve as a first-class main line, with an adequate passenger station and goods accommodation in Birmingham. The new plans show as the steepest gradient 1 in 100. The chief alterations at the Birmingham end are at the Moor-street terminus, where the land scheduled under the new plans is about four acres, or nearly double that of the original station. For the goods traffic, a block about five acres in extent is to be acquired. From Earlswood Reservoir, however, to Stratford-on-Avon, a distance of some 14 miles, the centre line of railway is diverted in some instances upwards of half a mile from last year's plans.

CIVIL AND MECHANICAL ENGINEERS' SOCIETY.—The opening address of the thirty-fifth session of this society was delivered on Thursday evening in last week by the President, Mr. C. T. Walrond, A.M.Inst.C.E., at the Society's offices, 12, Delahay-street, Westminster. The programme for the session is as follows, the meetings being held on Thursday evenings at 7 p.m.:—Jan. 3, "Caissons and Dock Gates," A. W. Ackermann; Jan. 17, "Checking Engineering Calculations," A. Hanssen; Jan. 31, "Engine-room Practice at Sea," W. M. Binney; Feb. 14, "Waste-Preventing Cisterns," E. H. G. Brewster; Feb. 28, "Testing the Strength of Materials," A. S. E. Ackerman; March 14, "Lifts: Hydraulic and Electric," S. à Court; March 28, "Wire-Net Making," A. A. Myall; April 11, "Laundry Machinery," H. Coward; April 25, "Chain-Making," W. Cooper Penn; May 2, "Railway-Bridge Design," Walter Beer; May 9, annual dinner.

THE BLACKWALL TUNNEL. — At Tuesday's meeting of the London County Council, it is reported that the number of claims in respect of properties taken for and injured in the formation of the Blackwall Tunnel had been 231, and the total amount claimed £439,667. All of them had been settled (with the exception of eight) for £317,318. The eight claims unsettled amounted to £7,766, and it was estimated that those would be got rid of by a payment of about £5,000. The Council acceded to the request of Sir Alexander Taylor, the Principal of the Royal Indian Engineering College, Cooper's-hill, that two of the students might be allowed on the works of the Blackwall Tunnel, with the object of gaining experience in the construction of tunnels by means of compressed air, especially as the Government of India would probably have a tunnel made under the river Hoogly at Calcutta.

GLASGOW.—The bridge committee of the town council held a meeting on Friday, at which the estimates for the rebuilding of the Glasgow bridge at Jamaica-street were considered. Twelve offers were sent in, out of which the three lowest were selected and sent to the measurer to be checked, with a view to the ultimate decision. These three estimates were: Messrs. George Lawson and Son—foreign granite, £76,600, and British granite, £78,000; Messrs. Morrison and Mason—foreign or British granite, £81,176 5s.; and Messrs. James Goldie and Son—foreign granite, £91,896 16s. 8d., and British granite, £93,988 2s. 2d. It was decided to recommend to the town council that the offer of Messrs. Morrison and Mason be accepted, the bridge to be built of British granite, and the good material in the old bridge to be used in the construction of the new bridge.

SOCIETY OF ENGINEERS.—The following have been elected by ballot, as the council and officers for 1895, viz.:—As president, Mr. Wm. George Peirce; as vice-presidents, Mr. Chas. Claude Carpenter, Mr. Samuel Herbert Cox, and Mr. George Maxwell Lawford; as ordinary members of council, Messrs. W. Worby Beaumont, Joseph Bernays, R. W. Peregrine Birch, William Bradford, John Corry Fell, Charles Gandon, Henry O'Connor, and Stephen Sellon; as hon. sec. and treasurer, Mr. Perry Fairfax Nursey; as hon. auditors, Messrs. Alfred Lass, F.C.A., and Samuel Wood, F.C.A.

Building Intelligence.

Edinburgh.—Dedication services took place last week in connection with the new Evangelical Union Church at Dalry-road, Edinburgh. The building, which has just been completed, at a cost of £5,000, gives accommodation for 500—four hundred on the ground floor, and a hundred in an end gallery. The style adopted is Late Decorated Gothic, treated in a simple manner. The main gable is filled with a traceried window, which has been filled with stained glass as a memorial. The angle of the building next Murieston Crescent is emphasied by a tower and spire, in the lower part of which is arranged the staircase to the gallery. The materials used in the construction are pink Hailes stone for the rubble facework of the walls, with Doddington for the external and moat stone for the internal hewn work. The internal wood finishings throughout are of yellow pine, the ceiling being treated in the form of a barrel vault with moulded ribs and battlemented cornice. The building has been erected from the plans and under the superintendence of Messrs. Frank W. Simon and Tweedie, Hanover-street, Edinburgh.

London.—The Bath Club, opened this week in Dover-street, Piccadilly, is a distictly new feature in the club-land of London. The cost of the site, building, and furnishing has been about £70,000, including a capital swimming-pond hall to the rear of the premises in Berkeley-street, overlooking the grounds of Devonshire House. Besides the gymnasium bath, there is a very complete series of Turkish, Russian, and other baths with Sudatorium, Tepidarium, Frigidarium, and steam douche; wave and sitz baths attached. These will all be reserved for ladies on three mornings in each week. The building in Dover-street is fitted up with all the convenience and accommodation of a first-class club, with dining-rooms for both sexes, provision for breakfasts being made a special feature of in connection with bathing facilities. A very good billiard-room adjoins the swimming-bath and smoking; card and private dining-rooms for guests are provided. On the upper floors, facing both thoroughfares, there are located about forty bedrooms for the use of members. The main part of the principal building consists of the mansion known as 34, Dover-street, and the internal decorations, in a sort of French Renaissance, forming the original treatment of the house, have been adopted. Mr. Collings B. Young, of Cockspur-street, is the architect, and the contractors were Messrs. Allen and Sons, of Kilburn.

Nicholaston. — The Parish Church of Nicholaston, near Swansea, was reopened for Divine worship on the 6th inst. This little church, one of the smallest in Glamorganshire, measuring only 50ft. from east to west, and seating but 50 persons, has been practically rebuilt at a cost of *over* £6,000. The east end and reredos and chancel windows are of polished pink alabaster. The church is paved throughout with polished Numidian and Devonshire marbles. The roof is of oak, richly carved and decorated. The rest of the joiner's work throughout is of Teak. We have already illustrated the angel cornices in chancel, also the east end. The sculpture throughout has been executed by Mr. W. Clarke, of Llandaff, under the direction of the architect, Mr. G. E. Halliday, of Cardiff.

Washwood Heath, Saltley.—On Saturday the opening of the second section of St. Mark's Church, Washwood Heath, took place. The first portion, the chancel, was built five years ago, at a cost of £700. The church has now been extended by the building of two bays of the nave, with north and south aisles. The building is faced inside and out with red front bricks, with Bath-stone dressings. The roof has massive wood principals, and is tiled. The style adopted is the Decorated. With the recent additions the church will accommodate 240 adults, and when completed 470. The work has been carried out by Messrs. Sapcote and Sons, from plans prepared by Mr. J. A. Chatwin, of Birmingham, architect. The cost of the second section is £1,500.

West Derby.—A group of Roman Catholic Poor-Law Schools, erected as a memorial to the late Bishop O'Reilly, was opened on the 13th inst. They are certified for 192 children, and have cost £10,000. The building measures 238ft. by 113. The building is faced with brickwork relieved by red Ruabon brick string-courses, arches, &c., and red Rainhill stone. Messrs. Sinnott, Sinnott, and Power, of Liverpool, were the architects, Mr. R. J. J. Irwin, of Liverpool, was the clerk of the works, and Messrs. R. Wearing and Sons, West Derby, the contractor.

Wolverhampton.—The new Grand Theatre was opened on Monday week. The building is situated in Lichfield-street, to which it has a frontage of 123ft., while the depth to Berry-street is 122ft., and a passage 8ft. wide on either side isolates it from the adjoining buildings. The architect is Mr. C. J. Phipps, F.S.A., of London. In order that a view of the stage may be obtained from all parts of the auditorium, the proscenium opening has been extended to the width of 33ft. A number of entrances and exits have been provided, and a fire-resisting curtain, weighing seven tons, has been fitted to cut off the auditorium from the stage, while the doors entering upon the stage are also made of iron plates. Seating accommodation has been provided for over 2,000 persons, and running round the back of the seats on each tier is a promenade which will provide standing room for several hundred more. The stage is 65ft. wide by 41ft. 6in. deep. The decorations have been carried out by Messrs. Geo. Jackson and Sons, of London, the tone of colour adopted throughout being white and gold, with claret-colour embossed paper for the walls, and a lighter shade of plush for the curtains and other upholstery.

CHIPS.

Mr. W. Jones, F.S.I., county surveyor of Anglesey, has given his award in the arbitration between the Llangefni local board and Mr. Lewis, as to land acquired for sewerage purposes, assessing the damages at £145.

The Master and Fellows of Peterhouse gave a dinner on Friday last to celebrate the presentation to the college of the portrait of Professor Dewar, painted by Mr. Orchardson, R.A., and exhibited this summer on the walls of the Royal Academy.

The Mayor of the Borough inaugurated on Monday the new scheme for the water supply of King's Lynn, by cutting the first sod of the new wells in the lower chalk. The wells are situated on a range of low chalk-hills, seven miles east of the town. They are to be about 100ft. in depth, with galleries running north and south. It is from the same chalk-hills that Sandringham House now obtains its water supply. To the town it is to be constant, and to the extent of 1,000,000 gallons per day. A supply will be afforded villages in the adjacent district of the Marshland.

The Callender Bitumen and Cable Company, Limited, of London and Erith, who are the contractors for laying the underground mains in Tunbridge Wells, commenced operations last week.

A new church is about to be built at Abersychan, Mon., to seat 300. Mr. Halliday, of Cardiff, is the architect.

The members of the Bristol Clerks of Works' and Builders' Foremen Association held their second annual dinner on Saturday night at the Grand Hotel, Broad-street, Bristol. The Dean (Dr. Pigou) presided, and the company numbered about 80. There were two vice-chairs, occupied by Mr. A. Scull and Mr. W. Woodrow.

A new post-office is about to be erected for the Horseley Heath portion of the parish of Tipton. The building will be of red Ruabon brick and terracotta, with a frontage to Horseley Heath and Horseley-road of about 100ft.

A memorial stained-glass window was unveiled in St. Peter's Collegiate Church, Wolverhampton, on Saturday. The window represents the prophets Enoch, Malachi, and Simeon, and the prophetess Anna.

A volunteer drill-hall has just been completed at Hednesford, Staffs., at a cost of £1,000. The hall, which is of brick, is situated in the Gasworks-road. Capt. Williamson has designed and planned the building, which was built by Mr. Mason, of Hednesford. It comprises a drill-hall, 70ft. by 40ft., with a band gallery, officers' and sergeants' rooms at the end, and an armoury above the latter. The hall is 17ft. 6in. high to the wall plate, and 36ft. to the ridge, the roof being supported by ironwork and provided with skylights.

The Court of Appeal of Aix confirmed on Friday the judgment of the Mentone Tribunal of Commerce by which an English Company, registered in London under the name of La Construction (Limited), and working at August, Cap Martin, was declared bankrupt under French law. The Official Receiver has failed to establish his point, and there only remains to him to accept the judgment, by which English companies will be liable in future to be wound up by French law, or to apply to the Court of Cassation.

Correspondence.

THE MODERN THEATRE OF THE CONTINENT.

To the Editor of the Building News.

Sir,—Mr. E. O. Sachs evidently thinks that I have recently attacked the Paris Opera House as an architectural abortion. This is not exactly the case, as I have a sincere admiration for the many qualities that make it (perhaps excepting Semper's works at Vienna and Dresden) the finest of the 19th-century theatre designs.

In the discussion, however, of my paper on "Modern Architecture" at the A. A. on November 9, Mr. B. F. Fletcher expressed the opinion that 1,000 years hence the Houses of Parliament in London, and the Opera House in Paris, would be found to be equally beautiful with the Parthenon at Athens. This led me to say that before such a lapse of time I fancied that both the 19th-century buildings named would be perceived to be abortions, and would be pulled down rather than be permitted into a category of comparison with the Parthenon.

The Paris Opera House may be king among the mongrels of modern architecture; but when compared with the perfect forms, just beauty, and natural grace of the Temple of the Virgin, Goddess of the Arts, I do not think misconception, or its synonism, abortion, is an inappropriate desciption of its Rococo character and unclassic design.

In short, I did not attack the Opera House any more than the Houses of Parliament, which is equally an architectural misconception; but Mr. Fletcher's suggestion, which I do not think Mr. Sachs will endorse, that these buildings are equal in beauty to the Parthenon, was an attack which I was only concerned in repelling.—I am, &c., Beresford Pite.

20, Hanover-square, W.

ARCHITECTURAL BOOKS.

Sir,—As you have done me the honour of printing my paper on Architectural Books, read before the Society of Architects, in your last number (Dec. 14), will you kindly allow me to point out through your columns that on page 816, first column, line 38 from the top, the word "modern" should follow study, an omission which occurred on the printer's proof handed to you, and which makes a *great* difference in the meaning of the sentence in which it occurs.—I am, &c., Herbert Batsford.

94, High Holborn, W.C., London, Dec. 18.

THE BROMPTON ORATORY.

Sir,—It would be just to record that I was appointed joint architect with the late Mr. H. Gribble, and that the working plans were digested and the works carried out to the completion of the roofs by Mr. Gribble, and—Yours, &c.,

I. T. Walford.

110, Buckingham Palace-road, London, S.W.
Dec. 18.

FLOORS IN HOSPITALS.

Sir,—I have seen your report in issue of 30th inst. on the paper read for the Architectural Association by Mr. Keith D. Young, F.R.I.B.A., on Hospitals and Infirmaries, and the discussion which it brought about, and have waited for somebody more competent than myself to come forward and offer an opinion on the subject.

I am glad to see the greater attention which is now being paid to floors in general, which, according to my idea, are next in importance to the drainage and sanitary arrangements. Indeed, if not properly constructed in the first instance, they will be a source of constant trouble both to clients and architects thereafter, and in a great measure affect the comfort and well-being of the patients.

As a manufacturer of both parquet and terrazzo floors, and as the introducer of the latter and patentee of the most perfected form of block flooring (hydrofuge) in present use, I am intimately acquainted with both kinds of floors, and may be permitted to say a few words on the subject. At the least, my opinion would have the merit of being unbiassed, as I am equally interested in both.

Mr. Young's remarks would imply that it is impossible to produce a hard wood floor block fashion that will not shrink or tilt; but if that were possible, he would give it the preference, and only accepts terrazzo as a *pis aller*.

It is, therefore, hardly necessary for me to dwell upon the fact that if a fair smooth, hard, wood-block floor, free of the defects mentioned by Mr. Young can be produced, little doubt exists that the majority of people would give it the preference over stone, or stone-floor substitutes for ward-floor purposes, as the changes in the atmosphere from cold dry to warm moist, which frequently happen during the winter, cause a surface like this to become dewed over by condensation, and then collect dust and organic matter.

Independent of coldness, hardness, and dustiness, as compared with wood floors, there is a cold and uncomfortable appearance in terrazzo floors when used for living apartments in this country, and little feeling of comfort to be derived therefrom, which to a great extent must react upon the well-being of both patients and nurses.

As to the objection of open joints and tilting of the blocks, given a fair chance and a little forethought and experience, it is quite possible to produce a block floor that will not tilt. The cause of tilting is two-fold—either the floating of the foundation is rough, and there is too great a thickness of asphalte used, or else the bitumen is not of the right description. If these two points are carefully considered, no tilting will occur. It is also possible to further counteract this risk by distributing the weight over a larger surface. This I am doing now by using continuous metal tongues, which bind the blocks together independent of their direct attachment to the foundation by means of my iron dovetail channels. I do not see much objection, either, to have a hard-wood batten across the head and foot of the beds to carry the legs, as an additional protection. This batten could be securely glued and screwed to the floor, and being moulded, with rounded ends, there could be no lodgement for dust or germs.

The cause of the unsatisfactory state of the foundation is often through its being floated at too early a stage of the building operations, thus becoming much worn with traffic over it, a very common occurrence; or of use of insufficient or bad cement; in fact, it seems to be the prevalent idea with foremen that anything will do for a block flooring. Whilst, if it is a question of a first-class job, just the reverse is the case. Another cause leading to want of success is the use of plasterers' sweepings in the concrete, which some months after completion causes swelling and bulging of floors, which is erroneously attributed to the flooring. This, of course, would apply with equal effect to terrazzo floors. The other objection raised—viz., swelling and shrinkage—is more difficult to treat with; but given that care which a specialist devotes to the work on which his reputation and livelihood depend, it can be overcome by careful preparation of the material, skilful labour in laying, and, above all, by judgment on the part of the architect. Architects should make it clear to their clients, and insist upon having the building and concrete foundation thoroughly well seasoned in cases where a good floor free from blemishes is of such importance as it is in a hospital.

Of course, I fully understand there are cases in which the smaller of two evils has to be elected, and where it pays the proprietor better to complete and let and then make good any defects rather than lose a tenant or half a year's rent; but, generally speaking, there is too great an impatience to get a building finished. I have over and over again been asked to lay block floors a day after the concrete foundation has been floated. Under such circumstances swelling and subsequent shrinkage is unavoidable.

Care should also be taken that all hot-air ducts or pipes under floors should be properly isolated, and best not carried under floors, as they cause unequal movement in the case of wood floors, and in terrazzo lead to cracks in places adjoining the ironwork. Slabs of marble or other suitable material might be used immediately in front of, or under front of, fireplaces. Thus the floors would not be subjected to direct strong heat of fires or radiators. It will probably be said, notwithstanding, occasionally a joint may start here or there; nay, even the whole of the floor may imperceptibly shrink all over. An individual open joint can be as readily made good as a crack in mosaic or other materials, and as to a very slight shrinkage all over the floors, that will take place in hot dry weather. If proper precautions have been used, the hardly perceptible open joints will readily be closed hermetically by the periodical use of beeswax or paraffin wax with the necessary brushings, and with the advent of damper or cooler weather will close up of their own accord.

As to small defects, I think there is barely any material used that has not some—e.g., it is impossible to construct a terrazzo floor without at times little pieces scaling out with wear, more especially if unsuitable material, such as Derbyshire spar or stone of similar cleavage, soft statuary or perished marbles are used. If good materials are used, this will not affect the wearing property of these floors. Indeed, Roman cube mosaic in this respect offers greater advantages, as there is less liability of portions of the floors becoming detached, or in the event of any becoming, from some external cause, detached, to their being overlooked.

I quite agree that terrazzo or mosaic floors are quite as good floors as can be had for operating theatres, corridors, or wherever there is traffic that requires prompt and easy cleansing by a hose or otherwise, but I do not think it an ideal floor for a ward any more than for a living-room; and assuming equal care has been bestowed on a hard-wood as on a terrazzo floor, the balance of advantages is in favour of the former. There need be no more lodgment of dirt or infectious matter than there is on terrazzo, or for a matter of that, any other floor, and as to comfort, both actual and sentimental, wood floors are more suited to the requirements and habits of this country than stone floors, although in hot countries like Italy, terrazzo and ordinary brick floors are used, and in summer are perfectly refreshing to the senses. I have often heard that waxed floors are so liable to be damaged with medicines, chemicals, or water being spilled on them. If the liquid is wiped up immediately, and the floor brushed, or, in a more serious case, scraped with a small scraper that any nurse could handle, there need be no more difficulty than there would be with a marble terrazzo floor, which in a bad case, like the upsetting of an inkpot, would require the attendance of a labourer, and rubbing down; in fact, doing what the nurse would do with a scraper on a wood floor; it would also require general cleansing with water, which is certainly more objectionable than cleaning with spirit of turpentine, which would suffice for a wood floor.—I am, &c., Joseph F. Ebner.

Sir,—I am anxious that the correspondence on fireproof construction should not degenerate into a disquisition on the merits of rival patents, and I would not trouble you with a further letter on the subject did not Mr. Fawcett's reference to my last communication demand a reply.

With regard to the fireproof flooring adopted in the new buildings for the Institute of Civil Engineers, Mr. C. Barry, the architect, in declining our tender, said he did so because the estimate of Messrs. Fawcett and Co. was lower, and added that he hoped to have an opportunity in the future of adopting our system.

With reference to the principle involved in *severance* and an *air-current*, I am of opinion that tiles as at present used—I refer to no particular patent—do not supply it. The tiles, the concrete, the steel joists, and the plaster ceiling are all *united*. Hence the heat is communicable to all the parts, tempered only by currents of air in small channels, which channels are nipped into very small proportions under the lower flange of the steel joist, where alone it is needed. This is very different from a suspended fireproof ceiling separated 3in. from the joist, which ceiling cannot communicate heat to the floor above, except through a moving atmosphere.—I am, &c.,

T. Lewis Banks.

71a, Queen Victoria-street, E.C., Dec. 12.

* * *

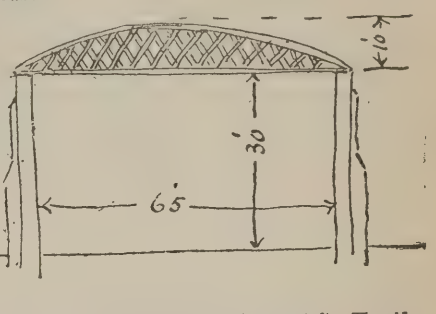
A meeting of the Manchester Association of Students of the Institution of Civil Engineers was held on Wednesday, when Mr. C. H. Wordingham, A.M.Inst.C.E., read a paper describing the Manchester electric-lighting works. These have been designed by Mr. John Hopkinson, F.R.S., and are on the five-wire system. Mr. A. Ross, president of the association, occupied the chair.

The ratepayers of Blackpool have rejected at the poll, by a large majority, what is known as the Gynn scheme, one of the largest undertakings ever proposed by the corporation. The scheme included the purchase and laying-out of the North Cliff at a cost of over £60,000. The land will now be bought by a local syndicate.

Intercommunication.

QUESTIONS.

[11266.]—**Acoustics.**—I am designing a hall for general purposes—public meetings, concerts, theatrical entertainments. It is 110ft. by 65ft., and has a gallery at one end and a stage at the other. The section is as follows:—



There is a wood lattice principal at every 10ft. The side walls have a window in each bay, and these walls are flat, with the exception of a pilaster 2ft. wide projecting a few inches at each principal. I believe these wood principals will break up any reverberations of sound which may be likely to occur, and that the hall will be a good one for acoustics. Will any of your readers tell me if I am correct, and that the above hall will be a good one in which to speak and sing?—Acoustics.

[11267.]—**Masonry.**—Will some reader kindly give the name of the author for a good book on masonry, giving particulars of setting out, measurements of stonework, and labours upon same?—G. T. S.

REPLIES.

[11258.]—**Wall Sinking.**—The building, which is not erected yet, will be 18ft. by 52ft.; it is to be a provision store, with a cellar of 26ft. long, two floors, and roof above; 16ft. of front (shop windows) will rest on girders (iron). Can you advise me further if it is necessary?—F. M. Pentecost.

[11263.]—**Sewer.**—By Section 4 Public Health Act, 1875, this surface-drain is a "sewer," by taking the sewage of more than one house. By Sections 15 and 19, the local authority are to keep in repair all sewers belonging to them, and to cause such sewers to be kept so as not to be a nuisance or injurious to health. By Section 13 all "sewers" vest in the local authority.—J. Ainsworth Settle, Bolton.

[11263.]—**Sewer.**—The drain referred to is clearly a sewer under the Public Health Act.—H. L.

[11264.]—**Golf.**—Linseed-oil well rubbed in several times recommended.—J. A. Settle, Bolton.

[11264.]—**Golf.**—In all my experience I have used vaseline for the heads of brasseys and drivers. Oil should not be used for shafts, but try White's best furniture polish. American bungwee is very good also.—P. W. G.

[11265.]—**Society of Antiquaries.**—To become a member of this society a form of nomination must be obtained through a member, as no forms are issued to the public, nor are lists of members given away. Having obtained this form the candidate must get the signatures of several Fellows, and if elected will have to pay £8 as an entrance fee and three guineas per annum. I may add that architects are not looked upon with favour by the society.—H. L.

CHIPS.

The work by David, known as "Portraits des Dames Bataillard," painted in Brussels between 1815 and 1820, has been acquired for the Louvre.

The parish church of St. Donats, Bridgend, has just been reopened for divine worship, after having undergone careful reparation. Mr. Halliday, of Cardiff, was the architect.

At a meeting of the Property Holders' Union of Great Britain held at Gateshead, on Friday, Mr. Matthew Storey, of Jarrow-on-Tyne, was appointed secretary, in succession to the late Mr. Rotherford. The annual conference will be held at Bradford next spring.

Col. Hasted, inspector to the Local Government Board, held an inquiry at the town hall, Eccles, on Friday, into the application of the town council to borrow the sum of £3,329 for works of private street improvement in various parts of the borough.

The death is announced of Mr. Henry Thring Shayer, of Shirley, Hants, the landscape painter, at the age of 70 years. His father, the still-more widely-known artist, died at Shirley 15 years since, at the ripe old age of 92.

Judgment was given on Friday, in the Court of Appeal, by the Master of the Rolls and Lords Justices Lopes and Rigby, on the application of the Rector of Marylebone, to compel the Vestry to make a rate for the repair of the parish church and the St. John's Wood Chapel. Justices Mathew and Day had refused to make such an order, but they directed the Vestry to hand over the fees received by the Burial Board for the repair of the buildings. That judgment was affirmed, and no order was made as to costs.

Legal.

NUISANCE BY WATER.

In the crowded life of cities and towns, buildings are so closely pressed together that it is often very difficult to provide for the rights of adjoining owners and occupiers in the way of drainage and overflow of water. There have been numerous cases arising out of these conflicting rights, and in the recent action of "Gill and others v. Edouin" (*Times*, Dec. 5), some useful principles were laid down by Mr. Justice Wright. It was a claim by the lessee of a house in the Strand against the lessee of the Strand Theatre for damages for injury done by the overflow of water upon their premises. The facts showed that upon a part of the defendant's place there was a flat roof over an area, upon which the four surrounding houses discharged rain-water by the usual pipes, and from which the water escaped by means of an ordinary gully through another pipe into the drain. This gully somehow or other got stopped up, and in consequence, water flowed through a window into the plaintiff's premises. It was argued that as the roof was upon the defendant's premises, it was his duty to look after it, and to keep the gully clear. In other words, it was contended that the defendant was bound to receive and pass on the water from the adjoining houses, and he came within the principle that anyone who by artificial means has collected water upon his premises, which he allows to flow over on to the land of an adjoining owner, is liable in trespass for the damage done.

Mr. Justice Wright admitted that *primâ facie* an owner of land had a proprietary right not to have his premises invaded by injurious matter coming from his neighbour's land otherwise than in course of nature. But this general principle was liable to several exceptions, as when the owner used his land in the ordinary manner, and damage happened to his neighbour without his negligence, or where the plaintiff consented to the defendant's collecting water on his land, and there was no proof of actual negligence. The judge held that in this case the defendant only used this roof and its gully in the ordinary way, and, more than that, the whole thing was equally for the benefit of the plaintiff, who drained his roofs through the same pipe. So the defendant would not be liable except upon plain proof of his negligence causing the damage, of which the judge thought there was not sufficient evidence. In fact, the plaintiff failed to to prove that it was the duty of the defendant to keep this gully clear for the benefit of his neighbours, and that he had failed to do so.

Fred. Wetherfield, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

E. A. B.—Highway.—Footpath.—Paving.—The footpath should be properly made and laid by the urban highway authority. But it need not be paved with stone flags necessarily. If the path is grossly neglected after notice, it would become a public nuisance, for which there would be a remedy by indictment.

Cistern.—By-laws.—Old Buildings.—I do not consider that these regulations can be applied to old houses, under the circumstances stated by the sanitary inspector. But the water company may be able to make the same requirements.

Long Subscriber.—Rates.—Assessment.—I really cannot answer these six complicated questions in this column, but must refer you to a local solicitor used to such matters, or to one of the textbooks on the law of rating.

Querist.—Waggons.—Contract.—I think the clause would apply to both parties. But even without it, your then position could not be prejudiced by their giving notice, which could not be allowed to have a retrospective effect.

P. B.—Valuer.—Architect.—License.—I consider that, as has been already stated, no such license is required.

C. W.—Party-Wall.—Difference.—Award.—This appears to me to be valid, as far as I can judge from what is here stated. It is, of course, subject to the appeal provided by the statute.

◆

The Chorlton board of guardians have under consideration a proposal by a committee that plans for cottage homes, including workshops, schools, an administration block, and a swimming-bath be invited by public competition, and that a first prize of £75 be offered for the best design, £50 for the second best, and £30 for the third. The plans to be the property of the guardians.

LEGAL INTELLIGENCE.

Contracts with "Clubs."—Gould and Brand v. Piccadilly Club and Others.—The Lord Chief Justice, with whom was a special jury, tried on Friday this action brought by Messrs. Gould and Brand, a firm of builders, against the Piccadilly Club, W. J. Bonham, the secretary of the club; J. R. Douglas, and Messrs. Gillow and Co., to recover the sum of £2,425 17s. 8s. for work and labour done and materials provided by them at the defendants' request at 128 and 129, Piccadilly, in accordance with the drawings, specifications, general conditions of contract, and bill of quantities duly certified by Messrs. Boehmer and Gibbs, the architects. The defence was that credit was given to the "club," who did not appear ("Piccadilly-chambers, Limited," having entered an appearance to the action on behalf of the club). The case arose out of the alterations made at 128 and 129, Piccadilly, in order to prepare the premises for the Piccadilly Club. Messrs. Gillow had leased the property from the "Sutton" estate, and in March, 1892, they sold the houses in question to Mr. Douglas, who had been connected with the New Travellers' Club, the price being £41,000. Messrs. Gillow afterwards made advances to Mr. Douglas, but the plaintiffs' contract was with Mr. Bonham "for the Piccadilly Club." It was, however, alleged on the plaintiffs' behalf that the sale to Mr. Douglas was a mere form, and that Messrs. Gillow were always principals in the matter, financing him when necessary. Mr. Brand, one of the plaintiffs, was called and examined at great length, and, in cross-examination, he said that when he signed the contract he took no trouble to inquire particularly as to whom his contract was with. He had, however, heard previously that Messrs. Gillow and Mr. Douglas were really the "club." At the suggestion of his Lordship, counsel consulted together with a view to a settlement, and eventually Mr. McCall, Q.C., said that Messrs. Gillow, while denying that there was any ground for suggesting that they were ever "principals" in the matter, thought that a letter written in November, 1892, might make them morally liable, although not legally so, and they therefore consented to pay the plaintiffs £1,500 in full discharge of the debt and costs. The record would be withdrawn, and the names of Mr. Douglas and the Piccadilly-chambers (Limited) should be struck off. There would be judgment for Mr. Bonham, and the plaintiffs were to pay him 50 guineas for costs. The Lord Chief Justice remarked that the case had already been tried before Mr. Baron Pollock in April last, and went to the Court of Appeal in June. It was more than probable that, had the case been fought out now, it would have again gone to the Court of Appeal. Most of the trouble had arisen through the plaintiffs signing a contract without inquiry, and without ascertaining clearly in black and white with whom they were contracting.

Re Wm. Stubbs.—This first meeting of creditors was held in this case on Friday, the debtor trading as a contractor at Phœnix Wharf, Commercial-road, Lambeth. The accounts showed unsecured liabilities £5,206, and debts fully secured £104,243, the assets being returned at £23,107, including an estimated surplus of £20,966 from the securities held by creditors. The debtor made no proposal, and it was stated that his affairs would be wound up in bankruptcy. An accountant was appointed trustee of the estate, together with a Committee of Inspection.

Re John Knight.—The bankrupt, a builder at Marsham-street, Westminster, applied, on the 13th inst., for his order of discharge. He attributed his failure to want of capital, loss on a contract entered into with the London County Council, to heavy interest on money which he was compelled to borrow in consequence of alleged delay in obtaining payment from the Council, and other causes. Proofs amounting to £1,884 had been made, and the total unsecured indebtedness amounted to £2,270, or thereabouts. The trustee reported that a dividend of about 3s. in the pound was likely to be paid to the unsecured creditors. There was no opposition on the part of creditors, and the discharge was granted subject to a minimum statutory suspension of two years.

Tenants' Liabilities.—In the City of London Court, on Friday, before Mr. Commissioner Kerr, an action was brought by Mr. Albert Saunders, Great St. Helen's, E.C., against Mr. Charles Ruffell, Denmark-road, Camberwell, to recover the sum of £28 for work done to his house under the requirements of the Public Health Act. The defendant was the plaintiff's tenant of a house in Denmark-road, Camberwell, and while the defendant was in occupation the plaintiff was served with a notice by the sanitary authorities to do certain repairs. Those had been done, and the defendant refused to pay the bill, although he was responsible. The defendant's case was that the repairs constituted structural improvements, and, therefore, the defendant was not liable. Furthermore, the plaintiff, by letter, agreed to do any repairs to the drains that were found to be necessary. That letter was written by the plaintiff before the defendant signed the lease of the premises. The defendant had now been called upon by the plaintiff to pay for doing drain work, including alterations to a water-closet. Mr. Commissioner Kerr said it seemed monstrous that tenants should pay for putting landlords' property in sanitary repairs. After further evidence, the learned Judge said it was evident that the plaintiff could not make the defendant pay for repairs to the drains, as the plaintiff had undertaken to do that in his letter. But he could not say that repairs to a water-closet could be included in repairs to a drain. The defendant would, therefore, have to pay for the cost of putting the water-closet in order, and the amount would be fixed by a surveyor to whom he would refer the matter.

Damages against a Vestry.—Beall and Buss v. Shoreditch Vestry.—In an action heard by the Lord Chief Justice, on Saturday, the plaintiffs sued the Vestry of St. Leonard, Shoreditch, to recover damages for injury to five houses in Tuileries-street, Shoreditch, of which they were tenants in common. The plaintiffs' case was that the defendants, in the course of altering and enlarging a sewer, did not take reasonable care to prevent any damage to the property in the neighbourhood, with the result that there was a subsidence, to the great detriment of the plaintiffs' houses. The plaintiffs alleged that the sewer was constructed in too long sections; that sand and gravel were excavated and carted away instead of being used to fill up the sewer trench; that the trench was not properly filled up; delay in the construction of the works; that the trench was not properly timbered; and that the houses were not properly shored up. The defence was that the works were carried out under the defendants' statutory powers, with all reasonable care, and that, therefore, they were not liable. The damage, it appeared, was caused by water percolating through the soil, which, it was said, could not be prevented.—The jury returned a verdict for the plaintiffs for £198 6s. Judgment accordingly.

An Architect and his Fees.—Lee v. Thunder.—This case came before Mr. Justice Wills, sitting without a jury in the Queen's Bench Division on the 13th inst., it being brought by Mr. F. Lovell Lee, architect and surveyor, to recover 2½ per cent. commission on the proposed cost of a building, of which he prepared the plans and specifications, and also to recover £74 which he had paid to Mr. Verity, quantity surveyor, for work done at defendant's request. The defence was a denial of the retainer, and there was a counterclaim in which it was alleged that the plaintiff failed to deliver the plans within a reasonable time. Also that the plaintiff had represented that the cost of the building would not exceed £3,500, whereas it was afterwards shown that it would exceed that sum, and therefore that the plans were useless. The plaintiff suggested to defendant that certain land in the Fulham-road could be utilised for middle-class flats. Defendant requested the plaintiff to get out a rough tracing of the proposed building. A month later, in February 1893, plaintiff arranged with Mr. Verity to make out a rough estimate of the quantities on the terms that if the matter fell through nothing was to be paid. Mr. Lee, having obtained from Mr. Verity an approximate estimate as to the quantities, at £3,700, gave it to defendant, who expressed himself satisfied with it, and then intimated that if his client would agree to it, he would, and that Mr. Lee was to go on preparing the plans. Instructions were given about the time for the contract of sale to be drawn up and executed, and such contract was drawn up and executed some time in March. By June Mr. Verity had completed his quantities. Plaintiff said that he did not consider himself employed up to the time the contract for sale was prepared. On several occasions he told defendant that he could not prepare the working drawings, specifications, and quantities on mere speculation, but that he should require payment on the usual terms. Defendant replied that if the scheme went on he should be engaged as the architect. On February 23rd defendant told him he intended to purchase himself. He then prepared the party-wall notices, and defendant signed one and gave it to him (witness) to serve. In April or May he was laid up for some little time, and could not proceed with the plans. On June 27th the defendant requested him to try and sell the property for him for £1,000, as he did not propose to build himself. He tried to sell the property, but did not succeed. He had employed Mr. Verity, and paid him £74. Cross-examined: He did not do a considerable amount of work on speculation. The plan was slightly altered, as the rough sketch contravened the Building Acts. Plaintiff did not take out the quantities as he was not a quantity surveyor, and could not do it. Giving a preliminary estimate and taking out quantities were very different things. Mr. Ernest George Verity, quantity surveyor, said that the proposed building could have been erected for £3,700. Cross-examined: He looked to Mr. Lee as the person to pay his account, because Mr. Thunder had authorised him to get the whole thing done.

He never applied to Mr. Thunder for payment. He did not make his original estimate by the cube, but by measurement. Mr. Robert Griggs, an architect and surveyor, said he had examined plaintiff's drawings and Verity's estimate, and considered it a *bonâ fide* estimate at which the work might reasonably be expected to be carried out. The plans showed that the flats were for middle-class people. Sixpence per cubic foot was a reasonable price for such a building. For defendant, Mr. Charles King, builder, Blackfriars-road, deposed that he had examined the plans some months ago. He had priced up the quantities in accordance with the plans, and his figure was £4,548 17s. 10d. Sevenpence-halfpenny per cubic foot was the ordinary price for buildings of the class. Mr. J. A. Osborne, M.S.A., manager to Messrs. Stocker, architects, 99, Cheapside, considered 8d. per cubic foot as the proper price to take on such a building as the proposed. Mr. Stubbs, an architect carrying on business in Regent-street, said that he had had a large experience in the erection of flats. The plaintiff's final plan did not comply with the requirements of the Metroplitan Buildings Act. The flats could have been built at 7d. per cubic foot, but not for less. He should have estimated the cost at 8d. per cubic foot. Mr. Isaac Mason, architect and surveyor, thought that 7d. per cubic foot would be a fair price to estimate the cost of the flats. Mr. Arthur Tattersall, auctioneer and house agent, Hammersmith-road, and the defendant, having given evidence, his Lordship, in giving judgment, said that some of the evidence called for the defendant was not reliable. Mr. King's evidence, to his mind, was totally unreliable. No evidence had been called by the defendant to satisfy him that the plaintiff's estimate was not a fair and reasonable one. Everyone knew perfectly well that when once litigation was embarked in, any quantity of that kind of evidence could be obtained. Witnesses could be procured without any difficulty to differ not only to the extent of 20 or 25 per cent., from the witnesses of the opposite party, but, if necessary, by 75 or 200 per cent. He thought the plaintiff had made out his case, and, therefore, gave judgment for him for £166 10s., with costs.

Roadway Apportionments. — The Clacton Local Board v. Young and Sons.—This appeal, heard on Friday by Mr. Baron Pollock and Mr. Justice Grantham, dealt with a question which has arisen between the local board of Clacton-on-Sea and the owners of land on the shore, who are building houses there fronting the sea, as to the apportionment of expenses incurred in laying out the new property. Messrs. Young are owners of a row of houses lately erected, fronting the sea, with a broad footway before the houses and between the houses, and a roadway 36ft. wide to be laid out between the path and a green sward or lawn between the roadway and the sea, of which sward the board are owners. The question had arisen as to the apportionment of the expense. As to the expense of the broad footway between the houses and the road, the local board sought to throw the expense on the owners of the houses. This the owners resisted, claiming that the expense should be divided, and the magistrates so held, but stated a case to raise the question. Mr. Baron Pollock, in giving judgment, said Clacton was a new watering-place, and the question had arisen as to the apportionment of the expenses. The board desired to throw the expense of the footway on the owners, but the magistrates thought that it ought to be apportioned between the owners and the board. In his judgment that decision was correct. It depended on section 10 of the Private Street Works Act of 1892. It was a new street, and it was proper that the expense should be apportioned among all the owners of property abutting "upon the street." The appeal, therefore, must be dismissed. Mr. Justice Grantham agreed. Appeal accordingly dismissed, and decision of magistrates affirmed. Leave to appeal refused.

Lodging Money.—At Lincoln County Court on the 17th inst., Chas. Draper, Carholme-road, Lincoln, sued H. and W. Close, contractors, Lincoln, for 10s., five weeks' lodging money. In September the plaintiff was engaged by the defendants at Heighington, and sent in a claim for 2s. lodging money at the end of the first week. The foreman refused to pay it, but on plaintiff refusing to continue on the job, told him to return and it would be all right. On finishing the job, he again applied for lodging money, and was discharged. Three members of the local branch of the Society of Joiners, named Holmes, Bellamy, and Willows, gave evidence in support of Draper's claim. He was taking less than the society's rate for an average workman. George Smith, foreman to Messrs. Close, said he engaged the plaintiff for the Heighington work, and told him that he would have to live there, but no lodging money would be allowed. He was put on to work for eleven weeks as a favour. Mr. Wm. Henry Close, the managing partner of the defendant firm, said he was president of the Lincoln Master Builders' Association. The dispute as to lodgings had nothing to do with Draper's dismissal, which took place because he was considered incompetent. His Honour, Sir Sherston Baker, in giving judgment, said this was a special contract; that the plaintiff was warned that he would not have any lodging money, but if there had been no special contract the rules applied only to average workmen, and he was by no means certain that the plaintiff came under that head. He found no fault with plaintiff for bringing the action, which was largely due to the obscurity of the rules. Judgment for defendants, with costs.

Making-up New Roads. — Bromley Local Board v. Lansbury.—In the Queen's Bench Division, last week, Mr. Justice Grantham and Mr. Justice Lawrence gave judgment in this case, an appeal by the Bromley Local Board in an action tried at the Bromley County court. The local board sought to enforce a charge under the Public Health Act, 1875, of £42 10s. 5d. in respect to Nos. 28 to 30, New Homesdale-road, Bromley, upon the estate of the late Thomas Lansbury, the amount being an apportionment of the cost of making up the road, which was laid out in 1878. In 1884 an arrangement was come to between Lansbury, a frontager, and the local board that the new road should be made up to the satisfaction of the surveyor of the board, and should be kept in repair by the frontagers for six months, and that the board should then adopt the road. This arrangement was carried out, but the board did not, after the expiration of the six months, give the usual notice of adoption under section 152 of the Public Health Act, 1875. Subsequently, the road fell into disrepair. In 1888 the board served Lansbury and the other frontagers with a notice, under section 150 of the Act, requiring them to make up the road. This notice was not complied with, and accordingly the board executed the necessary works, afterwards serving the frontagers with notices of apportionment of expenses, and ultimately commenced this action. On behalf of the board it was contended that the case came within section 152 of the Public Health Act, 1875, and that, therefore, the board had no power in 1884 to take over the road, because all the requirements of section 150 had not been complied with. On the other hand, it was argued for the defendant and held by the County-court judge that the case came within section 146 of the Act, which section gives the local authority power to agree to the making of a new road without requiring any of the particular things specified in section 150 to be done. The County-court judge therefore held that the board was bound by the arrangement come to in 1884, and could not now throw the cost of further repairing the road upon the frontagers. Judgment was accordingly given for the defendant. The local board appealed. Mr. Justice Grantham said that it was impossible to doubt that the local board had treated the road as a new road under section 146, and that it was to their interest to so treat it. Lansbury acted on this decision. It had been said that the agreement with the board was not under seal, and therefore not binding; but that really was immaterial, for the question was whether the work done by Lansbury under the agreement had been accepted by the board, and the County-court judge had found as a fact that that was so. They could not interfere with that finding, and the appeal would, therefore, be dismissed. Mr. Justice Lawrance concurred.

A Glasgow Railway Arbitration Case.—Decision was given recently in an arbitration case in which the trustees of the New City-road Congregational Church claimed £3,150 from the Glasgow District Subway Company for alleged damage to their property in connection with the construction of the subway. The members of the Arbitration Court were Sheriff Lees, oversman; Mr. Barr, C.E., and Mr. Mayberry, arbiters. The arbiters having met, and being unable to agree on the sum that should be awarded, the case devolved on the oversman, who has found the claimants entitled to a sum of £1,057 2s. Mr. W. R. Copland, C.E.; Messrs. Robert Murdoch and Muir, builders, and others gave evidence in support of the claim; and Messrs. David Guthrie and Barlas, builders, and Mr. Turnbull, C.E., along with others, gave evidence for the Subway Company.

Re E. A. Cracknell.—The bankrupt, an estate agent and surveyor, carrying on business in Marylebone, has applied for his order of discharge. The receiving order was made in June last, the liabilities being returned at £8,857, and assets nil. The Official Receiver reported that the bulk of the liabilities were contracted in connection with speculative building and financing operations, which the bankrupt entered into without sufficient capital. Mr. Registrar Giffard said the bankrupt had not taken warning from a previous failure in 1882, but had continued his speculative career, having no regard for his creditors, but hoping only to make a fortune by rash and hazardous ventures. The discharge would be suspended for five years.

Sky Signs Defined.—Messrs. Gooch, of Brompton-road, were summoned by the London County Council to Westminster Police-court, recently, day, for retaining sky signs without a licence. Mr. Townsend, surveyor in the office of the superintending architect of the Council, said that what was complained of was a framed name board resting on the parapet wall, and supported by iron stays to the roof. Witness also treated as sky signs a number of raised wooden letters, which were 2ft. 6in. above the ordinary line. All the projections were visible against the sky. Mr. Cluer, for the defence, contended that there was a sloping roof behind, and that the name board and numbers went no higher than the roof at its highest part. Mr. De Rutzen said he had adjourned these summonses in order to see whether the defendants would make any application for a license, as he thought it essentially a case for a compromise of some sort. He thought, also, that the board and figures were a sky sign within the meaning of the Act. Mr. Cluer: I ask for a nominal penalty in each of the six summonses. Mr. De Rutzen: Very well, I will make it a fine of 1s. and 15s. costs in each.

CHIPS.

Among the candidates for the urban district council for Grays, Essex, is Mr. Charles Cobham, F.S.I., until recently the surveyor to that authority.

The Hall of Modern Sculptures at the Luxembourg is about to be increased in length. The adjoining picture-galleries, which are already crowded to excess, will also, it is said, be considerably enlarged.

The widow of the late Mr. John Gregory Crace, the well-known decorative artist, died on Friday, after a short illness, at Palace-court Mansions, Bayswater. Mrs. Crace was in her 80th year.

At the last meeting of the Common Council for the City, the Bridge House Estates Committee recommended the payment to Mr. John Wolfe Barry of the sum of £12,000, as an additional remuneration as engineer of the Tower Bridge. The consideration of the report was adjourned.

The new science and art schools adjoining the Guildhall at Wrexham were opened on Friday.

The monthly report of the Labour Department states that, owing to seasonal causes, some falling off in employment in the various branches of the building trades is reported, particularly among the painters. The percentage of unemployed was 4·2 in November, which compares with 3·7 in November, 1893. Little change has taken place in the condition of the furnishing and woodworking trades. The proportion of unemployed has fallen from 4·6 per cent. in October to 4·5 per cent. in November. Nine new disputes arose in the building trades, none being of any magnitude or importance.

The Institution of Electrical Engineers held their annual meeting on Friday night in the hall of the Institute of Civil Engineers, Mr. Alexander Siemens in the chair, when Mr. R. E. Crompton was elected president. The report gave a good account of progress in finances, and the number of members is over 2,300.

A brass has just been placed in the crypt of St. Paul's Cathedral to the memory of the late Colonel James Augustus Grant, C.B., C.S.I. The tablet contains a portrait medallion in alto-rilievo, surrounded by Scotch fir-tops, the badge of the Grants, while on the lower portion there is a perspective view of the Victoria Nyanza, commemorative of the discovery of the source of the Nile. Messrs. Barkentin and Kraal carried out the work.

Judge Gwilym Williams has offered a prize of £10 for the best plan of a chapel at the Llanelly National Eisteddfod.

The foundation-stone of a new mission-room in connection with St. Silas's Church, Lozells, Birmingham, was laid on Friday. Until recently an iron structure on a site at the corner of Nursery-road and Wellesley-street has been used as a mission-room, and it is now proposed to erect a building to the designs of Mr. J. P. Osborn, of Birmingham, architect, to accommodate 350 persons, at an estimated cost of £1,000.

The new dental hospital and school in Chambers-street, Edinburgh, were inaugurated on Thursday, the 13th inst. The property was acquired for £4,000, and has been remodelled, at a further cost of £2,000, from plans by Messrs. Simon and Tweedie, of Hanover-street, Edinburgh.

The local board of Milnrow, near Rochdale, have adopted a scheme for completing the sewerage of the district prepared by their surveyor, Mr. Charles Rothwell. The estimated cost is £8,400, exclusive of £486 for way-leave, and the length of new sewers will be nearly six miles.

One of the loftiest chimneys in New York State is that erected at the Eastern Power station of the City Railroad Co., situated on the banks of the East River at Brooklyn. It is circular on plan, built of brick, and rises to a height of 296ft., and contains a circular shaft 17ft. in diameter.

WATER SUPPLY AND SANITARY MATTERS.

Chester.—Mr. Clerke, M.Inst.C.E., on behalf of the Local Government Board, held an inquiry at Chester on the 6th inst. as to an application of the corporation for sanction to borrow £25,000 for the installation of the electric light in the city. It is proposed to erect the generating station on Tower Field Gardens, on the west of the Chester and Holyhead Railway embankment, near the Water Tower; and the site chosen for a distributing station is situate at the back of Hamilton-place. Without provision for street lighting the estimated cost of the scheme, which has been formulated by Dr. John Hopkinson, is just under £20,000; with it the estimate will be just over £25,000. The area of supply is the whole of the city of Chester. There was no real opposition.—Mr. Clerke also inquired into the application of the Cheshire county council for sanction to borrow £11,000 for the purpose of acquiring the military portion of Chester Castle, and carrying out certain much-needed improvements in the assize courts; £4,734 is to be paid for the prison, £4,900 for improving the Crown Court, and £1,430 for providing surveyors' and accountants' offices. To this proposal, again, there was no opposition.

Portishead Local Board.—At a special and final sitting of the Portishead Local Board, held on the 11th Dec., the clerk intimated that the formal sanction of the Board of Trade to the construction of the outfall of the proposed sewer on the Crown foreshore lands had been received. The surveyor was instructed to complete the contract drawings, specifications, &c., and advertise for tenders for carrying out the proposed sewerage works. The chairman and members of the board approved a testimonial acknowledging "The thorough and efficient services of the surveyor, Mr. T. J. Moss Flower, since his appointment to the office of surveyor and inspector on the formation of the board"; and bearing testimony "To the ability which Mr. Moss Flower has shown in framing and promoting the sewerage scheme for the urban district of Portishead, which has been approved by the Local Government Board, as well as to the skill and judgment shown by him in the general conduct of his duties." The testimonial was sealed, and signed by all the members present.

Rhyl.—The memorial stones of the sewerage works and marine lake, now being constructed at Rhyl, at a total cost of £250,000, were laid on Friday. The new system of sewerage replaces one reconstructed fifteen years since, at a cost of £14,000; this work, which will cost between £30,000 and £40,000, is now being carried out from designs, and under the superintendence of, Mr. Baldwin Latham. The pumping system has been adopted, providing for a continuous flow of the sewage, and doing away with the difficulties attending the tide-locked system. The sewage of Rhyl will be conveyed by gravitation to a reservoir measuring about 30 yards square, constructed of concrete. Here machinery is provided to raise the normal flow of sewage and storm-water to a high-level reservoir, and the contents will eventually be discharged at a long distance from the shore, and upon the first hour of the receding tide. All the sewer-pipes have been water-tested, so as to guard against contamination of the subsoil. The pumping will be carried on by six gas-engines in duplicate. The contractor is Mr. Jacob Biggs, of Birmingham. The new lake works, of which Mr. Baldwin Latham is also the engineer, consist in the conversion of what was previously known as the Mudland into a marine pleasure lake. The site of this lies between Wellington-road and the Chester and Holyhead Railway. Parallel with the river Clwyd a bank has been formed between the railway viaduct and the Foryd foot-bridge. This embankment is protected from the sea by a stone pitching. The water will be let in at a point near the viaduct, and will be changed at frequent intervals by means of a double outlet culvert which runs through Foryd Bridge embankment. The depth of the water in the lake will only be 4ft., with a depth along the margin of 2ft. In the centre will be an ornamental island of two acres in extent, on which it is proposed to erect refreshment rooms; the island will be laid out with shrubs, trees, and flowers. The lake will have a water surface of about 40 acres. The work will cost about £8,000. The embankment has already been constructed by the contractor, Mr. George Law, and the whole work will be ready for next season.

◆

A mechanics' institute at New Hartley was opened on Saturday. It adjoins the colliery entrance, and consists of a reading-room 27ft. 6in. by 21ft. 6in., a billiard-room of like dimensions, and library 11ft. square. Mr. Ornsby, C.C., was the architect.

The Government have made a grant of £10,000 towards the architectural completion of the University College of Wales, Aberystwith, conditionally upon £5,000 being raised by friends of the institution. The latter sum has been subscribed to within £800.

Our Office Table.

The Home Secretary has appointed Mr. D. Cubitt Nichols, M.S.A., one of the three members of the Tribunal of Appeal constituted under Section 175 of the London Building Act, which comes into force on the 1st prox. The council of the Royal Institute of British Architects have appointed Mr. Arthur Cates, and the council of the Surveyors' Institution their president Mr. T. Chatfeild Clarke. The Home Secretary, pursuant to the provisions of section 179, has fixed the remuneration of each member by way of fees, and according to a scale to be in force for one year only.

The exploration of the site of the recently-discovered Roman villa at Darenth, Kent, referred to in our issue of the 7th inst., p. 808, is still being carried on. The buildings extend far beyond the apparent limits shown by the first diggings. The arrangement of flues remains in many cases in a perfect condition. On the east side is a small room about 12ft. by 7ft., in which the rows of piles, each formed of tiles laid one upon another, are clearly defined. Upon these piles the floor of the room rested. Like many other Roman villas in Britain, this one was provided with glazed windows, and one large pane has been found in addition to many fragments. The large bath, on the west side of the house, is some 3ft. below the general level of the other rooms, and measured originally about 50ft. by 20ft., with a descent of cemented steps at one end. No pavements of ornamental design have yet been found, and only one small bronze plate filled in with coloured enamel, but there are a number of worked objects of deer horn.

The United States Minister in Constantinople, reporting on the exploration of the ruins of Niffer, near ancient Babylon, mentions that the work is undertaken at the cost of the Babylonian Exploration Fund, founded at Philadelphia in 1888. Some 200 Arabs are employed under the direction of Dr. Peters, of the University of Philadelphia, and "in the number of tablets, brick, inscribed vases, and in the value of cuneiform tents found, this American enterprise rivals, if it does not excel, the explorations of Layard at Nineveh and Rassam's excavations at Abu Habba." Dr. Hilpricht, also of the University of Pennsylvania, who was originally connected with the exploration, remains in Constantinople at the request of the Turkish Government, to translate the inscriptions and arrange the tablets and other objects excavated. Many tons of these, including tablets, vases, inscribed brick and sarcophagi, have arrived at the Constantinople Museum, and the Sultan has promised that Pennsylvania shall receive one of all duplicate antiques. So far, 20,000 tablets of clay and stone have been discovered, on which are inscribed promises to pay, deeds, contracts, and records. "About 150 Hebrew, Mandic, Arabic, and Syrian inscribed bowls have been dug up. These are more than all the museums in the world possessed before. They have also found hundreds of Babylonian seal cylinders, and about 1,000 vases of alabaster, marble, and other stone, with votive offerings of lapis lazuli, magnesite, and agate. Many hundred vases, toys, weapons, instruments, and household objects in iron, bronze, and clay were discovered."

The annual examination in sanitation, held under the auspices of the Worshipful Company of Carpenters, took place at Carpenters' Hall on Friday and Saturday last. The number of candidates presenting themselves exceeded that of all previous years, being upwards of 40. This in itself is evidence that the value attaching to the Carpenters' Company's certificates is increasing year by year as the high standard required by the examiners becomes more widely known. That the candidates are not drawn only from London and the home counties is proved by men coming from Staffordshire, the South Coast, and even Scotland to obtain this certificate. The Company have again been fortunate in securing the services of Professors Banister Fletcher, Henry Robinson, T. Roger Smith, Mr. F. C. Penrose, F.R.S., P.R.I.B.A., Dr. Wynter Blyth, and Mr. Ernest Turner to act as examiners. A list of the successful candidates, with the questions set at the examination, will be found in our advertisement columns.

The whole question of how best to protect iron and steel from corrosion in roofs, bridges, pipes, and other constructional work resolves itself, according to the reader of a paper before the American Society of Mechanical Engineers at their Montreal conversazione a fortnight ago, into several "Dont's"—*i.e.*, Don't have any scale on the metal. Don't paint it with anything but pure linseed oil and oxide of lead or graphite paints. Don't forget that frequent inspection and care are very necessary. Don't let the cost and interest accounts be the governing factors in the case of protecting any metal structure on whose continuity and strength human life and safety depend. In comparing the two paints recommended, it was claimed that a properly-made graphite paint should prove more durable and a better protector than oxide of lead. Graphite has a strong affinity for metal surfaces, and even where light colours are desirable, graphite paint should be used as a priming coat. Again, graphite is impervious to the action of heat, cold, sea air, acid or alkali fumes, which are more or less destructive agents to lead paints.

A solution of 50 parts of commercial alizarin in 1,000 parts of water, to which a solution of ammonia has been added, drop by drop, until a perceptible ammonia odour is developed, will give to fir and oak a yellow-brown colour, and to maple a red-brown. If the wood is then treated with a 1 per cent. aqueous barium chloride solution, the first named become brown, and the latter a dark brown. If calcium chloride be used instead of barium chloride, the fir becomes brown, the oak red-brown, and the maple a dark brown. If a 2 per cent. aqueous solution of magnesium sulphate be used, the fir and oak become dark brown, and the maple a dark violet-brown. Alum and aluminum sulphate produce on fir a high red, and on oak and maple a blood-red. Chrome alum colours maple and fir reddish-brown, and oak Havana brown. Manganese sulphate renders fir and maple a dark violet-brown, and oak a dark walnut brown.

CHIPS.

A marble bust of the late Duke Ernest of Saxe-Coburg and Gotha has just been placed in the corridor at Windsor Castle. It has been executed for the Queen by Mr. Glassby.

Memorial tablets have just been erected to Lord Chancellor Campbell and his wife, Baroness Stratheden, in the south aisle of Jedburgh Abbey, near to the vault in which they are interred. Near the top of the tablets are the arms of the two families, and underneath an inscription. The tablets are of a slate-coloured marble, and are the workmanship of Mr. Rhind, sculptor, Edinburgh.

The foundation-stone of a new church at Pontygwaith was laid on the 11th inst. This church is being built at the entire cost of Mrs. Llewellyn, of Baglan, and will seat over 300 persons. Mr. Halliday, of Cardiff, is the architect. Mr. Haines, of the same town, is the contractor.

At the forthcoming great Liberal demonstration at Cardiff, when the Earl of Rosebery will be the chief speaker, a huge temporary building is to be erected in the Cattle Market to hold 10,000 people. The plans have been prepared by Messrs. J. P. Jones, Richards, and Budgen, Cardiff, in consultation with the architects to the National Liberal Federation, Messrs. Harris and Harris, of Birmingham and London.

At the offices of the local board, Moss-lane East, Manchester, on the 13th inst., Colonel J. O. Hasted, R.E., an inspector under the Local Government Board, held an inquiry into the application of the Moss Side Local Board to borrow a sum of £9,140 for works of sewerage and street improvement, the laying-out of a playground, the erection of a destructor, and other purposes. Mr. W. R. Acton, surveyor to the local board, explained the plans for the destructor, which is estimated to cost £4,040. This portion of the scheme was strongly opposed.

The first sod of the new Snowdon Railway was cut on Saturday. This new mountain line starts from Llanberis Station, and is on the London and North-Western Railway system. The line will be five miles in length, and is to be completed in July next. The gauge will be 2ft. 7½in., the curves never being sharper than four chains (264ft.) radius, and the gradients never steeper than 1 in 5½. The Abt system will be adopted in the main. The rack rail between the ordinary rails will be composed of solid double cast-steel cogs. The locomotive will engage two double pinions in the rack, four teeth being thus in gear at the same time. A train will consist of a locomotive and two carriages of the tramway type, and seated for fifty persons. Sir Douglas Fox and Mr. Duncan Fox are the engineers, and Messrs. Holme and King, of Liverpool, are the contractors.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXVII.—No. 2086.

FRIDAY, DECEMBER 28, 1894.

"FOR THE PRESENT DISTRESS."

THE spirit of Webster, the lexicographer, was once announced as being present at a spiritualistic séance. He was asked what he had to communicate, and in reply, the message was rapped out, "It is tite times." Such a statement would be superfluous now. For years past, it has needed no ghost from the grave to tell us that. Agriculture, commerce, and the professions, as we well know, are all in a bad case, not only in England, but on the Continent and in America. The curious thing is, that nobody seems able to say exactly why. If we had had seven years' famine, we could understand it. But food was hardly ever so cheap. Corn gets lower and lower in price, and as for manufactured goods, they are poured in upon us from factories at home and abroad, as if from self-acting machine like the never-ceasing salt-mill at the bottom of the sea. Sixty thousand acres of farming land, it is said, have gone out of cultivation in Essex alone. The labourers who used to be employed on them have left, not—as townsmen used to assure us—because they found country life so dull, but because there was no work for them, and, therefore, no wages. They, and countless thousands like them, have been driven up to London by stress of circumstances, and either remain unemployed or make employment scarcer for others. Mechanics in general are suffering in the same way. The profits of trade have fallen, like the profits of agriculture. When business is bad, building for business purposes soon stops, and architects, contractors, and workmen all feel the difference. Even the lawyers are complaining, for actions are few. People no longer wax fat and kick. If they quarrel, they try to keep out of the courts. They cannot afford bills of costs, and so they settle their differences in humble ways by compromises or arbitration.

This state of things has now lasted long. Young men have grown np, and middle-aged men have grown old, since Mr. Gladstone remarked, in still-remembered words, that trade was "increasing by leaps and bounds." Like vaulting ambition, it seems to have overleaped itself, and to have come down on the other side. No longer now, as some 40 years ago, is England first and the rest nowhere. That was how matters stood in 1851, when the Prince Consort conceived the idea of a Great Exhibition, and the respectable Paxton dreamed of a great greenhouse to put it in. How the papers puffed him up, and how the British public thought him an inspired architect, is a matter of ancient history. The "new style" was supposed to have arrived. Iron and glass were to supersede everything else; and the Crystal Palaces at Sydenham and Muswell Hill were the ultimate outcome of the belief. It would be interesting now to have the opinion of their shareholders about the Paxton style of construction. It answered well, however, for the temporary purpose it was first applied to. The Exhibition of 1851 was a wonderful success. It drew the attention of all the world to England's supremacy in manufacture, and was an unequalled national advertisement. Orders came in from every quarter; and then, by slow degrees, it came to be seen in every quarter that what we could do, other people could do also, if they tried. They did try; they have been trying ever since, and many of them have succeeded. We are being beaten in our own line; and where we are not being beaten, we are closely competed with. Ours was once, so to put it, almost the only shop in the village. Now half the villagers have opened shops of their own; they buy little from us; and they take away the custom of those who would have bought. Where this will end, there is no saying. At present, with nearly all civilised nations in the same line of business, we seem to be approaching a state comparable to that of the Scilly Islanders in the last generation, who, as some facetious traveller affirmed, depended for their livelihood on taking in each other's washing.

We all wish to see the working classes prosperous. But prosperity implies both good wages and constant work. It is not prosperity when work diminishes as wages rise. Now wages have risen so much, or what amounts to the same thing, production has become so much more costly in some trades by reason of strikes, shorter hours, and vexatious regulations, that work in these trades has almost ceased. It has gone from England to the Continent, where hours are longer, and wages are lower. For an instance, look at the plate-glass trade, and ask any large dealer how much British plate is made now. Then, again, work goes abroad because the English workmen cannot, or will not, get out of his groove. He has too often been turned into a machine, and a machine he now wishes to remain. All the preliminary models for one of the most important patents of recent times had to be made in America, because, as the patentee, who is an Englishman, has publicly stated, he could not find men in this country who would take the trouble to prepare them. American workmen, he found, were deeply interested in anything fresh, and entered into it with all their heart and soul; but here men preferred to keep on in the same jog-trot way from infancy to age, and did not want to be bothered with having to think. It is not only the workmen, however, who have no love for new ideas. The manufacturers have minds of the same order. An English chemical factory, say, in the colour business, will retain the services of perhaps one, or two, or three scientific chemists. A German factory of the same rank will employ from 40 to 50; university men, with the very best scientific training. It will provide each of them with his own separate laboratory, fitted with the most perfect appliances; it will leave him free to work, not in routine and drudgery, but in original research for the purposes of the business; and it will give him sufficient inducements to go on making discoveries that may sooner or later be turned to account. This is how it is that the words "made in Germany" on an article are fast becoming a recommendation, and not a reproach. This is how it is, for example, that though England is so rich in the materials from which Portland cement is made, and Germany is so poor in them, yet German cement ranks abroad as of the first quality, and English only as of the second.

These things do not account for the whole of our depression in trade; but they do account for a considerable part of it. Unless England is to be what Holland is, we shall all have to keep down the Dutch part of our nature—the slow, sleepy part of it, which is satisfied with traditional methods, and hates to rouse itself to anything new. In the mean time, we ought to cut our coat according to our cloth. This is not a period for laying needless burdens on anybody. The rich are, in general, not nearly as rich as they were, and the middle classes are verging on poverty. Yet the whole tendency of legislation has lately been to inflict unnecessary and unproductive expense upon them. The enormous cost of our sewer system, with its very unsatisfactory results, is a case in point. But there are many others. We are being more and more forced by legislation to do everything in the most permanent and substantial manner. This is all very well if we can afford it. But in times like these we cannot afford it. They are driving us to ask whether solidity and permanence are really so essential to all sorts of buildings as we have been accustomed to believe. Look at the life-history, as one may term it, of a London street. If it is a street in the City—it is constantly being pulled down and put up again bit by bit. Expensive structures are built—or were till lately built—on leases which had only 15 or 20 years to run, and built, in some cases, with the knowledge that they would certainly be pulled down at the end of the term, to allow an extension of some adjoining property. Is there really any need that such temporary work as this should be done in a style fit to last for centuries? Is it not rather a piece of extravagance for which all of us, in the long run, are directly or indirectly the poorer? And if we look at a street or a square in the suburbs, we shall find that it, too, is in a state of perpetual change. Its buildings, indeed, are not always in process of being demolished. But they are undergoing a constant process of degradation. They begin, perhaps, as detached houses at high rents, with good gardens, and everything handsome about them. Then, as population increases, they are added to and subdivided. The gardens are built on; the houses get closer and closer together. What used to be quiet roads become busy thoroughfares. Here shop-fronts begin to jut out from what were formerly private residences. There, again, in the back streets, the residences are turned into lodging-houses, and the lodging-houses into separate tenements. The first tenants, or the class they belonged to, have gone further out of town, and the neighbourhood has sunk—as the outskirts of towns always tend to sink—to a lower level. When everybody knows this to be the regular course of things, is it worth while to build in a "rising neighbourhood" as if it would still go on rising and never decline or fall?

What is wanted in bad times is that buildings, like other things, should become less and less expensive. But the whole tendency of present-day legislation is to make it more and more so. Cheap building is frowned on everywhere, though cheap building need be neither unsanitary nor inartistic. Some of the most picturesque structures all the world over are the least costly ones. There is more beauty in an old thatched cottage than in a mile of surveyors' architecture, and the more stringent are the rules in any town about matters of construction, the more ugly and more vulgar that town is almost sure to be. We do not advocate temporary work everywhere: we simply counsel a return to the practice of highly civilised nations, like the Greeks, who built temporary structures for everyday purposes, and monumental ones for great national works. If we did not squander so much money on "the vain attempt to give a lasting lot, To things ignoble, born to be forgot," we should have more to spare for those which are really deserving of perpetuity.

There is another tendency of the day which, before long, will be far from making bad times better. It is that of inflicting all sorts of expenses—some necessary, and some needless—on the owners of property, in the cheerful belief that they are rolling in riches, and that they can and will pay out of their own pockets for whatever the Legislature likes to demand from them. At the moment, it may appear as if they would, for the simple reason that housebuilding of late years has been somewhat overdone. But, as architects know, recent legislation is rapidly stopping it. People will not continue to invest their money in housebuilding if housebuilding is going to carry a double share of the national burdens. The consequence is that rents will go up, though it is to the interest of most of us, under present circumstances, that they should rather go down.

Whatever makes buildings dearer to produce, will in the long run make them dearer to hire. House-property, at the best, is a very troublesome and uncertain investment. The percentage it yields is seldom, perhaps, more than half what it seems to yield. Tenancies nowadays are short; vacancies are long; repairs and re-decorations are increasing. Every fresh-comer racks his brains to think what concessions, or additions, or improvements he can screw out of his landlord, and no improvements will keep up the value of property for many years, or arrest the decline of a neighbourhood. And when, on the top of all these vexations, the public takes a fancy to look upon every landlord as a kind of habitual criminal, who is to be subjected to as many artificial pains and penalties as possible, it is only natural that people of moderate capital should grow less and less willing to assume such an unpopular character. Such legislation may be directed only at landlords; but amongst the first people it strikes are architects, contractors, and workmen in the building trades. Nor will it affect them alone. As fewer houses are built, everybody who occupies a house will either have a dearer one or a worse one, or will have his private fads and fancies less attended to than they are at present. If capitalists could be forced by law to build, it might be otherwise; but till then, it would be as well, before putting exceptional burdens on building-owners, to consider whether, as the Americans say, they "will stay put." Unless they do, it were a mere waste of time to take them off one section of the community and lay them on another.

The wise men of Gotham once determined to set up a public swimming-bath. It was a laudable purpose, and the population entered into it heart and soul. Outside the village there was a pond, which only needed to be deepened at one end and made shallower at the other to be the very thing they wanted. Now, the Gothamites always prided themselves on being plain, practical people, who took the most direct and obvious way to whatever they desired. So they all turned out one morning, with pans and pannikins, tubs and pails. All day long they worked at dipping out water from the end they wished to be shallow, and pouring it in at the end they wished to be deep. At sunrise they came for their first bathe. To their amazement, they found the same old pond they began with,—neither deeper nor shallower; and they agreed that witchcraft had undone in the night everything that their industry had accomplished in the day. One is sometimes tempted to believe that the Gothamite is still in the land, and has yet to learn that other things besides water are sure to find their level.

"OLD MASTERS" ON THE CONTINENT.—XIII.

By Charles L. Eastlake

(Keeper of the National Gallery).

AMONG German painters whose lives extended from the 15th to the 16th century the name of Matthäus Grünewald is in this country comparatively unknown. The contemporary of Holbein, of Dürer, and the elder Cranach, he failed to achieve such a reputation as, through the number or excellence of their works, has preserved the memory of his more distinguished compatriots and fellow artists. Of his life and professional career little or nothing is known. Even the dates of his birth and death are doubtful. Sandrart, writing in the 17th century, gives us no biographical details respecting him beyond the facts that he resided, chiefly at Mayence, in seclusion, and that he had made an unhappy marriage. Yet the old author must have held Grünewald's abilities in high estimation, for he refers to him as a most distinguished painter, and describes him as the "Correggio of Germany."

According to some writers, Grünewald was born at Frankfort, while others believe that Aschaffenburg was his native place. It is certain that he settled for some time of his life at the last-mentioned town, where he came under the patronage of Cardinal Albrecht, Archbishop of Mayence.

The authenticated works of this painter are not numerous, and considerable difference of opinion prevails respecting some which were formerly associated with his name. A portrait of the Emperor Charles V., formerly in the Belvidere Collection at Vienna, and now transferred to the new museum in that city, is doubtfully ascribed to Grünewald. In the Frankfort Gallery, two wings of an altarpiece bear his monogram. They are executed in grisaille, and represent figures of St. Lawrence and St. Cyriacus. Characteristic as these are of Grünewald's style, they are exceeded in importance by a shrine which he painted early in the 16th century for the high altar of a church at Isenheim. This interesting work is now deposited in the Museum at Colmar. The shrine was inclosed by double doors, each painted on both sides. The innermost pictures illustrate the Life of St. Anthony. Externally, the shutters present a composition representing Madonna with the Infant Christ in her arms seated before a beautiful landscape above which Heaven seems to open, and a host of angioletti descend in a glory to pay their homage. On the inside of the outer wings are depicted the Annunciation and the Resurrection. On two of the side panels appear figures of St. Anthony and St. Sebastian, each standing on a small but richly-carved pedestal, and each lighted by a window in the background. There seems to be no doubt that all the above-mentioned paintings are the work of Matthäus Grünewald; but a Crucifixion painted on the exterior of the shrine differs so much from the rest in sentiment and technique that critics do not assign it wholly to the painter's hand.

Another notable picture by this master is the group of St. Maurice and St. Erasmus, now in the Alte Pinakothek at Munich, which has been selected for illustration with this article. According to tradition, the Emperor Maximin in the second century summoned his Theban legion from the East to reinforce an army which he proposed to lead into Gaul. This legion was commanded by a Christian officer who, when the army halted near the Lake of Geneva, refused to participate in some idolatrous rites, which had been ordered by the Emperor, and, in consequence, was martyred, together with his faithful followers.

Whether in allusion to his name, or because he was supposed to have been born in Africa, St. Maurice in old German art is sometimes represented as a Moor, and Grünewald has followed this custom in his picture. The swarthy saint is clad in steel armour, damascened with gold and enriched with jewels. On his head is a chaplet of gold and gems. His left hand rests on his sword, and he extends his right towards St. Erasmus, who stands near him in episcopal vestments. The bishop wears a large white and gold mitre, and a cope of gold brocade over a richly-coloured robe and white surplice. In one hand is a crozier of elaborate design and workmanship: in the other he bears the emblem of his martyrdom. Behind the two saints are seen a priest and a soldier, the latter—one of St. Maurice's Legion—is of dark complexion, like his master, and quaintly attired; in the background hangs a green curtain.

The realistic detail of ecclesiastical costume and Mediæval armour would always make this picture interesting. It is true that the principal figures, which exceed the size of life, are ill-proportioned, and somewhat ungainly in pose; but in German art of this period, a sense of grace and physical beauty seldom found expression. The works of Matthäus Grünewald occupy a middle place between the old archaic style of painters who preceded him and the more naturalistic school which followed his period. Without possessing the genius and originality of Dürer, or the exquisite skill of Holbein, he seems to have been one of the first artists of his country who broke away from traditional conventionalities, and endeavoured to interpret nature truthfully, with due regard to the actual conditions of light and shade, gradation of colour, and fidelity of effect. In the work which has just been described, these peculiar characteristics are not prominent. But, even here, a comparison of the altar-piece itself, with the wings believed to have been painted by Lucas Cranach, with representations of St. Mary Magdalene, St. Chrysostom, St. Martha and Lazarus, enable an experienced eye to judge in what respect Grünewald differed from his contemporaries, and maintained his individuality.

SANCTA SOPHIA, CONSTANTINOPLE.*

THE interesting volume on this famous church, which has been produced jointly by Mr. W. R. Lethaby and Mr. Harold Swainson, will be valued by all students of the Byzantine architecture. The authors have entered into the subject of their labours with untiring industry and zeal. Mr. Lethaby and his coadjutor have wrought their versatile knowledge and pencil into the service of describing and critically examining this most wonderful of the edifices reared since the Parthenon. When Justinian completed this great church after the destruction by fire of the original building of Constantine, he is said to have exclaimed, "I have surpassed thee, O Solomon!" But, as Fergusson remarks, Justinian's great work was much larger, and covered ten times the area of the Jewish Temple. Its fame as a great architectural triumph has called out the panegyrics of great historians and poets, including our own Gibbon, whose eloquent and classical description of Sta. Sophia is probably known to most readers. Messrs. Lethaby and Swainson observe, their "first object has been to attempt some disentanglement of the history of the church, and an analysis of its design and construction; on the one hand we have been led a step or two into the labyrinth of Constantinopolitan topography; on the other, we have thought that the great church offers the best point of view for the observation of the Byzantine theory of building." As far as we can judge from a cursory glance of the volume, the authors have done something to clear the early history of this marvellous building from certain doubts and myths. The translation of historical documents and records has been the work of Mr. Swainson, whose literary acumen and learning have been of undoubted value to the work.

The first and second churches of Sta. Sophia are discussed in the first chapter, upon indubitable authorities, whose names appear as foot-notes. Among them we see a reference to Zosimus, whose description of ancient Byzantium and its reconstruction under Constantine was written about a century after the event. This ancient writer describes the city as lying upon the crest of a hill, part of the isthmus that is made by what is called the "Horn" and the "Propontis"; also the circular forum, and alludes to the enlargement. Dr. Mordtmann, another recent writer, has thrown much light on the extent of the city and its buildings. It was in 328 that Helena is said to have discovered the true cross and other relics at Jerusalem, and this event seems to synchronise with Con-

---

* The Church of Sancta Sophia, Constantinople. By W. R. Lethaby and Harold Swainson. London: Macmillan and Co.

stantine's choice of Byzantium. It has been generally conceded by all historians, Theophanes, Glycas, Callistus, and others, that Constantine founded the first church dedicated to the Second Person of the Trinity as the Divine Wisdom. This church was destroyed by fire. That the present Sta. Sophia occupies the site of the first church has been questioned. The authors think it does. The first edifice was of medium size, and had its entrance at the east, the sanctuary end of the present, which is about 250ft. in length. The pre-Justinian church was burnt on the 15th January, 532, and the reconstruction commenced on the 23rd of the following month, according to Zonaras. Theophanes says the work took five years eleven months and ten days in building. An earthquake destroyed a great portion of it in the 32nd year of Justinian's reign. The fall of the dome by earthquake took place in 558; but it was restored and again consecrated five years afterwards by Eutychius. Theophanes describes the emperor and patriarch riding together, and bearing the Gospel with them, while the people chanted "Lift up Your Gates." Among contemporary descriptions of this church after restoration the poem of Paul the Silentiary is the most important. The poem begins with a eulogy on the emperor, and is in long Homeric hexameters. Every part of the church is described in the poem in gorgeous imagery—the apse and exedras, apse bema, exedras semidome, narthex, the four piers and pendentives, the dome, the marbles, &c. The Silentiary's poem is given in full in the third and fourth chapters. The ambo, one of the chief features, is particularly described. Minute and interesting details are furnished on the ritual arrangements, and interior parts, into which we cannot here enter. The writings of Du Cange, in his commentary on the Silentiary's poem, has been used, and this chapter is probably the most interesting to the ecclesiologist. In Justinian's time the number of clergy were 525, but it was increased in the age of Heraclius to 600. The ritual of the services, as that of the celebration of the Mass, the Adoration of the Cross, is fully described. The next chapters refer to relics, treasure, and lighting. A very beautiful-gemmed processional cross is illustrated, having a swinging fringe below the arm of cross. Also a few very unique examples of lamps and coronæ, one of which is the polycandelon or disc for 17 lamps in the British Museum, and a Coptic polycandelon for four lamps of handsome design, brought from Egypt by Professor Flinders Petrie. Chapter X., on "Building forms and the Builders," is a dissertation on the growth of Byzantine architecture. Here Mr. Lethaby descants on the many beauties of this building, as illustrating the development of the style, which was chiefly one of brick used in the finest manner, especially in domical vaulting. M. Choisy has shown that the builders constructed their vaults without centres, and that the method is not derived from a Roman source, but is Asiatic—"the Greek spirit working on Asiatic elements," and this is true enough. Justinian's great work was essentially Greek in feeling and conception. The pendentive dome is certainly of Eastern origin, as Fergusson and others have shown clearly. The remarks on the original form of the church, illustrated by sketches and diagrams of the plan and vaults, generally bear out Choisy's theory. A high tribute is bestowed on *L'Art de Bâtir* for its clearness and freshness of sight and logic. We have no space now to enter into the interesting question of the lines of construction and curvature of the Byzantine vaults which is here discussed. The very beautiful gradation in the intersection of the vaults is pointed out. M. Choisy's method is to make the curve of intersection over the diagonal in plan a segment, all smaller sections of which are segments of circles; but Mr. Lethaby points out another, and perhaps truer method, in which the vault surfaces gave the conditions of the problem, the intersections finding themselves. Several illustrations in the text are here given. In a work of this pretension we might have looked for better illustrations and views; but the authors have chiefly confined their labours to a descriptive and critical examination of this great edifice of Mediæval Greek architecture.

DESIGNING OF STEEL BRIDGES, THEORETICAL AND PRACTICAL.—XII.

When the span of a bridge girder exceeds eighty, or for a maximum, one hundred feet, the bearing area is increased *pro ratâ*, and the friction between the surfaces of the bed-plates becomes correspondingly augmented, in spite of all efforts to adequately maintain the lubrication of the sliding parts in contact. With the increase in the length of the girder, the expansion or elongation of it similarly becomes greater, and experience has demonstrated that at this point, the sliding surfaces must be abandoned, and preference given to one or other of the more delicate adjustments, now in use among engineers and bridge builders, in examples of bridges of large span. Among the earliest of these is the plain roller method with upper and lower bed-plates, which is still a good deal used. Before, however, adverting to the practical details of the construction and working of this adjusting arrangement, it is necessary to inquire a little into the theoretical conditions which govern its application. It is no longer a question of the contact of one surface upon another, as in the case of sliding plates, but one of the contact of a bearing surface, presumably horizontal, upon a given number of cylindrical rollers, which to some extent complicates the relations between the parts touching one another. It is well known that theoretically, circles are supposed to touch one another, or other bodies situated in one plane, at a single point, in the same cross section of the cylindrical mass. There is no doubt, however, in practice that the actual area of contact which depends upon the amount of pressure or impact exerted upon the cylinder or sphere, the nature of the material, and the limit of its elastic resistance, is of considerably larger dimensions than those of a mere spot. If we take a ball—a billiard ball will serve as an illustration—and allow it to fall upon a hard even surface, covered where required, with a wet coat of coloured paint, a spot of a very appreciable size will be found on the ball, clearly indicating that the force of impact caused the ivory ball to become, to a certain extent, flattened by the contact. In all probability, a very similar result attends the application of heavy impactive loads rapidly traversing the bearings of the girders, with respect to the rollers, which, besides their rotary motion, have to transmit the whole load live and dead to the supports. As the rollers are continuously supported throughout their entire length, and subjected to a uniformly vertical pressure, their is no question of any stress arising from leverage. The right proportions for the diameter of the expansion rollers of bridge girders were not arrived at until practice and experience had pointed out the many disadvantages which resulted from their being made a great deal too small, as they generally were, when first introduced. As a consequence dirt found its way into the roller frames, and as there were no means of cleaning them, they soon rusted and became completely jammed. Examples of rollers being thus rendered useless, have occurred in numerous localities. Among others, at Birmingham, Liverpool, Exeter, Hammersmith, and at the Boyne railway bridge in Ireland. When once the main girders were adjusted on their bearings, the bed-plates, rollers, and all other parts of the adjusting arrangement were frequently bricked up or otherwise concealed from view. They might be occasionally oiled or lubricated in some desultory sort of manner; but usually no notice was taken of them until the state of the abutments or piers upon which they rested but too plainly indicated that the bearings required attention.

FIG. 1.

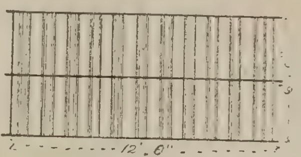

FIG. 2.

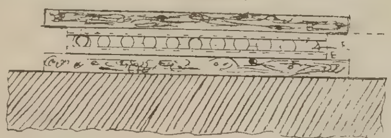

FIG. 3.

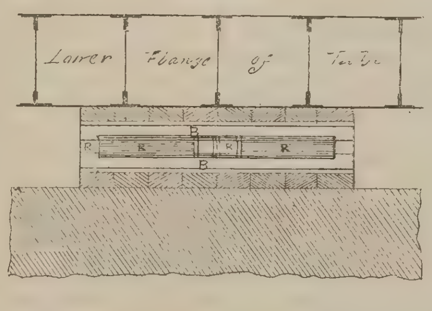

FIG. 2a.

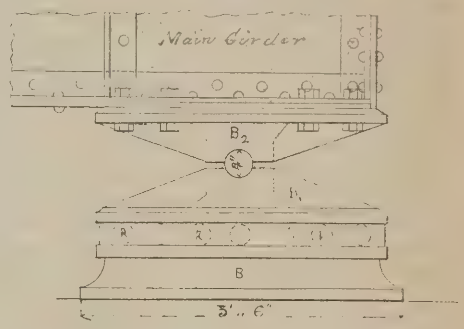

In countries where the extremes of temperature are not very widely apart, the actual amount of the expansion of bridge girders agrees fairly well with that ascertained by calculation. In the case of the Britannia bridge a very close result was obtained. The main spans of the Britannia bridge were, previously to being fixed *in situ*, temporarily supported on a bed of hard wood resting upon stone supports specially constructed for their reception. In this position, the area of each bearing was 120sq.ft., and the load upon it amounted to 630 tons, or exactly 5¼ tons per unit of area. Over the land towers, the expansion and contraction at the bearings of the great tubes is arranged as shown in cross section in Fig. 3. Upon the solid masonry is laid a timber platform of creosoted pine 12ft. by 6ft., and 3½in. thickness, which carries a cast-iron bed-

FIG. 3a.

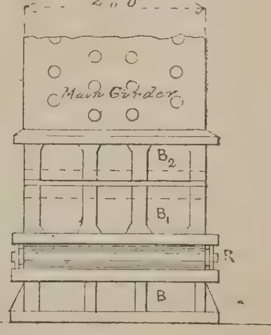

plate B of the same superficial dimensions. Twenty-two cast-iron rollers 6in. in diameter, but only half the width of the bed-plates, and therefore set in a double frame. Figs. 1 and 3 are free to revolve between the lower and the upper bed-plate B which rests upon them. On the upper surface of the top bed-plate, another platform of creosoted pine is laid, and a thick *couche* of lead putty insured a perfectly uniform bearing. It is worthy of notice, as evincing a condition which has no relevance to any other type of bridge of construction: that the temperatures of the interior and exterior of the tubes vary very considerably. The range in the interior is from 26° to 76° Fahr., while over 120° has been registered with the sun shining on the outer surface. While, therefore, plate and open web girders are more exposed to the direct action of changes in temperature, they, and especially those belonging to the former class, are not exempted from lateral expansion, which assumes the form of a slight bend or warp.

In actual practice various rules have been given by engineers for the safe working load on rollers, depending to some extent upon the nature of the load brought upon them, as well as upon its actual intensity. These are, as might be expected, all functions of the diameter of the roller. If a bridge be exposed to the continual repetition of heavy loads, whether at a moderate or high rate of velocity, it is advisable to take a lower value for the safe working load upon the rollers, than in the example of structures of a slighter construction. Let P equal total safe load in tons, d the diameter in inches, and L the length of the roller also in inches, then we have for the heavily loaded bridge—

$$P = L \times \sqrt{d} \times 0{\cdot}26 \quad \ldots\ldots\ldots\ldots (1)$$

and for the lighter—

$$P = L \times \sqrt{d} \times 0{\cdot}32 \quad \ldots\ldots\ldots\ldots (2)$$

These formulæ will not strictly apply to rollers whose diameters are less than two inches, and as a matter of practice, it is better never to adopt a smaller diameter. For diameters not exceeding four, and less than two inches, the equations (1-2) may be written, using the same notation—

$$P = L \times \sqrt{d} \times 0{\cdot}53$$

The use of rollers bound together in frames and placed between an upper and lower bed-plate, somewhat resembling a pair of parallel jaws, as shown in Figs. 1, 2, and 3, has been in the more modern days of bridge building, improved by the addition of a pivot or hinge fixed underneath the mass centre of the bearing area of the girders. This arrangement is represented in Figs. 2^a and 3^a, and is clearly of a more intricate and complicated character, both as regards the number of its component parts and details of self adjustment than those already described and illustrated. Upon the support is bolted or fixed down by any convenient method the lower cast steel bed-plate B, Figs. 2^a and 3^a, and upon its planed surface the steel rollers R R are free to move together within their frame. An upper bed-plate, B_1, transmits the actual load uniformly over the separate rollers. In the central part of this bed-plate B_1 there is a circular socket provided, which receives the lower half of a turned steel pin 4in. in diameter. Resting upon the upper half of the pin is a third bed-plate B_2, which is bolted to the lower boom of the main girder. It will be thus seen that the steel pin has to bear the whole of the load upon one end of the main girder, which is however, brought upon it in a somewhat different manner to that which obtains with respect to the rollers R R between the bed-plates B and B_1. The area of contact between the plate B_1 and the circumference of the rollers is practically small, but in the case of the pin, is comparatively large, since the bearing of the socket of the upper plate B_2, which is precisely similar to its other half, B_1, as it might be termed, extends nearly over its semicircumference. At the other or fixed end of the main girder in Figs. 2^a and 3^a, the steel pin is also used; but the rollers are dispensed with, and consequently there are only a pair of saddles or bed-plates, the lower of which is securely and permanently bolted down to the abutment.

The pressure brought upon any cross section or linear unit of a roller must be such as not to incur any risk of permanent deformation or to give rise to any degree of "permanent set." It must be kept well within the working factor of safety of the limits of elasticity of the material. In fact any temporary deflection or flattening at either the upper or lower surface must be of a very slight amount. It must be borne in mind, that even in girders of very large span, not only is the absolute rotary motion of the rollers very slight, but they are under the great disadvantage of being subjected to a very serious load. In other words, they turn under a very large pressure, which for want of uniformity, a by no means unusual attendant upon rough and ready work, might gravely interfere with, and impair the expansive adjustment of the whole system. It is quite possible to imagine the flattening, that is the unit area of contact, so extended as to cause the roller to be unable to turn, and if this should happen with only one roller, it would be quite sufficient to stop the whole motion of the others, and thus jam up and render useless the contents of the whole roller frame, together with saddles, pivots, or bed-plates.

It is evident, from what has been stated respecting the exceedingly small amount of motion imparted to the rollers, that even when they were restricted to the limits we have already assigned to girders of large span, but a comparatively small part of their whole circumference ever came into contact with either the upper or lower saddles. From this the corollary was apparent, which led to the conclusion, that the sides or vertical part of the circumference—to use an expression which will distinguish those parts of the roller in contact with the saddles, and those which are not—were of little or no use. It has therefore been proposed to do away with the sides of the roller, and employ a rocker in its place, and as we shall point out, the rocker, which represents the most modern or *fin de siècle* arrangement for the longitudinal expansion of girders, is really nothing more than an evolution from the roller. For reasons we shall adduce we are very doubtful whether, with the exception of an almost inappreciable saving in metal and length of frame and bed-plate, there is any valid reason for substituting the rocker for the roller. As will be seen from Figs. 4^a and 5^a, the movement of the rockers, or the rollers, as the old name is used still for the latest innovation, resembles a great deal more the throw of an eccentric on a crankshaft than the regular rotary motion of a completely spherical body.

FIG. 4^a.

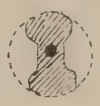

FIG. 5^a.

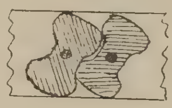

Let the dotted circle in Fig 4^a represent the elevation of an ordinary expansion roller, the size of which is of no moment, as we are at present investigating only a general development of a previous form. While preserving the diameter, that is the depth of the roller when in its normal position, which is one of perpendicularity to the bearing area of the principal girders, the same dimension becomes considerably reduced in a plane at right angles to the former. In Fig. 4^a the shaded portion shows the evoluted rocker, which has very much the appearance of a double T-headed rail, except that the radius of the upper and lower table portions are far too sharp, and the thickness of the middle or web part a great deal too much. It is not necessary, nor can we spare the space, to reproduce the pivot or saddles which are connected with a system of rockers. They are substantially the same as those shown in Figs. 2^a and 3^a. It will be seen from these illustrations and those in Figs. 4^a and 5^a, that while the rollers rotate round a fixed axis, and that their revolutions could be continued until a far greater amount of expansion or contraction was provided for than could ever be required, the rockers, Figs. 4^a and 5^a do not rotate, but simply swivel or steer round their axles. They thus clearly have a certain amount of "throw" right and left, which must necessarily coincide with the maximum elongation or shortening of the girders of the bridge. It is doubtful when the rockers "lock up," as shown in Fig. 5^a, whether there is not a greater liability for them to become jammed and thrown out of use than what is incurred by the older full cylindrical pattern. The nicer and more delicate the arrangement for theoretically determining, and presumably fixing, the lines of the forces or stresses acting upon any part or parts of an architectural or engineering structure, the greater the probability of those forces and stresses following the directions rigidly delineated for them. At the same time, this fixation of moments is attended by an enormous concentration of both load and stress, which unquestionably very severely strains parts of a bridge girder or roof truss, which under different conditions of design and construction might be far less heavily taxed. Local stresses of a violent and "per saltum" character are to be avoided in the designs of all structures, and although we are long past the age of the old cast-iron girders, both of the Warren and the disproportionate flange types, yet the lesson their failures taught us are not to be lightly disregarded, because we now design better, construct better, and have a better and more reliable material at our disposal.

NEW INFIRMARY, SELLY OAK, FOR THE KING'S NORTON UNION.

THESE new buildings are to be erected at Selly Oak, near Birmingham, on land adjoining the present workhouse, for the accommodation of 262 patients, from the designs of Mr. Daniel Arkell, architect, Birmingham, whose plans were selected in the recent competition. The style may be characterised as a free treatment of Queen Anne, and the elevations are to be built in red brick, with Codsall stone dressings. The roofs will be covered with red Broseley tiles. The building is to be in five main blocks, and built fireproof, and consists of male and female pavilions with lying-in ward running north and south, the administrative department being in the centre, thus dividing the male from the female side of the infirmary, all being connected by a wide main corridor, open verandahs at the ends of the pavilions giving a picturesque effect to the structure. On each side of the administrative department are provided receiving wards, one for males and one for females; also spacious staircases, with lifts to carry patients from ground to first floor. The floors throughout the building are of polished oak on concrete, supported by rolled-steel girders. Hydrants will be fixed in the corridors in case of fire. The guardians have accepted the tender of Mr. J. Rowbotham, builder, of Small Heath, Birmingham, at £17,987, for the erection of the new buildings. The works are to be commenced immediately.

BRITISH BUILDING STONES.—XVI.

BEFORE leaving the London clay, some reference to its chemical composition is necessary, for other important deposits, such as the Weald and Oxford clays, have the same substance as a base common to all, the variations being produced by the addition of iron, potash, soda, magnesia, and other substances. These, however, in true clays seldom make up more than one-fifth the entire mass. When clay is mixed with a large quantity of sand it is "loam," when the addition is lime it is "marl." Clay, then, generally consists of at least three-fourths hydrated aluminium silicate. This compound substance constitutes the entire bulk of a pure clay, such as kaolin, and it is represented by the formula $Al_2O_3.2SiO_2 + 2H_2O$. What does this formidable array of letters and figures mean? As these papers are written solely with the object of making the composition of building stones quite plain to the readers of the BUILDING NEWS who are not chemists, an explanation of this formula become imperative. On referring back to "British Building Stones.—IV." already published in this journal, it will be found that Al_2O_3 represents alumina, SiO_2 silica, and H_2O water. It is also stated that alumina is a compound of aluminium and oxygen, silica a compound of silicon and oxygen, and water a compound of hydrogen and oxygen. Clay is therefore composed of oxygen, aluminium, silicon, and hydrogen. All these are simple substances, or chemical "elements," which means that by no process known at present can they be broken up into other substances. Aluminium is a tin-white metal as hard as silver, and only about one-fourth its weight. It enters into combination with oxygen to form alumina, which, in chemist's shorthand, is expressed by the symbols Al_2O_3, the first set of figures in the imposing formula given above. Aluminium is never found "native," or "isolated" in nature, but always in combination with other substances; and it was only as recently as 1827 that the metal was first produced in a pure state. Its compound with oxygen, "alumina," is, however, found in the form of "corundum," of which there

Birmingham

are several varieties. The precious stones—ruby, sapphire, topaz, and emerald are all crystallised forms of alumina coloured by metallic oxides, and in this state alumina is second in hardness only to the diamond. Emery powder is crystallised alumina blackened by admixture with magnesite. It may be asked what conceivable connection there is between the metal aluminium now so commonly used for small picture-frames and other fancy articles, and the colourless hexagonal crystal known as corundum? Just this: that the chemist can take the corundum crystal and break it up into two substances—one the white metal referred to, and the other oxygen. This disposes of the first ingredient in clay. The next to be considered, silicon, is a very common substance, and one which makes up one third by weight of all known rocks. It is never found isolated, but always in combination with oxygen. It is then called silica, or silicon dioxide, with the formula SiO_2. When it is said that silicon makes up a third of all rocks, it is not meant that every rock contains this proportion of that substance; but that if the 25 miles thick of rocks which go to make up the earth's solid crust had all their silicon extracted, then their weight would be decreased one-third. Chemists tell us that aluminium is a metal, and they tell us what silicon is not, for they call it a non-metal. All substances in the universe—that is, elementary or simple substances—are now divided into "metals" and non-metals only. The latter are sometimes called metalloids. The term "gas" used to be applied to some of them; but as the word "gas" does not convey any idea of the properties of the substance so called, but merely states what its condition is at ordinary temperatures, the use of this name is now abandoned by chemists as being valueless, except to describe matter in that condition when its molecules are moving with great velocity amongst one another and frequently "colliding." Silicon is a non-metal, and when isolated—that is, made to stand alone—and few elementary substances can stand alone without the aid of oxygen—it is a brown amorphous powder, which burns readily in the air on being heated, and forms silica (SiO_2). The finest crystals of silica are produced in Nature's laboratory: these are known as "quartz." When ground down, broken, and rolled by running water into grains more or less fine, the result is sand, and this, when deposited in seas or lakes, and hardened by pressure or the infiltration of some cementing substance such as ferric oxide, is called "sandstone." On referring back to the Building News Quarry List No. 374, it will be seen what an important part silica or quartz plays in the building up of some stones; for it is stated there that 98 parts in every 100 by weight of Craigleith stone are pure quartz. This disposes of two of the constituent substances of clay, and the third will now be considered—viz., water (H_2O). The reader may probably say, "Everyone knows all about water; why take up time describing what is so well known?" Yet, at the risk of telling some readers what they may already know, a few facts about this very common substance will be given here. Pure water is never found in nature, and even when produced in the laboratory by distillation it is only relatively pure. Water, invariably found with other substances in solution, is at ordinary temperature a liquid, at 32° Fahr. a solid, and above 212° F. a gas known as steam. The temperatures spoken of here are those of "Fahrenheit's" scale, indicated by "Fahr."; for in many works on chemistry other scales, such as "Centigrade," indicated by "C.," and "Réaumur," indicated by "R.," are used. Centigrade has its freezing-point at 0, and so has Réaumur; both, therefore, correspond with the 32° of Fahrenheit. The boiling-point of Centigrade is 100°, that of Réaumur 80°; these correspond with the 212° of Fahrenheit's scale. It is, therefore, necessary, when temperatures are mentioned, to indicate what scale they are measured by, and authors very often, unfortunately, forget this. So far, then, water is found as a solid, a liquid, and a gas, its condition being determined by the amount of heat or energy it contains. Now, the heat of boiling water is often spoken of as something fixed and definite; but how few really know that water may be made to boil at all temperatures from 32° Fahr. upwards by reducing or increasing the pressure on its surface? As long as water is boiled in an open vessel at about the level of the sea, its temperature continues at 212° Fahr., no matter what heat is placed under it! Water placed in the receiver of an air-pump will, when the air is exhausted, boil violently at 33° Fahr., and continue boiling until the surface is frozen over. Boiling, then, is merely a rapid reduction of any liquid to a vapour, taking place at all temperature when the vapour from that liquid exerts a pressure greater than the atmosphere, or whatever external pressure the liquid may be subjected to at the time. Ordinary atmospheric pressure in these islands at the level of the sea is $14\frac{3}{4}$lb. to the square inch. To overcome this pressure, and thus make water to boil, sufficient heat must be imparted to it, and the quantity so imparted is represented by 212° in Fahrenheit's scale. The temperature of boiling water, therefore, in an open vessel depends on atmospheric pressure, and this depends on the elevation of the place above the sea-level. At Quito, in South America, which is 9,540ft. above the sea-level, atmospheric pressure is so reduced that water boils at 194° Fahr., no matter how fierce a fire is made under it. An important property of water is its sudden expansion in freezing. When the temperature of water at the freezing point (32° Fahr.) is raised, the water contracts, and continues to contract until 39·1° Fahr. are reached, or 7·1° Fahr. above freezing. This is "the temperature of maximum density," above this point, water expands until at 46° Fahr. it regains its volume at the freezing point; thence it continues to expand with a rise of temperature. A cube foot of water at 32° Fahr. weighs 62·418lb., at 39·1° Fahr. 62·425lb., and at 212° Fahr. 59·64lb. Water is the only liquid which has a point of maximum density higher than the freezing point; it increases its bulk by $\frac{1}{11}$th in freezing, and it does so with irresistible force. So far the physical properties of water have been examined; but the most important—viz., the chemical have now to be considered. If wires from the positive and negative poles, the carbon and zinc of any ordinary battery, are dropped into a vessel of water, to which a little salt has been added, bubbles of gas will pass upwards through the water from the end of each wire; if this process is continued all the water will, in course of time, be converted into gas. It is found that oxygen gas rises from the positive pole, and hydrogen from the negative pole of the battery. It is also found that the gases are disengaged in the proportion of one volume of oxygen to two volumes of hydrogen. The gases thus separated may be again made to combine to form water by passing an electric spark through them, and so water can be separated into its two constituent gases, and these again be made to combine to form water as often as may be desired. The power of water as a solvent is another important property to be considered here, as it affects most directly the composition of all rocks. Sugar and salt may be dissolved in water, and though no filter will remove these from the water, yet they are not chemically combined with it. Similarly, water will dissolve iron and other metals in course of time. A wrought-iron bolt $\frac{1}{2}$in. dia., removed from a gutter of the conservatory which stood behind the Albert Hall, Kensington, was found dissolved away by rain-water, the head and nut remaining the original size, whilst the bolt itself was reduced to a wire not more than $\frac{3}{16}$in. thick. Water holds almost every conceivable substance in solution, and unless substances exist in a state of mechanical division or suspension, they cannot be removed by any ordinary filter. This water, absolutely pure to the eye, may contain carbon, magnesia, iron, lime, sulphur, and various other substances in solution, and which can only be detected and removed by chemical analysis. Water takes up and dissolves only a fixed quantity of any substance at certain temperatures. For instance, 100 parts of water at 60° Fahr. will dissolve and hold a solution about $\frac{1}{700}$th part of lime; but if the water is raised to boiling heat, it can hold only little more than half the quantity in solution. Consequently, when water holding lime in solution, such as clear sparkling water pumped from wells in the chalk, is supplied to kitchen-range boilers, the latter, with the pipe leading from them, will become furred up or choked with a deposit of calcium carbonate. The exact quantity of lime held in solution by water at 60° Fahr. is ·1368 parts in 100, and by water at 212° Fahr. ·0752 parts. Water at 32° Fahr. dissolves 1·7967 volumes of carbon dioxide, and at 60° 1·0020 volumes. Many substances which are practically insoluble in pure water dissolve in water with an excess of carbon dioxide (carbonic acid). The calcium, magnesium, and ferric carbonates are attacked and dissolved in this way. Pure ammonia, a colourless compound of hydrogen and nitrogen (NH_3) is very soluble in water, and in this state is sold as liquor ammoniæ, generally of ·880 specific gravity. It contains 27·3 grains of ammonia in a hundred of the liquid, boils at 62 Fahr., and contains 382 volumes of the gas in one volume of the solution. The liquor ammoniæ is used for fumigating oak. There is no law regulating the solubility of any substance in water, and as this cannot be calculated beforehand, it must be ascertained empirically in every case. Water was found to be a compound of oxygen and hydrogen. What are these substances? Taking oxygen first, it is the most widely diffused element in the world, one-half the entire solid crust of the earth being oxygen. Water contains 90 per cent. by weight, and the atmosphere 20 per cent. of it. In water the oxygen is in combination with the hydrogen; in the atmosphere it is not in combination with its nitrogen—it is mixed only. As a gas, oxygen is colourless, tasteless, and inodorous. It is that substance in the air which supports combustion, the chief value of the other constituent being to dilute it. In pure oxygen, substances burn with greater brilliancy, and more rapidly than in the air; iron wire, watch-spring, and even nails all burn with great rapidity and brilliancy in it. Oxygen combines with all the other elements except one—fluorine—to form substances called "oxides." Ozone is oxygen in an altered and allotropic condition—a change brought about by passing silent electric discharges through the dry gas. It is thought that this has the effect of condensing the gas, as three volumes of it are converted into two volumes of ozone. This latter is remarkable for its peculiar smell—hence the name. The remaining element to be considered—viz., hydrogen, also a gas at ordinary temperatures—is the lightest substance known. It is, like oxygen, colourless, tasteless, and inodorous. Unlike oxygen, it is inflammable, and when burnt in the air it combines with the oxygen to form water. Though hydrogen is inflammable, it does not support combustion, and if men could breathe in a gas-holder filled with this gas, they could safely use naked lights in it, as the gas could not burn without oxygen. This at first sight seems strange; but a little consideration will show that this is so, for if hydrogen gas burned of itself without oxygen, when a lighted taper is applied to a gas-burner the flame would travel along the pipes to the holder. If by any means air got into the gas-holder, and this mixture of air and gas was supplied to a gas-burner, then the instant a light was applied the flame would flash along the pipes to the holder, and cause an explosion which would shatter it to pieces. Coal-gas is not pure hydrogen; the flame of this would be quite invisible. About one-half coal-gas is hydrogen, and the remaining half marsh-gas, with carbon monoxide and olefines. Returning to the formula representing kaolin or pure clay, it is seen that four *elementary* substances enter into its composition. Chemists know of about 64 such substances, and these, singly and in combination, go to make up every substance in the known universe. These 64 substances are called "elements," for they cannot be broken up into any other substances. Many of them are only chemical curiosities. Eleven of them go to make up 99 parts in every 100 of all known rocks. These "elements" are here set down with their "symbols" and "atomic weights." (1) Oxygen, O = 16; (2) Silicon, Si = 28; (3) Aluminium, Al = 10; (4) Calcium, Ca = 40; (5) Magnesium, Mg = 24; (6) Sodium, Na = 23; (7) Potassium, K = 39; (8) Carbon, C = 12; (9) Iron, Fe = 56; (10) Sulphur, S = 32; and (11) Chlorine, Cl = 35·5 nearly. The first three elements already described—viz., oxygen, silicon, and aluminium—make up 85 parts in 100 of all the rocks; none of the remaining eight make up as much as 5 parts. Of the others, Nos. 4, 5, 6, 7, and 9 are metals solid at ordinary temperatures, and Nos. 8, 10, and 11 are non-metals solid at ordinary temperatures, except the last, chlorine, which is a gas under similar conditions. Oxygen (No. 1) combines in turn directly with all the others, except chlorine, and this combines with all to form "chlorides." Calcium (4) is a yellow metal, harder than lead, ductile, malleable, tarnishing in moist air (that is, it rusts or oxidises), decomposes water, and, when heated, burns with a white light, combining with oxygen to form lime, which is called, in scientific language, calcium monoxide, and has the formula CaO. It is understood in every case that the atomic weight is signified by the symbols of the elements. so that if "CaO" is written in full it would show the relative weights of lime and oxygen in the compound, thus: $Ca = 40$, $O = 16$, or $CaO = 56$. What is this 56? It may be cwts., lbs., ozs., or any other weight, the whole expression meaning that in 56 parts by weight of lime there are 40 parts of the metal calcium, and 16 parts of oxygen gas. If the 56 is taken to represent cwts., then they will contain 40 cwts. calcium, and 16 cwts. oxygen, and so on, the percentage of calcium being always 71·43. Calcium is a most important chemical element to the builder, as it furnishes, in combination with carbon and oxygen, the whole material of many important building stones, and without it the manufacture of lime and cement would be altogether impossible. When water is thrown on lime the latter absorbs the water, and a dry powder called "slaked lime" is obtained. This is known scientifically as Calcium hydroxide (CaH_2O_2). If slaked lime is raised to a red heat the water is expelled, and "quick-lime" (CaO) remains. Quick-lime can, therefore, be slaked and unslaked at pleasure. (5) Magnesium is a hard, brilliant white ductile metal, which burns in air, giving out an intense bluish-white light of great actinic power, and therefore valuable as an artificial light in the photography of crypts, or other dark places in buildings. In burning, this metal combines with oxygen to form magnesia (MgO). Referring to the atomic weights given above, it will be seen that in 40 parts by weight of magnesia, there are 24 parts of magnesia and 16 parts of oxygen. Like lime, magnesia slakes with water, forming magnesia hydroxide (Mg,H_2O_2), this occurs in nature as the mineral "brucite." (6) Sodium is a soft, silver-white metal, easily cut with a knife; thrown in cold water it floats, disengaging hydrogen from the water; but in the decomposition of the latter, heat enough is not generated so ignite the hydrogen. If, however, the sodium is thrown into hot water, the hydrogen evolved burns with a yellow sodium flame. Combustion also takes place if the metal is thrown on a paste of thick starch. When the metal is burned in air it unites with oxygen, forming a mixture of sodium monoxide (Na_2O), soda and sodium peroxide (Na_2O_2) caustic soda. Soda is really sodium hydroxide ($NaHO$), Common salt is sodium chloride ($NaCl$). In every 58½lb. of salt there are 23lb. of sodium and 35lb. of chlorine. This substance forms beds of rocksalt in the new red sandstone rocks of Cheshire and Worcestershire. (7) Potassium is a silver-white lustrous metal which floats on water, and is lighter than any other metal, except lithium. This latter floats on petroleum, and is the lightest solid substance known. Potassium at ordinary temperatures is soft enough to be cut with a knife. Thin sheets of the metal exposed to the atmosphere, burn with a violet-coloured flame, and when thrown on water it decomposes the latter with evolution of hydrogen, which burns with the characteristic potassium flame.

Potassium combines with oxygen to form two oxides: the monoxide (K_2O), and the peroxide (K_2O_4), both are found mixed when the metal is burned in dry air. This mixture, if strongly heated, parts with some of the oxygen, and it is converted into the monoxide commonly called potash. Potassium hydroxide, potassium hydrate, or caustic potash, all names for the same substance, is a hard white and brittle mass, melting to an oily liquid. Its aqueous solution rapidly destroys animal and vegetable substances. One part of water dissolves over two parts of caustic potash with evolution of heat; it decomposes fixed oils, converting them into soap. Hence, it is largely used in the manufacture of preparations known as "paint removers." (8) Carbon is found in a free state in nature that is uncombined with any other substance, in two forms, "diamond" and "graphite." Diamond is the hardest substance known; it has never been melted, but it burns readily in air or oxygen until it is entirely consumed, leaving no solid residue—the entire substance is converted into carbon dioxide (carbonic acid). It is scarcely worth while to purchase a large diamond to try this experiment, so the reader had better take the statement for granted. The diamond cannot be made artificially, and how nature made it is not known; but it is tolerably certain the diamond was not produced at a high temperature. Graphite is a greyish-black substance with a metallic lustre, and is found in nodules or lumps in granites and other igneous rocks. That found in the Borrowdale green slate of Cumberland was once extensively used for making "lead" pencils. This deposit is now worked out. A coarser graphite is used as the ordinary black "lead" for cleaning stoves and other ironwork. There is no "lead," however, in the pencils, or the latter. Graphite from 20 to 30ft. thick is found in extensive beds at Lonora, in California; it is also found in Styria, Bohemia, and other places. Lampblack, gas-carbon, coke, and charcoal are all varieties of carbon more or less impure, and containing hydrocarbon. Carbon burnt in oxygen forms carbon dioxide (CO_2); this is a colourless gas, having a slightly pungent smell and acid taste; it does not support combustion, it extinguishes flame, and animals plunged in it are suffocated (not poisoned). This gas, also called "carbonic acid," is heavier than air, it is fourteen times heavier than oxygen, and may be poured from one vessel into another like water.

A candle-end lighted and fixed on the bottom of a jam-pot will be extinguished if carbonic acid is poured on it. Hence, before men are sent down into wells or other places containing stagnant air a lighted candle should first be tried there, and if it is extinguished, as it will be if there is 4 per cent. of carbon in the air, then it is unsafe to venture there, for if the atmosphere will not support flame, it will not support life. Carbonic acid is found in the atmosphere, and it is produced in large quantities of decaying animal and vegetable substances. It combines with other elements to form "carbonates," one of the most important to the builder being calcium carbonate, which is found crystallised as calcite, or arragonite, and these exist, as has been already stated, in large quantities in all limestones. (9) Iron is so well known as to need scarcely any description. It is seldom found in nature in the metallic state. It occurs, however, in numerous ores in great abundance, which are combinations of iron with oxygen and sulphur. The purest form of commercial iron in ordinary use is piano wire. This contains only a very small percentage of carbon. Cast iron contains carbon, silica, and manganese in varying proportions. It is converted into wrought iron by the removal of these impurities. Wrought iron, with about 1 per cent. of carbon in combination, is called steel. This latter, therefore, holds an intermediate place between cast and wrought iron. Iron combines with oxygen to form ferrous oxide (FeO) and ferric oxide (Fe_2O_3); these, again, combine to form the magnetic oxide, a ferroso-ferric oxide (Fe_3O_4), which is found in nature as "magnetite," a well-known mineral which attracts iron. Ferric oxide is found in nature as red hæmatite. Ferric hydroxide, $Fe_2(OH)_6$, is the well-known iron "rust." It forms the colouring matter of sandstones, tinging them from yellow to deep red. There is another compound of iron with oxygen—viz., ferric acid (H_2FeO_4)—but this is never found in a free state. (10) Sulphur is found in the neighbourhood of volcanoes in the free state in rhombic crystals, with no less than thirty crystallographic modifications. In combination with calcium and oxygen, it is found in glittering crystals in the London clay, and is called "selenite." It occurs in gypsum, and consequently in plaster of Paris, which is made from that rock. It also occurs in baryta (heavy spar, barium sulphate), an important adulterant of white lead. Sulphur combines with oxygen to form sulphur dioxide (SO_2) and sulphur trioxide (SO_3); the former brought in contact with water yields sulphurous acid (H_2SO_3), and the latter sulphuric acid (H_2SO_4). There are other compounds of sulphur with oxygen, but these are of interest only to the chemist. (11) The last important elementary constituent of the rocks on our list is chlorine. This does not occur in a free state, but it is found in large quantities combined with soda to form salt ($NaCl$). Chlorine, when set free, is a greenish-yellow gas, with a disagreeable and suffocating smell; if inhaled when pure, it causes death. It is two and a half times heavier than the atmosphere, and dissolves in half its volume of water. In combination with sodium, potassium, and magnesium, it forms the chief solid components of sea-water. Chlorine is not inflammable, and does not directly combine with oxygen; it readily unites with hydrogen to form a substance represented by the formula HCl, and which has the following names: Hydrogen chloride, Chlor-hydric acid, Hydrochloric acid, Muriatic acid, and Spirits of salts.

COMPETITIONS.

Pateley Bridge.—From several competitive schemes for the sewering of this district, that of Mr. A. E. Preston, of Bradford, has been selected. By its adoption, the sewage of Pateley Bridge and Bewerley will be conveyed by pipes down the valley for a distance of about a mile and a half, where after passing through filter arrangements, it will be disposed of by irrigation. The probable cost of the scheme is £6,000. Application has been made to the Local Government Board for borrowing powers to that amount, and an inquiry is to be held on Tuesday next.

Truro.—The four competitive schemes submitted under mottoes for draining the city and doing away with the contamination of the river Fal are now under consideration by Mr. Baldwin Latham, C.E., who has been instructed by the city council to advise them as to the award of the two premiums offered. At present the drainage and sewage matter from the water closets empty themselves in the navigable river. The following is an estimate of the probable costs, &c., as given by the authors:—

	No. 1, "A1."	No. 2, "Cornubia."	No. 3, "Fide et Spe."	No. 4, "Sanitas."
Estimated cost	£9,000	£13,000	£12,965	£12,915
Precipitation tanks—gallons	150,000	149,000	370,000	675,000
Storage reservoir—gallons	500,000	2,200,000	—	—
Annual working expenses............	£312	£415	£250	£439
Repayment of loan	£487	£706	£705	£702
Total cost per annum to pay off, principal with interest	£799	£1,121	£955	£1,142
Rate necessary......	7d. in £.	9¾d. in £.	8¼d. in £.	10d. in £.

The outfall for No. 1 will be opposite Trethellan Quay; for No. 2, near Mill House; for No. 3, Newham Railway Station Bridge; for No. 4, Lower Newham.

CHIPS.

A steam laundry which has been added to the Staffordshire industrial home for women was opened by the Bishop of Shrewsbury. It has been carried out from designs by Mr. W. O. Rooper, of Stafford.

Paisley town council have by a majority approved of extending the corporation baths given to the town about a year ago. The master of works has been instructed to prepare plans showing a new swimming-pond 75ft. by 40ft., twelve additional hot baths, and other accommodation.

The board schools, Silloth, Cumberland, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Mr. George Webster, sculptor, Queensferry-street, Edinburgh, has just completed in marble a memorial of the Rev. John Donaldson, M.A., which is to be placed in the church of Kirkconnel, of which he was long minister. The memorial takes the form of a mural tablet, having in the centre a portrait of Mr. Donaldson in high relief. The medallion is inclosed in a panelled frame carved on the marble.

Messrs. Comyn Ching and Co., Castle-street, Long-acre, have been successful in obtaining the contracts for providing and fitting up the elaborate steam and gas cooking apparatus for the kitchens in the new Post Office Buildings in St. Martin's-le-Grand, on the same principle as already supplied by them at the G.P.O. at Birmingham, Newcastle-on-Tyne, and the new Parcel Post Depot, Mount Pleasant, &c.

The district church of Holy Trinity, Ipswich, a meagrely proportioned building erected half a century since, is about to be restored at a cost of £2,000, towards which over £800 has been promised. The works will comprise the addition of a chancel, organ chamber, and vestry, the replacement of the high-backed pews with pitch-pine benches, the rearrangement of the aisles, the conversion of the base of the tower, now a vestibule, into a baptistery, the enlargement of the east window, removal and repair of the organ, and the provision of a new pulpit and reading-desk.

One of the largest of the chimney stacks belonging to the Burntisland Oil Company was thrown down on Friday afternoon. The stack was 160ft. high, and the top portion had become dangerous. The method of demolition proposed to be adopted was to wedge up where the bricks were displaced at the base, and saturate the wedges with paraffin oil, and ignite them. Just as the workers had finished operations, and were approaching to set fire to the saturated wedges, the structure was observed to sway, and it went toppling down on to the refuse heap behind the works.

"OLD MASTERS" ON THE CONTINENT.—XIII.

We illustrate to-day, as the thirteenth of this series of reproductions of notable paintings in Continental galleries, a religious figure-subject by a little-known German artist, Matthaüs Grünewald. The subject is "St. Mauritius and St. Erasmus," with attendant priest and soldiers, and the painting, which is over life size, now hangs in the Old Pinakothek at Munich. Further particulars are given in Mr. C. L. Eastlake's article on p. 884 *ante*.

OWENS COLLEGE, MANCHESTER: EXTENSION OF THE MEDICAL SCHOOLS.

These additions to the medical school occupy a parallelogram bounded on three sides by Coupland-street, Lloyd-street, and Walter-street, and thus represent the furthest possible extension of the college buildings in a north-westerly direction. From motives of economy the outward appearance of the additions has been kept severely plain, the only features which challenge attention being the tower over the entrance and the tall chimney-shaft. While the front buildings of the college are faced entirely with stone, the new addition, like the rest of the medical school, is of white brick, with stone dressings from the Burntwood Quarry. Although harmonising generally with the adjoining buildings, the additions have necessarily assumed a rather distinct character in appearance, owing to the large amount of window light which was a prime consideration in their construction. Almost everything has been set aside to attain this result, and it will be found that the elevations present quite an unusual proportion of window to wall surface. It has been sought by the character of the tower and entrance, and by the special treatment of the gables and parapet, to withdraw attention from what, though necessary to the functions of the building, might have appeared an architectural blemish. The architects of the new extension are Messrs. Alfred Waterhouse, R.A., and Son. We illustrated the college itself, with view, plans, elevations, and details, June 12th, 1874, from the working drawings of the original architect of the work, Mr. Alfred Waterhouse.

THREE WROUGHT-IRON SCRAPERS: NATIONAL BRONZE MEDAL DESIGNS.

These prize designs, by Mr. Arthur H. Baxter, of Leicester, were shown at the recent exhibition held at South Kensington Museum among the medal work of the year. As details for execution in wrought iron, they are possessed of some degree of freshness, and, being somewhat novel in treatment, are suggestive. The circular scraper, shown in the centre of our plate, is of perforated ironwork, and is intended to be attached to the wall by the rivets round the border, the scraper itself being semicircular and supported by a curved rod. The back of the scraper on the left side of the sheet is of perforated ironwork, attached to the wall by bolts in the centre and at the ends; the sides are also perforated, the curved inclosing frame being solid. Below the ornament a brush is carried round on three sides, beneath which is the scraper and tray, the latter being removable for purposes of cleaning. The scraper on the right hand of the drawing is made of wrought iron throughout with the exception of the bar, which is perforated, and has a removable tray, as in the previous design. Plans, views, and details are given with each design.

ST. PETER'S CHURCH, SOUTH TOTTENHAM.

This church is shortly to be erected on a corner site near Broad-lane and Cunningham-road, in a very populous neighbourhood of about 8,000, and in which there is only at present a mission-room for 250. The materials will be red brick and red Dumfries stone, green slates for roofs outside, and pitch-pine timbers panelled and moulded inside. There will be seating accommodation for 800, including the morning chapel, which will be seated with chairs for 74. A special feature has been made of the baptistery, and there will be spacious entrance porches, vestries, organ-chamber, &c. The nave is to be 29ft. wide, and will rise to a height of 49ft. in centre of roof panelling, above which a ventilating trunk will be formed between same and apex of roof. The estimated cost is £7,500. The architect is Mr. J. S. Alder, of Palmerston-buildings, Old Broad-street, E.C.

THE HIGH ALTAR SCREEN, ST. ALBAN'S ABBEY.

This drawing of the great screen behind the high altar of St. Alban's Abbey Church was exhibited at the Black and White Exhibition held in the St. James's Gallery, King-street, W., by Mr. F. G. Kitton, and a reproduction of the picture figures in Mr. Ashdown's "St. Alban's, Historical and Picturesque," a work to which we have previously referred. The statues, erected at the cost of Mr. H. Hucks Gibbs, under the direction of Sir Arthur Blomfield, A.R.A., were executed by Mr. H. Hems, and will be found illustrated in the Building News for Nov. 19th, 1886, and some others appeared in our issue of June 28th, 1889. Lord Grimthorpe's autograph design for the treatment of the crucifix in this screen was published by us on Nov. 22nd, 1889. The present drawing will enable the reader to see how the statuary takes its place in the composition, and it shows the vacant rood—which narrow-minded bigotry has so far succeeded in preventing the benevolent from furnishing with the figure of the Crucified Saviour of Mankind. The apostles and prophets and angels occupy the niches assigned to them, but the central object of the entire scheme and *raison d'être* of the whole thing remains absent in this senseless fashion to satisfy individual bias.

ST. JOHN'S CHURCH, ILKESTON.

This church is intended to meet the wants of a rapidly-increasing district at the southern end of the borough, and the first portion, comprising nave, south aisle, and porch, has recently been erected. The building stands on a prominent site overlooking the Erewash Valley, the land being the gift of the Duke of Rutland. Owing to the very limited amount at the disposal of the building committee, the design has been kept as plain as possible. The walls are of red Heather bricks, and the roof of green Carnarvon slates; the window-sills, and caps, and bases of columns are of Matlock stone; the octagonal columns are of purpose-made bricks, supplied by the Hathern Station Brick Co.; the moulded arches, strings, &c., were supplied by Mr. A. Wain, Heather, Ashby-de-la-Zouch. The contractor was Mr. W. V. Ireson, the joiners' work being done by Messrs. Hazlewood and Marson, and the plumbing, &c., by Mr. G. Andrew, all of Ilkeston; the wrought ironwork was made by Mr. E. Haslam, of Derby. The building was designed by Mr. P. H. Currey, architect, of Derby.

NEW BOARD SCHOOL, TODMORDEN.

This school, lately erected at Robinwood, about one mile and a half from Todmorden, for the Todmorden U.D. School Board, took the place of an old factory school formerly belonging to and managed by Messrs. Fielden Bros., but which had become much too small for the increased requirements of the district. The cost of the school buildings, including levelling of site, retaining and boundary walls, and caretaker's house, was about £3,000. The works were carried out by local contractors, from designs and under the supervision of Mr. Jesse Horsfall, F.R.I.B.A., architect, of Todmorden.

NEW HOUSES AT KINGSTON-UPON-THAMES.

The plans and designs of these houses, now being erected on the Kingston Estate for the Artisans' Land and Mortgage Corporation, Limited, are based upon those submitted and premiated in the recent competition. The estate, which adjoins Surbiton, is pleasantly situated, with a good approach from Surbiton Station, and to erect "good-class villas for good-class tenants at the most moderate rentals possible" is the architect's idea for its proper development. The present contract includes the erection of 20 villas from the drawings published to-day, each house containing three reception and six bedrooms, &c. (two corner houses having each seven bedrooms). They are to be substantially built, and faced as follows: on ground story, local red bricks in fronts, and whole of morning-room turrets with selected yellow stocks and red quoins and arches in backs; on first-floor story, rough cast both fronts and backs, returns to fronts, between each pair of villas in selected yellow stocks and red quoins and arches; on attic story, half-timbered and tile-hung gables, the stone dressings to porches, sills, strings, copings, and chimney-caps to be all of Bow stone (manufactured) of a very light buff colour. The roofs will be covered with Portmadoc slates, and red tile hips and ridges. Special regard has been paid to the appearance of these villas from back gardens, such appearance being deemed by the architect of little less importance than the street fronts, and inclosed kitchen yards are provided in all cases. The gardens will extend for about 80ft. from backs of houses, and in nearly all cases of the full width of the frontage of 34ft. 9in. The contractor is Mr. C. E. Skinner, of Chatham; Mr. N. J. Hill is the clerk of works, and Mr. F. Tupper White, of Herne Hill, is the architect.

CHIPS.

The parish church of Crantock, two miles from Newquay, is to be restored, from plans by Mr. Edmund Sedding, of Plymouth.

The Russian Government have decided to construct a new branch railway in the Caucasus from Tiflis to Kahetich, at a cost of two millions, which will be borne by the Treasury.

At a cost of about £700, the peal of bells in St. Bartholomew's Church, Crewkerne, has been re-hung and re-tuned, some re-cast, and two new ones added, the peal now consisting of an octave. The dedication ceremony took place on Wednesday in last week.

The Proudfoot Institute, situated in Mansfield Place, Moffat, N.B., was opened last week. The Institute consists of, on the ground floor, refreshment, smoking, and billiard rooms, with a recreation hall behind. Upstairs are the reading hall, library, committee and games rooms. There are also bathrooms and keeper's apartments. The building is in the Renaissance style, Mr. Crombie, Dumfries, being the architect. During the inaugural proceedings, a bronze bust of the late Mr. William Proudfoot, the work of Mr. J. M'Lellan Arnott, Dumfries, was unveiled.

An inquiry was held at the Town Hall, Leeds, on the 19th inst., before Mr. Thomas Codrington, an inspector from the Local Government Board, with respect to an application from the Leeds Corporation for sanction to borrow £100,000 for sewerage purposes in addition to £110,000 already sanctioned. Mr. Thomas Harrison, the city engineer, explained the proposal.

During the course of the operations connected with the reconstruction of the Edinburgh Hotel, Princes-street, Edinburgh, which is being converted into business premises, a stone forming a landing at the top of a flight of steps was tilted over on Wednesday week. One man, Alexander Flett, lost his life, and John Gallagher, a labourer, both in the employment of Messrs. D. Greig and Son, builders, the contractors for the work, sustained a compound fracture of the skull.

A new Congregational chapel is being built in Watkin-street, Grimsby. Mr. J. J. Cresswell, A.R.I.B.A., of Grimsby, is the architect; Messrs. Green Bros., of Grimsby, are doing the stonework; and Messrs. J. M. Thompson and Sons, of Grimsby and Louth, are the builders. The building, of brick with slate roof, is to be 53ft. long, 27ft. 6in. wide, and 23ft. high.

WAYSIDE NOTES.

Some of us stand on our dignity! I have a letter before me in which a Midland architect, writing to an assistant who had solicited work, and in ignorance of the great man's initials, had addressed him as "Mr.," adds: "Will you excuse me if I point out to you that it is usual to address architects as 'Esq.' as a matter of courtesy?" Well, it is, of course; but it is perhaps higher courtesy to ignore the non-use of a designation to which, after all, few of us are entitled. I am myself much in favour of the American plan of addressing a man simply as "John Jones" or "Tom Robinson." It has its advantage in these days, when every maid of all work is "Miss," and the shop-boy gets letters from her with the much-coveted affix the omission of which has vexed the soul of the writer of the letter before me.

The Works Department of the L.C.C. appears to be getting into disrepute, and many of the predictions made at its inception by those who understood what advantages workmen would take of a public works department appear to be coming true. Sir John Lubbock, whose voice has been raised against this department from the first, last week condemned it as undertaking an impossible task. We commented upon the proposal of the Council being its own contractors just two years ago, and remarked that we should look forward with interest to the results, hoping, in spite of the many defects of the scheme, that it would be a success. On the agenda paper of the Council for many weeks past have been reports from various committees asking for the confirmation of the grant of moneys, already spent upon jobs done by the works department, over and above the estimate of that department, and the value of the work as measured by the architect. The money was spent, so there was nothing for the Council to do but to sanction in each case an expenditure already disbursed. Now the complaint arises in the County Hall that the workmen themselves are notoriously lazy; for, said one member, it was a constant complaint throughout London as to the enormous waste of time by the workmen employed by the works committee. "If the workmen," said another member, "wished the scheme to be a success, they should give the full value of their labour." Again, a remark from another member is worthy of note: "It would startle the Council if they only knew the length of time it took some of their workmen to complete the most simple work."

Are these notes of distrust in the men notes of success of the department? If they are true, or if there is any foundation whatever for the complaint—and we presume there must be after studying the figures of the estimates and expenditures incurred—it is quite time that some alteration should be made in the control of the men. If idle men are permitted to fritter away their time on public works, where will the saving be we were taught to expect over the contractor's work? How will the ratepayer benefit? Surely events have proved Sir John Lubbock's warning, that "Government and municipal work is always more expensive than private work. . . . A municipality or a Government might control everything, but it could not undertake to do everything."

One of our contemporaries some few weeks since remarked that instead of the promised saving of from 30 to 50 per cent., which was constantly referred to as the contractor's profit, there had been no saving at all, but an admitted loss. We do not hear any public complaint as to the quality of the work, only that it cost more than the "corrected" estimates, which we take to mean measured value of the work in accordance with the priced schedule. There can be, therefore, no other way than waste of time in labour to account for the extra cost, and the warning given by Tuesday's debate may have a beneficial effect upon the department, and cause the foremen to look more sharply after their men. If this is not done, we prophesy that the works department will be one of the greatest municipal fiascos of the age. Referring again to our own comments two years ago, we remarked that the success of the scheme greatly depended upon the control the committee kept over their employés, and that it would be impossible for a body constituted as the committee is, to supervise every detail. It is in the detail that the defects of the scheme have now shown themselves. We cannot, therefore, level any complaint against the committee, but we do against the workmen as a body.

I hear that Messrs. Pearson and Co., the contractors for the construction of the Blackwall Tunnel, are just now experiencing not a little trouble and difficulty on account of a stratum of sand having been encountered in the course of the boring. So long as the boring progressed through the London clay everything went on smoothly, and rapid progress was made; but now the utmost caution has to be observed lest the works should be flooded, and damage to the extent of many thousands of pounds done through the flooding of that part of the tunnel already completed. If from this time forward all is fair sailing, it is anticipated that the tunnel will be completed and ready for opening in between two and three years' time.

Are church screens made nowadays so that the doors shall never shut? In a delightful paper in next month's *Sunday Magazine* on "The Old Gallery," the Rev. S. Baring Gould relates his experiences with an old parish clerk, who assured him that in every old church screen, "if it ha'nt been meddled with by them blessed restorers," the doors will not shut. On expressing his opinion that that was very odd, the old clerk came out with his explanation:—

> "Doan't ye see, your honour? Them old men as made the screens weren't bad joiners, and they weren't fules neither. They was a sight better joiners than we be now. The reason they did it was this. For sure sartain the chancel means heaven, and the body of the church means airth. And then doan't it say in Scriptur 'The gates shall not be shut at all'? Very well, if the chancel be meant to tell o' the heavenly Jerusalem, then the screen gates *must* be made not to fit, that never nobody may never be able to fasten 'em no more. The old men weren't bad joiners nor fules—not they!"

There's a wrinkle for the ecclesiastical tailors who supply so much of the church furniture nowadays! A bit of fancy ritual like that ought to fetch a big order from the Reverend Verdant Green, when he comes up for his next batch of vestments and church belongings.

In less than another hundred years, the perpetrators of an unfinished ugliness like the Wembley Tower will, I trust, have to pay a handsome rent to the public for spoiling the view in such a lovely locality. At the present moment a state of things exists which rather suggests comparison with an earlier experiment of the sort in connection with the Tower of Babel. The construction company has spent all its £100,000 of capital without achieving even the first platform, and now the ground landlord company has had to come to the rescue to prevent the abandonment of the enterprise. A little advance of £30,000 was sanctioned at a special meeting on Saturday. This, it is understood, will complete the tower up to 155ft.—not a particularly dizzy height for an expenditure of £130,000. The higher flights in ironwork which are to dim the reputation of M. Eiffel seem at this rate a trifle nebulous. Few people will complain, I fancy, if they remain so!

At a special meeting of the governors of the Royal South Hants Infirmary, held in that institution at Southampton on the 20th inst, it was decided to make a public appeal for funds to carry out the work of reconstructing the buildings, recommended in a special report made in July last by Messrs. Young and Hall, of London. The estimated cost is about £35,000, and as rebuilt the infirmary will contain 134 beds as against 111 at present.

The new Home for Single Working Men, erected at the foot of Sir Michael-street, Greenock, was opened on Friday. The home, which has accommodation for 225 men, consists of two buildings, four stories in height, with a space between occupied by the dining-room. The day hall forms a reading and recreation-room, and is 34ft. by 31ft. in size. At the right-hand side of the hall is the shop of the institution. Behind are the kitchen, scullery, women's washhouse, drying-rooms, with boiler and heating chamber.

The parish church at Starcross has been recently reopened, after restoration from the designs of Messrs. Rowell and Son, architects, of Newton Abbot. One of the new features is a memorial pulpit; this is Perpendicular in style and octagonal in plan, and is made of English oak. The base is moulded, and the upper portion has recessed panels on each of its seven sides. These are traceried and carved at top and bottom, and the structure is surmounted by a moulded and carved cornice. Messrs. Harry Hems and Sons, of Longbrook-street, Exeter, carried out the work.

OBITUARY.

Mr. Morton Meacher Glover, A.R.I.B.A., of Queen Victoria-street, E.C., and Berrystead, St. Peter's-park, St. Alban's, died recently, after a long and painful illness, in his fiftieth year. Mr. Glover some two or three years since had a serious illness, and underwent several operations at the hands of London physicians. Mr. Glover was articled to Messrs. Habershon after matriculating at the University of London, and became in due course a hard-working and successful student of the Royal Academy. He assisted the late William Burges, A.R.A., in the preparation of his drawings for the Law Courts competition, and soon afterwards designed a large chapel at Drayton Park, N. Many chapels and similar works followed, including the Baptist chapel in Dagnall-street, St. Alban's, of which he was a member, and many houses and business premises in that city, as well as a small church at Chesham, Bucks. At St. Alban's also he designed and carried out for Sir Blundell Maple, M.P., the Sisters' Hospital, illustrated by us in our issue of September 1, 1893, and also a public park, both given by Sir Blundell to the city. Extensive additions to the Grand Hotel at Eastbourne were carried out by the deceased, with Messrs. Patman and Fotheringham as contractors and Mr. Henry Lovegrove as quantity surveyor. This was probably Mr. Glover's largest job. When the late Mr. Edwin Salter, of Bucklersbury, E.C., died, Mr. Glover carried on the practice for a few years as Glover and Salter. He afterwards became the head of the firm of Glover and Harris, of 46, Queen Victoria-street, E.C., and took up his residence in St. Alban's about fifteen years ago. He was the son of the late Mr. Stephen Glover, the well-known musical composer, and himself possessed considerable musical ability. Mr. Glover was architect to the Chesham School Board. In 1884, in conjunction with Mr. Salter, Mr. Glover was one of the architects selected to send in designs for the new Admiralty Buildings; their design was illustrated in the Building News for August 8 and 15, 1884. He had been an Associate of the Institute since 1870. The funeral took place at the family vault at Chesham, on Wednesday week.

CHIPS.

A portion of the Oussouri section of the Trans-Siberian Railway, between the port of Vladivostock and Monraviewa Amoursky, a distance of 235 miles, was opened for traffic on Friday.

The New York State Forest Commission have recently made provision for a State park of some 30,000 acres in the heart of the Catskill Mountains. It will be situated in a beautiful region in the vicinity of Slide Mountain, the highest peak of the entire Catskill range.

The corporation of St. Alban's have received from the town clerk the gift of new furniture for the council chamber, executed in wainscot oak, including seats, desks, and a table; and from Alderman Fisk a new British Axminster carpet, covering 126 yards. The works have been carried out by Alderman Miskin, of that city.

The engineer-in-chief estimates that the total cost of the drainage of Melbourne on the system which is now being carried out will amount to £2,694,352.

The Bath Rural Sanitary Authority voted their surveyor, Mr. Sheppard, £130 on Saturday as remuneration for extra services in connection with new works of water-supply.

An iron church, built to supply the temporary needs of St. Bartholomew's district, was opened in Caldwell Hall-road, Ipswich, on Friday. It has been built by Mr. George Stephenson, of Hadleigh, is matchboarded within, and is seated for 300 persons.

The State Geologist of Georgia reports that a belt of marble, 60 or more miles in length, has been discovered in the northern part of that State. Some of the marble is of a flesh-colour tinged with green, and some is a light grey banded with black. It can be obtained in large sound blocks, and is susceptible of a high polish. The report, however, suggests that, on account of the mountainous character of the region in which it lies, it will be costly to quarry it.

On the 19th inst., new offices, surveyor's house, workmen's cottages, stables, &c., for the Shilton local board, in the county of Durham, were formally opened. They have been built with local bricks and Houghton Bank stone dressings, at a cost of £1,600, by Mr. Thos. G. Henderson, of Shildon, from designs by Mr. J. W. Taylor, F.R.I.B.A., of Newcastle-on-Tyne.

THEATRES.—XLVII.

By Ernest A. E. Woodrow, A.R.I.B.A.

I HAVE endeavoured to teach in this series of articles that, by observing the result of accidents and calamities which have occurred, architects can learn to design and build so as to avoid them in future. No better textbook can be studied than that of the statistics of theatre fires, which authorities on the subject have compiled. I am indebted to Mr. Wm. Paul Gerhard, C.E., for much valuable information on this subject, who speaks of the research of Herr August Foelsch, a German civil engineer, recently deceased; of Herr Franz Gilardone, a retired German fireman; of Captain Sir Eyre M. Shaw; of Dr. Choquet, a French physician;, and of Mr. John Hexamer, an insurance surveyor, of Philadelphia. I purpose concluding this series by imparting to my readers some of the information which Mr. Gerhard has kindly forwarded to me.

There are, first, cases where fires occur in a theatre, and are at once extinguished by the fireman on duty; of these no record appears to exist. Then there are cases of false alarm, accompanied frequently by disaster. The cause of fires which break out in the night is seldom explained satisfactorily; therefore, it is the fires which occur before or during the performance from which the lessons are to be gathered.

The risk from fire immediately before the performance, and while the audience is admitted, is found to be three times as great as during the hours of the day, which is explained by the fact that at this time the gas-flames are lit, which illuminate the scenery. Theatres are safest in the daytime. The danger is increased in preparing for the performance, is reduced during the performance, on account of the extra watchfulness on the stage, but is still twice what it is during the day. Two hours after closing is the time when the maximum danger is reached, and then it is seven times the day risk, and is reduced during the rest of the night to three and a half times as great as during the day; the risk arising at that time is from smouldering sparks.

The fact that the risk and danger during the time the people are coming in is actually greater than during the performance, does not seem to be generally considered, and is the strongest argument of the necessity for architects to design their theatres so that an incoming crowd may turn and find free, unobstructed, and ready egress, without any attendant having to remove barriers or unfasten doors. Again, the fact that after the building is vacated, it is found that two hours after the performance is the most dangerous time in the 24 hours, on account of the fire-watch not being as keen as during the presence of the public in the building,—this teaches the architect the necessity for sub-dividing his building into as many fire risks as possible by fireproof construction and fireproof doors to the openings, so that should a fire break out unseen in any room it may be confined to that room.

The following table is given by Mr. Gerhard from 289 fires in theatres:—

56 burned	between 7 a.m. and the afternoon	or 19·4 p.c.
15 ,,	one hour before the beginning of the performance..	or 5·2 ,,
36 ,,	during the performance ..	or 12·4 ,,
66 ,,	within two hours after the close of the performance..	or 23·9 ,,
113 ,,	during the night or before 7 a.m. next morning	or 39·1 ,,

The age which a theatre attains is a matter of considerable interest. Mr. Gerhard deals with this question in the following list. Out of 252 examples—

Theatres burnt down.	
5	before they were opened.
70	in the first 5 years after opening
38	between 6 to 10 ,, ,,
45	,, 11 ,, 20 ,, ,,
27	,, 21 ,, 30 ,, ,,
12	,, 31 ,, 40 ,, ,,
20	,, 41 ,, 50 ,, ,,
17	,, 51 ,, 60 ,, ,,
7	,, 60 ,, 80 ,, ,,
8	,, 81 ,, 100 ,, ,,
3	over 100 ,, ,,
Total 252	

From this it will be seen that, out of 252 theatres, 70, or more than one-fourth of them, were destroyed before they reached five years. Theatres, therefore, do not attain an old age, and Herr Foelsch figures the average life of these 52 theatres at 22¾ years. For the United States the figures are 11 to 13 years; but it must be remembered that these figures were reached before the more strict laws of building were inforced. It is further explained that recent analytical studies of this question have elicited the fact that there are two periods in the life of a theatre building when it is most endangered or subject to destruction by fire—first, from the time of its construction up to five years of age; second, from 40 to 50 years. This is accounted for by the fact that, in a new theatre, the safety appliances, the arrangements for lighting, the stage machinery, and the fire-protecting appliances are rarely in perfect working order at the outset, and that the employés have not then become acquainted with, and accustomed to, the handling of them, and are likewise unfamiliar with the rules of management.

The second period is explained by the fact that, after so many years, the apparatus and appliances of the theatre have become worn out or useless, and are not always kept in repair or replaced by new apparatus; also that, after a lapse of many years, the management may be less strict, and often interior alterations are made which add to the danger.

The next table, which has been compiled by Mr. Gerhard from statistics gathered by Herr Foelsch and Dr. Choquet, shows that from the middle of the last century the annual average loss of theatres by fire has been 19 in all countries. Choquet's figures are in parenthesis.

In the years 1751 to 1760	there were	4	
,, ,, 1761 ,, 1770	,,	8	
,, ,, 1771 ,, 1780	,,	9	(11)

,, 1888	,,	15	,,	up to Nov.

The number of victims of theatre fires which have occurred during a performance must be of sad interest. The subjoined table, gathered from the same source as those above, gives in detail the figures of victims in theatre fires during a period of ten years, as compiled by Dr. Choquet:—

In the years.	Victims.	
1751 to 1760 ..	10 ..	
1761 ,, 1770 ..	4 ..	
1771 ,, 1780 ..	154 ..	(Amsterdam, 1772, 25d.) (Saragossa, 1778, 77d. 52w.)
1781 ,, 1790 ..	21 ..	
1791 ,, 1800 ..	1,010 ..	(Capo d'Istria, 1794, 1,000v.)
1801 ,, 1810 ..	37 ..	
1811 ,, 1820 ..	85 ..	(Richmond, Va., 1811, 72v.)
1821 ,, 1830 ..	105 ..	(Philadelphia, 1829, 97v.)
1831 ,, 1840 ..	813 ..	(St. Petersburg, 1836, 800v.)
1841 ,, 1850 ..	2,114 ..	(Canton, 1845, 1,670v.) (Carlsruhe, 1847, 63d. 203w.) (Quebec, 1846, 200v.)
1851 ,, 1860 ..	241 ..	(Livorno, 1857, 43d. 134w.)
1861 ,, 1870 ..	104 ..	
1871 ,, 1880 ..	1,217 ..	(Ahmednugger, 1878, 40v.) (Brooklyn, 1876, 283v.) (Shanghai, 1871, 120v.) (Sacramento, 1876, 110v.)
1881 ,, 1885 ..	628 ..	(Nice, 1881, 70v.) (Richmond, 1885, 100v.) (Vienna, 1881, 450v.)

In the year 1887 .. Paris, 150 victims.
,, 1888 .. Oporto, 140 victims.
,, 1887 .. Exeter, 200 victims.
,, 1892 .. Philadelphia Central Theatre, several dead and wounded.

Placed in order of their frequency, Mr. Gerhard tabulates the origin of theatre fires as follow:—(1) On the stage. (2) In the actors' dressing-rooms, in the engine and boiler room, in the cellar, and in the administrative offices. (3) In the stores, offices, living apartments, or restaurant kitchens in the theatre. (4) In the auditorium. (5) In outside causes, such as exposure to neighbouring buildings on fire.

He proceeds to explain that in not a few cases the cause of the origin is for ever unknown, due to the rapidity with which the flames spread among the vast mass of combustible materials, and to the haste and confusion incident to a fire, especially when this breaks out during the night. From the above tables, it is gathered that the majority of fires, break out on the stage during the presence of the audience, owing to the stage illumination. Carelessness in lighting up, handling lights, torches, candles, and lamps, defective gas apparatus on stage and in dressing-rooms, and use of fireworks, are the most frequent causes of these calamities. Other causes are smoking, careless use of oxy-hydrogen light, use of firearms, carelessness in workshops and workrooms, defects in heating apparatus, non-removal of rubbish and trade refuse, accumulation of large masses of combustible materials, spontaneous combustion from oil-rags, &c.; these are among direct causes of fire.

Indirect causes are undesirable site, danger from adjacent premises, bad arrangement of plan, bad materials in building, faulty construction, misuse of parts of the premises, dangerous trades, want of fire watch and appliances.

Panic arises from an outcry of alarm with or without cause, the sight of fire, the presence of smoke, the unannounced darkening of the house (as so fatally illustrated in Belfast but a few days since), the sudden extra pressure of gas, especially in footlights, a fire alarm in the neighbourhood, reflection of fire, thunderstorm and lightning, persons fainting, horses or animals on stage becoming unmanageable, too few exits, badly-planned exits and staircases, crowds meeting, obstructed gangways and corridors, doors opening into dark passages and staircases, &c.

The best ways to prevent fires and panic have been fully discussed in these numbers, so I need not go into Mr. Gerhard's list, which adds nothing new to what I have already dealt with.

Briefly, let me summarise that in these articles we have seen that one of the essential conditions of successful theatre-planning is the provision of a suitable site and the exclusion of dangerous surroundings. The substantial and perfect construction follows next in importance, together with the division of the building into many fire risks by fireproof construction. The wide corridors, the well-planned staircases, the many exit doors arranged on a symmetrical plan, are self-evident parts required for a successful whole.

Recognising the fact that a theatre is built for theatrical representations, and that they entail the employment of much inflammable material, we have seen how, in designing the building, safety may be increased by providing a fit and proper place for everything so constructed and arranged as ever to induce perfect order and tidiness on the part of the servants of the theatre. What all these places are, and where they should be located in relation to other parts of the theatre, has been gone into at length, and the exclusion of workshops from the building has been dwelt upon.

The stage being the most hazardous part of the building, and its arrangements and use being perhaps but little known and understood by the general body of architects, this part of my subject of necessity has occupied a considerable portion of my attention. Details of stage machinery and scenic appliances, which would scarcely be considered as coming under the architect's province, have been described and illustrated as essential parts of a complete theatre ready for working. My theory throughout has been that the architect should be acquainted with every detail and every part of the building; should understand the reason of their requirement, the manner in which they are used; should be cognisant of the methods adopted for manipulating scenery, lighting the stage, creating "effects"; should be acquainted with the manner of conducting the business in front of the house as well as behind, before he can design a safe and successful theatre. I am aware that it is not the opinion of all that the architect should be *au fait* in all matters appertaining to theatrical management and display; but from my personal experience I affirm that architects who understand the uses to which their building must be put are alone likely to be able to design a useful and successful theatre. I have mentioned how, when judiciously planned, a theatre will cost less in weekly salaries for attendants than when built with no judgment of its ultimate ends—a house of business.

The greatest difficulty in theatre design is, without doubt, the attainment of a perfect sight line from every seat; yet if this is not accomplished the theatre is a dead failure financially as well as architecturally. The very object of a theatre is to provide a building in which plays can be acted, seen, and heard.

Fittings and fixtures seem small items in themselves; but their importance asserts itself as necessary for the due carrying on of the business, and the fact that their being overlooked, badly arranged, or faulty in design, will lead to accident, blocking of exits, and loss of life. This is surely sufficient to compel the architect to include the consideration of every detail in his design—barriers, ticket-boxes, bolts, seats, lamps, gas-fittings, &c., must not be beneath his notice. I have even gone so far in these articles as to point out that it is the business of the architect to provide means for the actress in her dressing-room to heat her curling-tongs.

Sanitation, ventilation, and fire-protection must all be accomplished by the architect.

Even the provision of a lightning-rod must not be omitted when it is remembered how last August the Reading Theatre was destroyed by being struck by lightning.

My task is ended, and it is with somewhat a feeling of fear that I have dealt with a subject in more detail than the requirements of these articles demanded, that I conclude this series of papers in this number.

In the early stages of my work I pointed out that my programme would be the collection of information scattered in the form of lectures, newspaper articles, pamphlets, letters, &c., as the works on theatre building were few and far between. I have been greatly assisted in the collection of the information by Mr. Edwin O. Sachs, whose knowledge of the Continental theatres has enabled him to help me in many of my articles. I have also had great help from many other gentlemen in the loan of drawings and notes, which I have duly acknowledged at the time of their use and production. The references to foreign regulations have been made under each head or detail of my subject instead of in the form of some chapter upon legislation and government. This was done in order that the opinions of foreign experts might be gathered by my readers on each subject as it was discussed.

NOTES FROM EDINBURGH.

THE building trades for the past year have had a fairly good time, with steady work and wages, although the amount of speculative building has been perhaps under the average of former years. Steady employment is due mostly to the erection of large undertakings, which have been completed or are nearing completion, and as work of this description is contemplated, the prospect for the coming year is favourable, and as good as can be looked for in the present general depression of trade.

The largest undertakings just completed is the new asylum for the better class of patients, built where the old Scotch mansion of Craighouse used to be; but the new edifice is much more conspicuous, and makes as good an appearance as any of the many larger hospitals which adorn the environs of the city. Originally the contemplated expenditure amounted to £30,000, but the completed establishment has cost £100,000. With its advantages of situation and appointments of the best description, it will probably be found not too large for the demands for its very superior accommodation. The new Caledonian Railway station is now open for all traffic, and the architectural as well as the engineering departments of the work have been a costly and very laborious undertaking. It cannot be said that the combination makes a happy whole. So far as the station is concerned, the arrangements are admirable. The interior is wide and well-lighted, and everything that could be desired. But owing to the determination of the company to carry out their buildings to the extreme limits of their property, the aspect of the architectural screen-work and the convenience of access have been very much impaired. The entrances are all close to each other, and though each is large enough in itself, they are placed in a very acute angle, which makes access awkward. The long eastern elevation is almost entirely a covered carriageway for cabs, which could very well have been dispensed with for a wider area of access. The plan of the station proper at entrance is nearly that of the prow of a large ocean steamer, and there is some interesting and curious, but by no means elegant, engineering in the roof to combine the great width of the shed with this awkward angle. The effect of the design on the street architecture of the west end of Prince's-street is not good, and the attempt to screen the monster shed behind must be pronounced a failure. The triple-arch gateway, with its mountainous roof of slate and all the stately architecture on either side, is really an obtrusive impediment to free access to the trains and out of harmony with everything beside it.

The new St. Cuthbert's, also finished during the past year, has kept workmen busy for a much longer period, and is a conspicuous addition to the architecture of the city. It suffers greatly from the character of its site; but from its great altitude looks better than might have been expected, built so much below street level. The style of the edifice is Classic, simple and severe, and unexceptionable in the choice of its details, though this style is perhaps, and unavoidably, the very worst that could have been selected for such a site. The present clerical mania for apses and towers and Anglican arrangements has told on the design, and made it of portentous length. The desire, also, to make it hold about 800 more than the old building, which was seated for 2,000, has not improved either its proportions or convenience. The end gallery is 30ft. deep, and the great majority of seat-holders under it see very little to distract their attention except the pulpit, the gallery beam, and an interminable array of heads and bonnets. The apse ceiling comes too low down, and eclipses the heads of its windows, and the apse itself is rather lengthy for a church interior so wide. The church can boast of having the first and only stone altar-table existing in the Presbyterian churches. It is a handsome marble one, designed in white Sicilian, with panels of dark marble. The best thing about the interior is the decoration, which is very tasteful in colour and design. The desire to have some more of decorative detail on the exterior has led to the erection of two turrets at the east end, which, though very pretty in all detail, are too much in the Later Renaissance style to harmonise with the simplicity of the rest of the edifice, and, indeed, the west front, never very imposing, now looks very much in need of something to make up for being left out in the cold.

Another very large undertaking, and which, from the unusually florid detail of its architecture, will be the most conspicuous corner in Princes-street, is the reconstruction of Messrs. Dewar's premises. The Edinburgh Hotel, facing the Waverley Station Bridge, is to be a hostelry no longer, and is being converted into premises for business in the same line as Dewar and Co. The old haberdasher has developed into the genial provider of furnishings for house and person (not excepting mental entertainment in the way of cheap novels), and Princes-street will contain three such large establishments, the third being at the western extremity, all on a scale of great magnitude. The work on Dewar Buildings has been very rapidly carried out within the year, but will not be completed for some time, and till the roof is finished it will not be seen in all its due proportions. There is some very effective circular corbelling about the cornice line, and an immense amount of stone-cutting and carving and sculptural embellishments.

Three churches have been added lately, all with galleries more or less in the old Presbyterian style. The supply of school accommodation has not yet met the demand for it, and so long as the school boards determine to provide for secondary classes, the demand is not likely soon to be satisfied. Another large school, to cost about £20,000, is being built for the Broughton district on the north east, in a locality by no means densely populous, but for the immediate necessity of providing for the overflowing requirements of adjacent schools.

The new buildings for the Electric Lighting Trust occupy about an acre of ground, and are a conspicuous object from the Caledonian line. They are not without architectural detail towards the streets, and show a novelty in the way of chimney architecture, being square in plan, with pilasters, and an effective cornice, &c., at the top. Five large boilers, weighing each 25 tons, are required to work the apparatus, and it is expected that the system will be set to work in March.

A commencement has been made in the way of preparing for the work of reconstructing the North Bridge, and a committee of the council are engaged in getting estimates of the cost of a girder-bridge between the Regent's Arch and Jeffrey-street, which would greatly relieve the heavy traffic which has now to pass up the steep gradient of Greenside-street and over the North Bridge to the south side.

The rapid and somewhat eccentric development of the art of advertising has for long made itself noticeable here, as elsewhere, in the hoardings in front of vacant stances in outlying or other less popular thoroughfares. There is about half a mile of it, forming a profitable investment for all parties, and serving as a screen to prevent the public witnessing popular gymnastics in the grounds of the new Academy. But it is to be feared that the bill-sticker's success is likely to influence the architecture of the city in a more offensive way, and the shopkeeper is not to rest content with his plate-glass window. Hitherto there has been some regard paid to architectural propriety in the design of shop-fronts, with their apparently too-slender supports. Even the wide expanse of window can be made agreeable, and in Shandwick-place, the latest novelty, a large arch spaning the entire width of the tenement, has a good appearance, the eye being satisfied with the security of the structure and proportions. But of late one of the most prominent corners of Prince's-street is being reconstructed—for new shops, on the ground floor—in a fashion so absurdly grotesque in the proportions of what has hitherto been a respectable adaptation of the Classic frieze, that it is obviously a development of the advertising mania. The sign-board in question, which serves for a number of ordinary looking shops, is of preposterous breadth, and rests on the usual spider-legged supports, with details of the most meagre description in timber. The hoarding overhead—for it is little better—is large enough for the top of a three-storied tenement, and the wonder grows in what style—pictorial or otherwise—the shopkeeper will advertise his wares. Meantime the unsightly projection is surely worse than some of the hanging sign-boards which the Council have tried successfully to dispose of.

COUNTY LUNATIC ASYLUMS.—IX.

By George H. Bibby, F.R.I.B.A.

STAIRCASES AND CORRIDORS, &c.

IN many asylums the staircases are very defective, being dark, narrow, and so planned that patients have chances of concealing, falling, or purposely injuring themselves. The staircases in all large asylums should be so arranged that there may be at least two means of escape from every day-room or dormitory; the stairs should be built of stone, or materials of fire-resisting qualities, be without winders or long straight flights; the well should either be built up solid, or otherwise used and inclosed to form a ventilating shaft, &c. The divisions separating the staircases from the various apartments should also be of fire-resisting materials, and handrails must be securely fixed on *both* sides of all staircases.

These arrangements are applicable as well to the staircases for the exclusive use of the attendants and nurses as to those for the patients, for experience has, unhappily, shown that there can be few more terrible or heartrending calamities than the burning of a large asylum.

All the doors (at all events of important rooms) should be so hung as to open in the direction of the exit to the staircases; therefore the staircase landings should be enlarged so that these doors, when opened, shall not impede the passage by reducing the width of the stairs at any point.

The reason for omitting or blocking-up the open wells in staircases is that these afford favourable opportunities for committing suicide. The number of steps in a straight flight should not exceed eight or ten as a rule; the treads may be 11in. and the risers 6in.; the handrails should be of wood, and of a contour suitable for giving the opportunity of a comfortable and firm grip by the hand.

These alternative staircases are, of course, very costly additions; but in large asylums they are of great importance, and should never be omitted. They are not for everyday use (except by officials as a ready means of making a circuit through the wards); they should be locked, the panic key

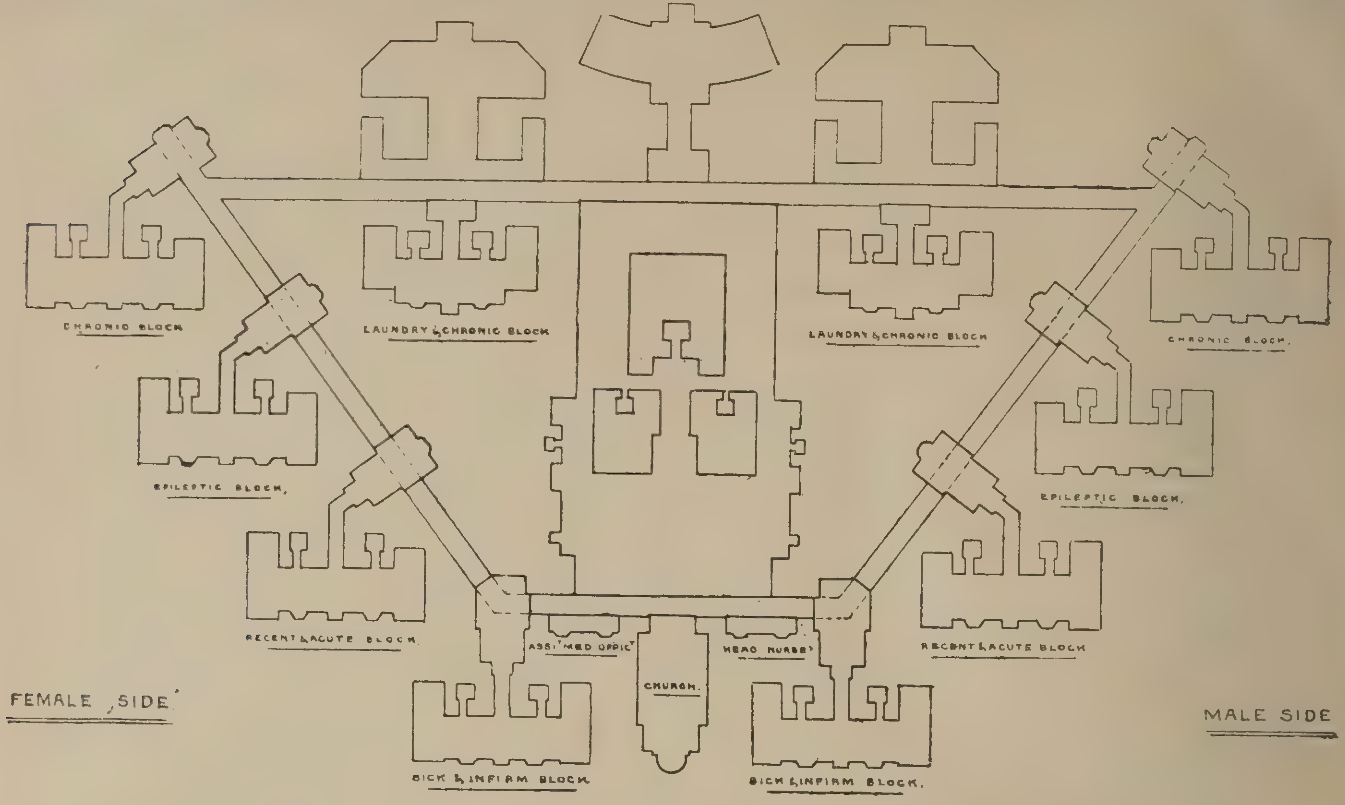

Fig. 19.

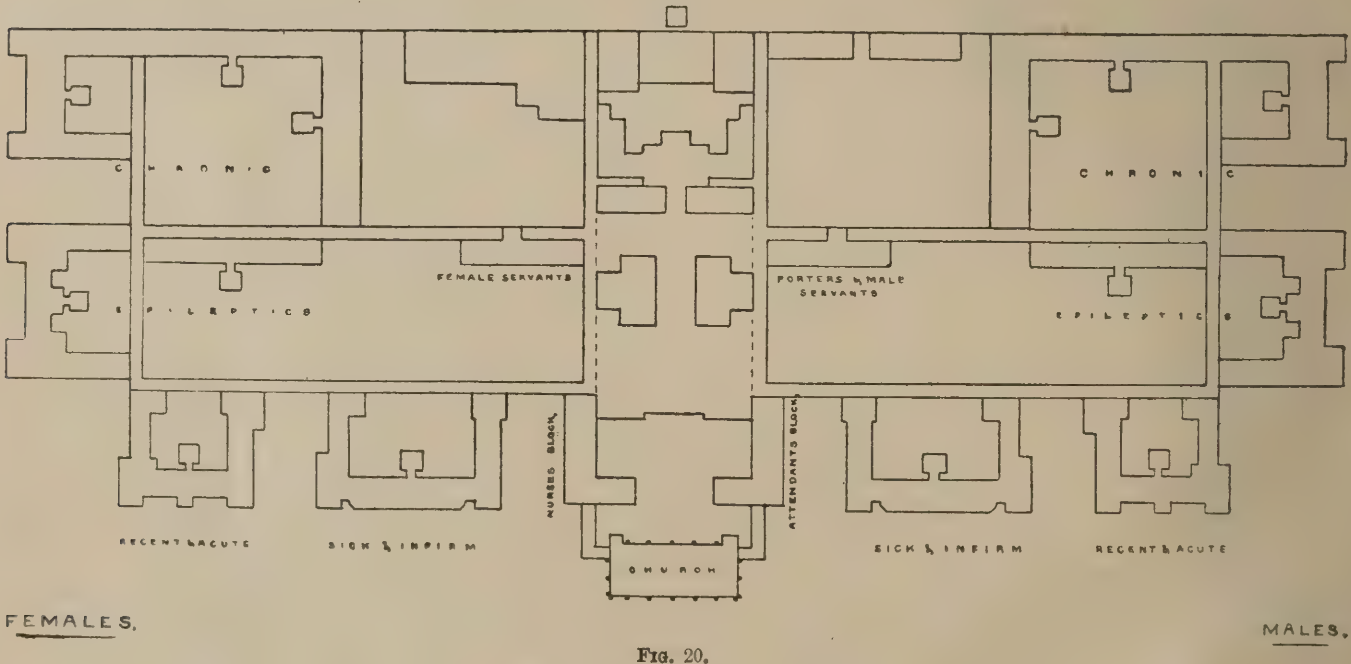

Fig. 20.

being kept in a glazed box, the glass to be broken when the key is wanted, the breaking of the glass causing a general fire alarm. The upper officials would, however, pass through with a master-key.

Epileptic patients are so liable to fall and seriously injure themselves during a fit, that special precautions are necessary. Epileptics fall forward or sideways as a rule, and are, therefore, more likely to be badly hurt when coming down than in ascending a staircase; therefore the approaches to the staircases, as well as the flights of stairs, should, as far as possible, be arranged so that the attendant and nurses may be reasonably near passing patients.

The ground and upper floors should usually be upon one level (at all events, in each block of buildings). Flights of three or four steps, or odd steps between the various wards, are very objectionable and dangerous. In large asylums it occasionally happens that the site is so uneven that there must, for reasons of economy, be differences in the levels of the blocks for the patients and various departments of the administrative buildings. In these cases it is always far preferable that the main and other corridors should be inclined rather than steps should be inserted, and for the additional reason that it is convenient to be able to wheel a supply waggon or other appliances.

Another point in the planning of asylum staircases sometimes overlooked is the advisability of arranging so that the noise and traffic thereon shall not be an annoyance to those who may be confined to their dormitories during the daytime. For this reason staircases, should not, as a rule, open *directly* into or very near to a dormitory, whether it be upon the ground or any upper floor; the staircases and lobbies thereto would be lighted by windows, the splayed sills of which should be high above the landings or steps, protected as far as necessary from damage by destructive patients, and with due regard to any possibilities of escape, suicide, or other disaster. Any gas or electric lights on the stairs and elsewhere should be placed also beyond the reach of patients.

The staircase and its landings sometimes afford suitable localities for the hydrants, fire appliances, buckets, hose, &c.; but if these be placed near, very ample space should be allowed (over and beyond what is required for passage-way), and these appliances also must be as far as possible protected from damage or interference by patients.

During the variations that take place in a patient's conduct, a change in his gait is frequently observed. He does not lift his legs properly, walks stiffly, involuntarily deviates to one side when attempting to walk straightforward, and easily stumbles if the floor be at all uneven—for example, when going over a step; hence the absolute necessity of planning an asylum without unnecessary steps. Some of these classes of the

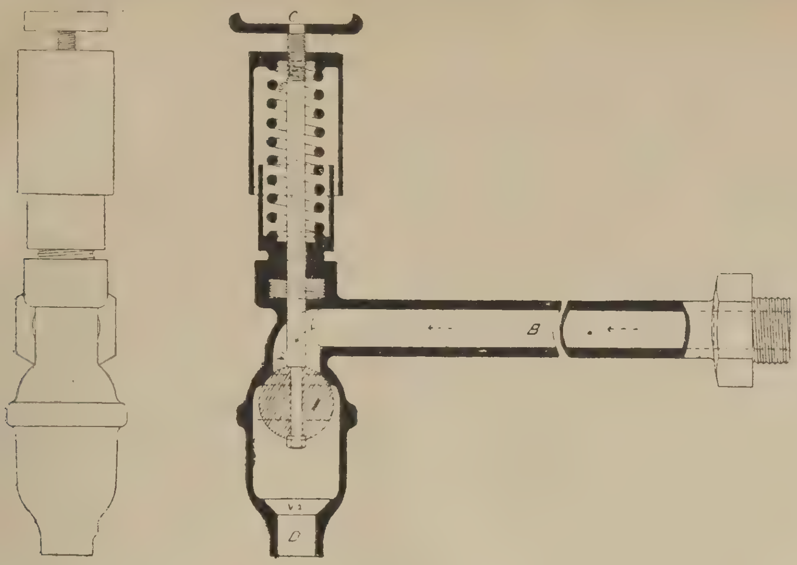

Fig. 21.

insane take a pleasure in walking about a great deal; some of them even experience a constant desire for a restless change of scene. They like to take long walks, and to the inexperienced eye nothing striking is presented so long as they keep upon level ground; but the gait eventually becomes still more unsteady, like that of a drunken man—the feet are dragged after him; the knees appear as if they would collapse; he must support himself by a wall; stumbles every moment, and frequently falls; the arms become stiff; objects are grasped convulsively, and occasionally suddenly let fall. Under such possibilities as these, it is obvious that the fewer the levels in an asylum the better for all concerned.

The day-rooms of asylums may be either on the ground or the first floor (but seldom or never upon a higher level) therefore the boot-room, previously mentioned, may often be placed with advantage near to the staircase, so that patients coming in from the airing-courts shall not bring dirt, &c., on to the stairs, on their way to the *upper* day-rooms. In some instances it may be useful to have two boot-rooms adjoining each other, one for each floor; this might be useful for separating patients of different classes, when those on an upper floor require to be specially classified.

In some county lunatic asylums it has been found convenient to form the staircase blocks into towers to carry water-tanks. These might be either over the centre well, or otherwise placed over the entire structure of the staircase. These tanks would usually form an independent supply for the wards or blocks of buildings for the various classes of patients.

These tanks would, however, be in addition to a main tank or tanks for the supply of the whole asylum, with a capacity for not less than 15 gallons per day for each inmate; if the source be rainfall, the tankage should provide for 120 days' supply.

The position of the great tanks must necessarily vary with each asylum according to the level of the surrounding lands, but may be in a water-tower, a horizontal roof tank over the boiler-house, or elsewhere as may be found expedient; water supply for bath and laundry purposes may be better placed over the boiler-house than water for drinking and cooking purposes.

The corridors of a county lunatic asylum are frequently of great length, and should be of ample width where affording direct communication from the patients' wards to the dining-halls and recreation-rooms, &c. They should, for a large county asylum, seldom be less than 8ft. or 10ft. wide, but are occasionally rather more; being of such great lengths, it is easy to arrange for gentle inclines (instead of steps), which I have already referred to.

Of whatever materials these corridors may be erected, it is necessary to provide against the possibility of fire communicating through from one block of buildings to another. To avoid this there should be fireproof portions at the communications with each block of buildings; the windows of the main corridors should not exceed in number those actually required, and should be so disposed that patients occupying the airing-courts may not be seen whenever their habits or condition renders it desirable that they should be kept as much out of view as possible (and this is a condition which should be observed elsewhere throughout the asylum). There should, however, be no dark corridors anywhere in any asylum, and if it should be found inconvenient to place windows in any part of the walls, skylights must take their place.

As a rule, the corridors are best if with an open roof, with skylights at intervals. There should not be more corners or sharp turns than can be avoided; these long, straight corridors afford the nurses and attendants very good opportunities for observing the conduct of those patients who may not be confined to their own wards, but are engaged in cleaning or sweeping the corridors and adjacent parts.

The flooring of the corridors may either be of wood-paving or of some of the artificial stone-pavings, such as Stuart's granolithic, the Adamant Company's flooring, Lawford's asphalte, Polonceau asphalte, Willis and Astley's flooring, patent Victoria stone, Val de Travers, Wilkinson's concrete paving, &c. Some floorings have been found to give faint and unpleasant odours after washing; others become slippery, loose, or uneven, and as the amount of material used is frequently very great, it is of special importance to select that which is durable.

There is an obvious advantage in arranging the corridors, when practicable, in long straight lengths, without sharp turns or corners, where patients might continue for a dangerously long period out of sight; these corridors are frequently 200ft. or 300ft. in length, sometimes much more, and, therefore, an attendant or other persons passing to and fro would necessarily command a good view from end to end, and secure a better supervision than otherwise might be practicable.

In Fig. 19 is shown a diagram of a plan which, though it has some advantages, is designed without regard to the necessity of reducing the distances over which the officers would have to travel from the administrative centres; the superintending medical officer, for instance, in going his rounds from ward to ward, would have to pass over much of the ground more than once, there being but one entrance to each block of buildings from the main corridor.

In Fig. 20 this difficulty is entirely overcome, and there is a convenient approach to all parts of the asylum; each ward having two entrances from the main corridor, and the staircases being placed near these entrances, the upper floors are equally accessible. (See also Fig. 1, p. 388; Fig. 4, p. 564; Figs. 5 and 6, p. 565; and Figs. 10 and 11, p. 673.)

Below the corridors a subway is sometimes contrived, through which the heating and water-pipes, &c., are carried, or in which some of the ventilating arrangements are provided, and "Blackman" or other fans are driven for the purpose of propelling the heated or cool fresh air.

At suitable points along the corridors should be placed the hydrants for use in the event of fire, with hose-boxes or racks, and the usual appliances. In connection with these should also be contrived convenient arrangements for not only filling the fire-buckets, but also such other buckets, &c., as may be requisite for supply or for cleansing the floors near, so as to avoid the inconvenience of the carriage of water to any considerable distance.

To avoid the waste of water (which may be occasioned by patients and others *forgetting* to turn off a tap) a simple and ingenious contrivance has recently been patented, by which the buckets may be hung over the valve empty, and when filled the united weight of bucket and water would stop the further running of the water. (Such an apparatus as this would certainly be very useful in many other places than asylums—for instance, outside public-houses where carters and cabmen sometimes carelessly allow water for their horses to run out of filled buckets over public footpaths.) This contrivance may shortly be in the market, and the following description of it has been supplied to me by Mr. Charles L. Wilkin, of St. Edmund's-terrace, Regent's Park, the inventor, and is here first published, although the idea has been approved by several competent authorities.

In Fig. 21, the support for the bucket-strap is shown at C; B is the barrel of valve to be fitted to main supply-pipe; and I is the indiarubber ball; S the spring; V 1 and 2 the valve seatings, and D the delivery nozzle.

This valve may be used for automatically filling and keeping filled fire-buckets, stable, or any other buckets requiring to be kept constantly filled with water.

Fig. 21 represents the supply of water "cut-off" by means of the ball (I) and the seating (V1).

By suspending the bucket (by means of its "bail" or strap) over the support or carrier (C), so that the buckets hang immediately beneath the delivery nozzle (D), the weight of the bucket is sufficient to partially overcome the resiliency of the spring (S) and release the ball (I) from the seating (V1), and so allow an outlet round itself for the flow of water from the main supply-pipe through the barrel (B) to the bucket; the gradual flow of water into the bucket increasing correspondingly in weight until the resiliency of the spring (S) is completely overcome and the supply of water is "cut off" by means of the ball (I) and the seating (V2).

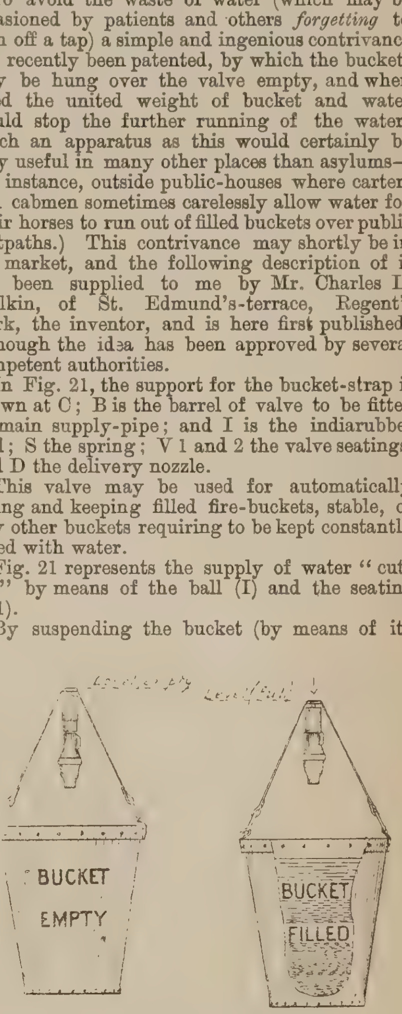

Fig. 22.

On the removal of the bucket, the spring (S) acting in the opposite direction, causes the supply of water to be "cut off" by means of the ball (I) and the seating (V1), as in the position indicated.

A supply of water may always be had by substituting a pressure equal to the weight of an empty bucket upon the support or carrier (C).

Fig. 22 shows the relative positions of the buckets when filled and empty, and generally it will be admitted that a self-acting contrivance, such as above described, should be useful as a precaution against the inconveniences or waste arising from the forgetfulness of persons, whether they be the inmates of an asylum or a public-house.

Memory is variously affected in mental disease; sometimes it is unimpaired as regards the events of the former life as well as the occurrences during the disease. Dementia, in particular, is characterised by feebleness of such a kind that events happening at the present time are quickly (even instantaneously) forgotten, while there is a distinct recollection of events that took place in former periods of life, which may even be the theme for well-considered conversation.

Any disease of the brain may impair or destroy the memory, consequently the state of the memory in many of the insane indicates the severity of their malady.

(*To be continued.*)

HISTORY OF THE TOWER BRIDGE.*

THE handsome quarto volume prepared, under the direction of the Bridge House Estates Committee, by Mr. Charles Welch, F.S.A., librarian of the Corporation of London, is ostensibly an official publication, and describes not only the new Tower Bridge, but gives an historical account of the other bridges over the Thames built by the Corporation of London, and an account of the Bridge House Trust from the 12th century, based on the records of the Committee. An historical review of the subject, by the Rev. Canon Benham, B.D., F.S.A., forms a fitting introduction. Canon Benham acknowleges his indebtedness to a blue-book published last year by the Corporation, which had been prepared for the Royal Commission on the Amalgamation of the City and County of London, the information in which had been gathered from many sources. The writer recounts the many public works accomplished by the Corporation during the present century, beginning with the opening of London Bridge in 1831. Other events follow, such as the passing of the Reform Bill, 1832; foundation of the City of London School, 1834; opening of Royal Exchange, 1849; many royal visits to London. Later we have the removal of Temple Bar, 1878; dedication of Epping Forest; opening of the New City of London School, 1882; opening of new council chamber, 1884, &c. These several events are briefly and graphically described. The bulk of the volume is occupied by "The Story of London Bridge down to the Middle of the 18th Century," followed by Chapter II., on the "Last Days of Old London Bridge, its Successor and Sister Bridges, A.D. 1750 to A.D. 1894." This portion of the volume has been written by Mr. Welch, and is illustrated by an interesting series of reproductions, including Agas's map of London in the time of Elizabeth; an illuminated view from a MS. volume of poems in the British Museum, facsimiles of the warden's accounts for 1422, sketches and seals, ancient seal of the Bridge House, old City seal, an interesting reproduction of an engraving of London Bridge by John Norden, about A.D. 1600, views of the bridge gate from Visschir, chapel of St. Thomas on the bridge, old London Bridge after the removal of houses, 1758, &c. Many interesting events and incidents are recorded in this part in connection with the old bridge. The structure endured many perils by flood and fire. We read of a severe and lasting frost in 1281, which carried away five arches; the ice was very thick and dangerous. In 1564, and again in 1608 and 1683, severe frosts occurred; in the latter year the river was converted into a solid mass of ice "to that degree," says Maitland, "that another city, as it were, was erected thereon," with streets and shops, carriages, and "diversions of all sorts, and near Whitehall a great ox was roasted whole on the ice." Printing-presses were set up on the ice, and coaches plied from Westminster to the Temple, and sledge-races, puppet plays, &c., took place. In 1715 a severe frost took place, and a fair was again held on the Thames. In the next year a violent gale of wind from W.S.W. reduced the stream so low that people crossed it on foot above and below the bridge, and passed through most of the arches. Again in 1739-40 another frost-fair was held. Many fires are recorded on the bridge, notably one which broke out in 1504 at the northern end, destroying six houses; and a more destructive one in 1632-3 at the same end, which consumed all the buildings on both sides to the first gap. Forty-two houses were destroyed owing to want of water, the Thames being almost frozen over. The gates and towers and other architectural features on the bridge are described at some length. The gates, as we see them in Visscher's old engraving, were in frequent use in the 13th century. The Great or Stone Gate often bristled with traitors' heads. Stow places its erection in 1426. There was a drawbridge between the sixth and seventh piers of Peter of Colechurch's stone structure, which allowed vessels to pass, and a wooden bascule spanned it. Many facts and incidents are recorded as to its erection and frequent repairs. It was commenced in 1176. The description of the new Tower Bridge by Mr. John Wolfe Barry, C.B., M.Inst.C.E., forms the third chapter, and is illustrated by several photo. illustrations, showing the completed structure and its progress at different stages, besides plans, sections, and details in the letterpress. We have so recently described and illustrated the bridge that it is unnecessary to say anything here. Mr. Barry describes every principal feature in the problem, the foundations of the piers, the great caissons constructed, and the difficulties met with in sinking them evenly. Details, plans, and sections of the piers explain every part of their construction; plans at various stages, and very interesting diagrams of the bascules and their counter-weighting are given. Sir Horace Jones's design and that submitted to Parliament show the development of ideas, though the present structure differs greatly in general design and detail. This part of the volume will possess a permanent value to the architect and engineer. Chapter IV., by Mr. Philip Norman, F.S.A., deals with "The City, the Tower, and the River." As an historical narrative of ancient London, and a monograph of one of the most important engineering works of this century, the volume will take its place in every complete library.

BOOKS RECEIVED.

The Thumb Ready-Reckoner (London: Henry Frowde) is a little waistcoat pocket-book about 2in. by 1½in., clearly printed and handsomely bound in morocco, containing tables giving calculated results from one-sixteenth of a penny to 19s. 9d., together with interest and discount tables, weights and measures, foreign money, &c., a very useful and acceptable present for all business people, and which is small enough to be put in an ordinary-sized purse.——*Transactions of the American Society of Civil Engineers* for September contains a paper by John A. Bensel, M.Am.Soc.C.E., on "Removal of Rock 40ft. Below Surface of Water," and discussion; also a paper on "Form of Railway Excavations and Embankment," by J. D. Whittemore, past-president, and papers on the "Tequixquiac Tunnel," "Friction Rollers," "Hoisting Apparatus," &c. It is fully illustrated.——*The Essex Review*, No. 12, Part III. (Chelmsford: Edmund Durrant and Co. London: T. Fisher Unwin, Paternoster-row), contains, under the heading of "Essex Churches," a descriptive and illustrated account of All Saint's, Rettenden, by Mr. Fred Chancellor, F.R.I.B.A. The plan shows a building with nave, chancel, and one aisle, and a western tower opening into nave. The piscina and sedilia and the bench ends are good examples—the latter are of 15th-century character. The author thinks there is strong evidence of a priest's chamber on north side of chancel, and he gives the plan of room over vestry. Other interesting papers and notes and queries are also given.——*The London Building Act*, 1894, by A. J. David, B.A., LL.M. (London: Crosby Lockwood and Son), is one of the first books we have received on this important statute. The author has given the full text of the Act, with the by-laws and regulations of the London County Council passed last November. The notes appended to the sections are very useful, as they show in most cases the alterations that have been made. The new provisions have been distinguished also in the text by placing them in parentheses. It may be noticed also that the author calls attention to several new features of the Act, as the establishment of a Tribunal of Appeal, and the sanction the Act gives to the judicial decisions of the old law, the service of notices, &c. There is a good index, and a table of cases. To all architects and district surveyors and builders, Mr. David's manual will be welcome. ——*Proceedings of the Engineers' Club of Philadelphia* for November contains several interesting papers on "Electro-Metallurgy of Gold and Silver," by A. L. Eltonhead; "Atmospheric Resistance," by Professor Walter L. Webb; "Notes on Unit Stresses for Railroad Bridges of Wrought Iron," by Professor Silas G. Comfort. ——*Engineer and Surveyor's Nineteenth Annual Report* of the Willesden Local Board, by O. Claude Robson, engineer and surveyor, is a bulky report of over 200 pages, giving an account of works executed by the Willesden Local Board during the year ending March 25th. It appears from the report that over 41 miles of highway have to be maintained, and an additional length, represented by 19 private streets, has been dedicated to public use. Referring to the formation of these roads, the carriageways are of 12in. of brick rubbish as foundations, 6in. of coarse gravel consolidated with a 10-ton roller, the channelling of three courses of Enderby granite cubes, the pathways of tar 3in. thickness laid on 4in. of concrete. Wood paving has not been largely adopted, though Mr. Robson rightly advocates its use in all main thoroughfares, such as High-street, Harlesden, Malvern-road, Kilburn, Cambridge-road, Harrow-road, &c., where the omnibus traffic is large. Other matters touched on are the question of municipal labour and the value of classifying the men according to their skill, &c.; watering, sewering, up-cast shaft ventilation, flooded districts, lighting, &c. ——*The Quantity Surveyor*, by Charles Henry Searle, Parts, 2, 3, 4. (London: Chas. Henry Searle, 16, Southwark-street.) In noticing the first part of this valuable publication, we briefly described the main object its author had in view in grouping the trades. Mr. Searle's system is a thoroughly scientific classification of trades intended to facilitate and help the memory, and illustrates the most approved methods of measureing the various artificers' works, preparing bills of quantities, and drafting specifications and contracts. For the last-named purposes we consider the work a very useful compendium of information which every surveyor and architect should have on his office table. Thus, in Part 2 we have, under "Group I.—Conditions of Contract," such matters enumerated as improper materials or workmanship, vouchers, inefficient workmen, deviations with and without authority, detail drawings, valuation of variations, and other clauses of the conditions are given under various sub-groups. A form of "memorandum of agreement" for small works is given, and various explanatory notes. Part 3, under "Group III.—Trade Descriptions," embraces all preliminary descriptions of materials and their use for the several trades. For specifications, preambles to bills of quantities, these particulars are valuable, and the analysis follows a particular list of trades. Thus we have sub-groups under the heads of Dimensions, Material, Working, Fixing, &c. The sub-groups on Bricks, Limes and Cements, Bedding Materials, Stones, are very useful. These trade descriptions are continued in Part 4. Under the head of Working every modern method and process is described, and the specification clauses are printed in large type.——*The Architect and Surveyors' Diary for* 1895 (London: Waterlow Brothers and Layton, Ltd.) is a useful one. It contains lists of the members of all the professional associations, and the London Building Act, 1894, is printed *in extenso*.——*The London Building Act*, 1894, by W. F. Craies, of the Inner Temple, Barrister-at-Law (London: Lovett and Maxwell, Limited; and Stevens and Sons, Chancery-lane).—The literature on this new statute is increasing fast. We have reported three or four papers read at the Institute, Society, and Association on the new Act, setting forth the leading changes in the building legislation, and we have now to notice publications. Mr. Craies' edition has the great advantage of showing how old enactments have been dealt with under the new Act. The text of the Act is taken carefully from the Queen's printers' copy. The introduction points out the objects and scope of the Act, what it includes, and its effect generally on local authorities. Reference is made to several matters, such as connection of drains with main sewers, which is subject to Sect. 4 of the Metropolis Management (No. 2) Act, 1890; the construction of closets, dustbins, under Sect. 39 of the Public Health (London) Act, 1891; hoardings; drains and water supply, these latter matters being still dealt with by the local vestry or district board, and in the City by the Commissioners of Sewers. The power of the local authority under Michael Angelo Taylor's Act, and other Metropolis Management Acts as to widening, altering, and improving streets, are saved by the new Act, Sects. 6, 213. The establishment of a tribunal of appeal and its powers are noticed, and also the provisions for open spaces, and the author gives the principal alterations made as to construction. By the table of enactments it is seen at a glance what are repealed by Sect. 213, and in the margin of each section is given the sections of the old Act, by which the reader will be able to compare the new with the old provisions. The repealed sections are not only placed in the margin of the text, but the new sections are inclosed in square brackets.

---

* History of the Tower Bridge. By Charles Welch, F.S.A. With a description of the Tower Bridge by J. Wolfe Barry, C.B., M.Inst.C.E., and an introduction by Rev. Canon Benham, B.D., F.S.A. London: Smith, Elder, and Co.

The table of enactments shows what has been done with each repealed section of the Acts. These are valuable features in Mr. Craie's edition, which commend it to the architectural profession.——*The London Building Act*, 1894, by Professor BANISTER FLETCHER, F.R.I.B.A., &c. (London: T. Batsford), is another useful textbook for architects, surveyors, builders, &c. The Act is printed *in extenso*, and the author, as before, gives a full abstract, which summarises all the new sections relating to buildings set out in tabular form. This is a useful feature which forms an index to all the parts of the Act relating to construction, and will be of value to the architect. The main alterations are pointed out; also the unrepealed sections relating to building, and the by-laws and regulations in force are given. The plates showing thickness of walls, plans of chimneys, openings and recesses in party and external walls, sections showing the least height allowed for habitable rooms in the roof, &c., are clear, and will be found a great help. As a handbook for the use of the architect and surveyor practising in London, Professor Banister Fletcher's work is the most complete, for it contains not only the full text of the new Act, but also those portions of the Metropolis Management and Amendment Acts, which are still in force, and which relate to buildings.

CHIPS.

Alterations are being made to Killicks-lane Board School, Mitcham, embracing the ventilation, which will now be carried out on the Boyle system, the latest improved form of self-acting air-pump ventilator being adopted for the extraction of the vitiated air, while fresh air is admitted through their improved air-inlets.

The result of the great fire at the Phœnix Timber-yard, Lawrance-road, South Tottenham, on Wednesday and Thursday in last week, was the destruction of the moulding mills, timber stores, drying-sheds, sawmills, and workshops. The property was owned by W. D. Tucker, timber merchant.

The new parish church day schools at Dudley were opened on Dec. 20th. The building, which is situated in Upper King-street, has been erected at the cost of £2,000.

The time expired on Friday evening for depositing copies of all private Bills which will be introduced into Parliament during the ensuing session. The total number of Bills deposited within the required time was 170, or an increase of four as compared with the number of Bills deposited last year. Of these Bills, 138 relate to England, 16 to Scotland, and 16 to Ireland.

The German Emperor inspected, on Saturday, the statues of nine Prussian Princes of Hohenzollern, which he has ordered to be placed in the White Hall in the Palace. With the exception of the late Emperor William, they are all represented in youth. The statues of the Great Elector, Frederick I., Frederick William I., Frederick the Great, and Frederick William II. are placed in niches along the wall opposite the throne. The other statues, those of Frederick William III. and IV., and the Emperors William and Frederick, stand to the right and left.

The monument to Father Damien, the Apostle of the Lepers, has been unveiled at Louvain. The structure, of which M. Constantin Meunier is the sculptor, is over life-size, and represents Father Damien pressing the crucifix with one hand to his heart, while with the other he protects under his cloak a leper.

The Swiss National Council has approved the proposal already adopted by the State Council for granting a concession to a Zurich firm for the construction of a railway up the Jungfrau by way of the Scheidegg, the Eiger, and Mönch.

An inquiry was held on Friday at the Salford town-hall by Major-General Crozier, R.E., on behalf of the Local Government Board, with regard to the application of the Salford Corporation for sanction to borrow £30,000 for gasworks purposes.

The first sod was cut on Friday on the site of the new reservoir designed to supply the town and harbour of Troon, Ayrshire, with water under a gravitation scheme. The estimated cost of the work is about £12,000.

The Southport town council resolved, on Friday, to apply to the Local Government Board for power to borrow an additional £7,000 in order to complete the marine drive now in course of construction. The increase in the estimates is chiefly due to the larger bridge which is to be constructed to cross the junction of the two lakes, and also to the approaches, which will be at a higher level than was originally planned, the bridge being approached by one continuous slope from the Upper Promenade. The present application will bring the total cost of the work up to £28,000.

Building Intelligence.

BLISLAND.—The parish church of Blisland, six miles north-east of Bodmin, was reopened last week. The church was originally a little cruciform building of the Late Norman period, to which in the 15th century there were added a tower, north and south chancel aisles, and a south aisle; but the tower was not built, as usual, at the west end, but at the end of the north transept—probably because that was higher ground. During the long incumbency of the late two rectors, who were father and son, the church itself fell into an unusually bad state of decay and dilapidation. The church has now been transformed in appearance. The external roofing has been renewed throughout, but the waggon-headed ceilings of the nave and aisles have had nothing done to them, and the old bosses, corbels, and carved wall-plates remain. The chancel roof has been re-ceiled in oak, an exact copy of the old nave roof, with timbers of great thickness and strength, and the spaces between the ribs are filled-in with fibrous plaster, and the figures on alternate panels representing the Holy Name and the Blessed Sacrament. The Perpendicular windows in the end of the south chancel aisle have been filled with stained glass. The artists were Messrs. Bucknall and Comper, London. The ways have been paved with Delabole and Portland stone, and under the seats is to be oak parquetry. The architect was Mr. F. C. Eden, of Staple Inn, Holborn, and the general work was done by Mr. Pett; masonry, Messrs. Worth and Sons; and Mr. Nankivell, carpentry. The total cost of the work has been about £1,300.

LONDON, W.—The foundation-stone of the new Claridge's Hotel, off Brook-street, Bond-street, was laid on Saturday. According to the plans prepared by the architect, Mr. C. W. Stephens, the new building will have frontages both in Brook-street and Davies-street. It has been designed to afford accommodation for about 200 visitors, and will contain some 260 rooms, of which 200 will be bedrooms. The structure, which is to be carried out in red brick in the Queen Anne style, and will harmonise with other buildings lately erected on that portion of the Duke of Westminster's property, will have a total area of about 27,000sq.ft. Separate entrances are to be provided for Royalty, and private suites of rooms will form a feature of the scheme. The elevation of the hotel is about 100ft., and it will contain six floors, in addition to a mezzanine and a ground floor. A winter garden will be provided.

NEWCASTLE-ON-TYNE.—The interior of St. Matthew's Church, Summerfield-street, Newcastle, has been much beautified of late. The latest adornments were dedicated by the Bishop of Newcastle on Sunday. The new work in the sanctuary consists of the side panelling executed in Caen stone. The south side contains the sedilia, and the space on the north side has a frontal box with aumbries above. Marble pavement in Frosterley and Sicilian squares have been laid in the chancel, and dwarf stone screens erected on the north and south sides of the choir. The former works have been carried out by Mr. Robert Beall, of Newcastle, and the latter by Mr. Caldcleugh, of Durham, who is at present erecting the tower. The whole of the work has been carried out from designs by Messrs. Hicks and Charlewood, of Newcastle.

New business premises, called the Imperial Buildings, are in course of erection at the corner of Westgate-road and Cross-street, Newcastle-on-Tyne. The elevation in both streets is carried out in polished Kenton stone in a free treatment of Classical architecture. The work is being carried out from designs and under the superintendence of Mr. J. W. Taylor, F.R.I.B.A., architect, of Newcastle. Mr. W. C. Tyrie, of Gateshead, is the contractor, and Mr. Henry Bulmer, clerk of works. The cost of the buildings, exclusive of land, is about £11,000.

To meet the demands of Morecambe and the increasing population in Lancaster and district, application has been made to the Local Government Board by the Lancaster Corporation to borrow £62,000 for constructing a second reservoir, capacity of 125 million gallons. An inquiry was held on Dec. 20th before an inspector from the Local Government Board. It was stated that £133,000 had been already spent on the water supply, the profits more than covering the interest and sinking fund. Mr. James Mansergh, C.E., approved of the scheme. There was no opposition.

Intercommunication.

QUESTIONS.

[11268.]—**Modelling.**—Would anyone inform me of a book on modelling, and much oblige?—H. D. S.

REPLIES.

[11266.]—**Acoustics.**—I think that this building will be successful, but the trusses will not, I fear, look very nice; probably they are more ornate than the sketch shows.—H. L.

[11267.]—**Masonry.**—There is no really good book on this subject; that by Mr. E. Dobson is the most modern. For the method of measuring stonework "G. T. S." can consult Mr. J. Leaning's book on "Quantities," or back numbers of the "B. N." Setting-out could hardly be acquired from books.—H. L.

Legal.

PAVING APPORTIONMENT.

IT is most important, especially in laying out new seaside properties, that the paving expenses should be fairly apportioned, so that the actual houses built may not be overwhelmed with heavy preliminary charges. A striking instance of this arose recently at Clacton (*Times*, Dec. 15), noted in our issue of Dec. 21, and in which, fortunately for owners and builders, the local authority were held liable to bear its share of the paving expenses. The facts were such as may at any time occur again at similar new seaside resorts. The dispute arose between the local board of Clacton and the owners of a row of houses fronting the sea shore. There was a broad footway in front of the houses, then came a road 36ft. wide, and then a green sward or lawn between the roadway and the sea, of which the local board were the owners. The board objected to have any portion of the paving and road-making expenses charged to them in respect of this green sward or lawn, which was their property, and argued that the owners of the row of houses should pay the whole of the charges. It appeared, however, that the board were willing to share the expenses of making the roadway itself with those owners, but objected to bear any part of the cost of the footpath; on the ground that it applied to the houses only, and had nothing to do with the lawn. The owners resisted this, and the magistrates decided in their favour; but stated a case for the High Court.

The Divisional Court, consisting of Baron Pollock and Mr. Justice Grantham now upheld the magistrates' decision, and felt so certain about their view being right that they refused leave to the local board to appeal further. The judge based their decision upon section 10 of the Private Street Works Act, 1892, a new statute which has not yet come much before the Court. The main purpose of that section is to provide for the provisional apportionment of paving expenses against the premises fronting, adjoining, or abutting on the street in question. They hold that it was clear that this green sward or lawn "abutted" on the new street that was to be made, and therefore the local board, as its owner must, bear their apportioned share of the expenses to be incurred. The general application of their decision to other similar cases in which land is laid out in the same way should have the effect of materially reducing the very heavy expenses, &c., which otherwise would entirely fall upon the owners of new houses as frontagers.

FRED. WETHERFIELD, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

NOTE.—All questions for reply in this column must be headed "BUILDING NEWS," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

A. V.—ARCHITECT.—DESIGN.—AUTHORSHIP.—If you allowed your design to be submitted to competition in his name, he being then your employer, I do not see how you can now hope successfully to make good your claim to being its real author.

A well-known surveyor, Mr. H. Lovegrove, has won the medals offered by both of the fancy clubs for the best specimens of Italian poultry with a handsome Leghorn pullet.

The Woman's Building for the Cotton States Exposition, to be held at Atlanta in 1895, is to be designed by two young ladies, Misses Mary N. Gannon and Alice J. Hands, now students in the New York School of Applied Science for Women, whose sketch-plans were chosen in competition.

LEGAL INTELLIGENCE.

Shackleton v. Lister.—Obstruction of Light.—At the West Riding Assizes, held at Leeds, Mr. Justice Collins heard this case on Dec. 18 and 19. The plaintiff, George Shackleton, of Allerton, near Bradford, sought to obtain an injunction to restrain Messrs. O. B. Lister Bros. from interfering with the light accruing to his cottages. It was stated by plaintiff's witnesses that the lighting of the cottages had been materially affected by the erection of a house by the defendants. The witnesses of the latter, on the other hand, asserted that this was not so. Defendants' counsel submitted that, even if the lighting of the plaintiff's cottages had been interfered with, an injunction ought not to be granted. Such a decision would cause a greater wrong to the defendants, by causing them to pull down a new house, than to the plaintiff. The Court had power, he submitted, to award damages in such cases instead of granting an injunction. The real cause of the action was that the view had been interfered with, not because there had been any material diminution of the light. His Lordship, in giving judgment, said the plaintiff had made out that the defendants' building had interfered to a substantial extent with the access of light to the plaintiff's cottages, and had also interfered with the comfort and even the health of the inhabitants. He was of opinion that the true remedy was the remedy by injunction. He therefore gave judgment for the plaintiff, and granted an injunction to restrain the defendants from permitting so much of the new building to remain as interfered with the plaintiff's right of light.

Re Alexander Braid.—The debtor, trading as a builder in Fore-street under the style of A. Braid and Co., has furnished an amended statement of affairs showing unsecured debts £6,859, and debts fully secured £71,736; assets, £2,848. An application for the approval of a composition arrangement agreed to by the creditors will be heard after the Vacation, and the Official Receiver reports in favour of the debtor's proposal.

A Building Arbitration Upheld.—Britton and Another v. Veale.—This appeal, heard by Mr. Baron Pollock and Mr. Justice Grantham on Friday, arose out of a contract for the building of an hotel at Ilfracombe. The ground landlord, Mr. Veale, wished to cover his land with an hotel, and entered into the contract in 1890. The hotel was completed at a cost of £11,000, and was sold to a company. In the mean time disputes arose as between the builder and the building owner as to the balance due, with reference, on the one hand, to extras, and on the other hand to omissions. The original contract, in 1890, was for £5,475; but an enlargement being resolved upon, there was a second contract for £1,583, and a supplemental one for £435; a third was for £992, making £8,485; and then there were extras, £2,500, swelling the total amount to £10,985. The main question was as to the extras; but, on the other hand, there were complaints by the building owner that, after all these successive extensions, there were considerable omissions from the design and the contract. The contract provided that on any point in dispute the decision of the architect should be final, especially as to values of extras or deductions, but did not require that payments should be made on his certificate, and by far the larger part of the expense had been paid. In January last an action was brought by the builders for a balance of £1,087, and giving credit to cash paid for £637. The case was referred to the official referee, who had reduced this amount to £552, for which amount he made his report for the plaintiffs, the builders. The building owner—the employer—objected to his report, being dissatisfied, mainly on the ground that the referee had refused to enter into any matters which the employer might have brought before the architect and had not done so, which, it was said, shut out most of the defence, though, in truth, both parties had tacitly agreed to discard the architect, neither of them having appealed to him. Mr. Houghton appeared for the employer, the building owner, who objected to the referee's decision, and urged that, as in fact the parties had not appealed to the architect, it was for the referee to enter into the matters in dispute and decide them—the omissions, for instance, which were serious; instead of which, he had virtually avoided determining them, and had thus, in fact, excluded the employer from his defence. Because the employer had not appealed to the architect, was he to pay for work not done? There were manifest omissions—for instance, of concrete in the foundations, of drains, of water-closets, &c. For all these the employer was to pay, merely because he had not appealed to the architect and got his decision. The defence had, in truth, never been gone into, and he asked the Court, therefore, to send the case back to the referee. Mr. Baron Pollock, in his judgment, said in this contract the architect had power to decide all points in dispute between the parties, who, however, gave him the go-by, and neither of them resorted to him. The case, therefore, was sent to the official referee, who entered into all the matters in dispute and heard evidence, only taking the architect's estimates as to prices and values. There appeared to be no ground for disturbing or sending back the report, and the application must be refused with costs. Mr. Justice Grantham agreed. Leave to appeal was asked, but refused, Mr. Baron Pollock saying that it was for the benefit of both parties that there should be no further litigation.

Kensington Court Buildings Once More.—The Height of Corner Buildings.—The case remitted from the High Court of Justice to the Magistrate, to impose penalties for erecting a building at the corner of Kensington-court beyond the proper height came on for decision at West London Police Court, on Saturday. The proceedings were instituted by the London County Council, and had been twice referred to the High Court, owing to an adverse decision given by the magistrate. In the first place, the County Council proceeded against the builders, but the magistrate dismissed the summons, mainly on the ground that the house was in the Kensington High-road, and that it was a hardship that it should have to be reduced in height because other persons thought proper to put up buildings adjoining. There was an appeal to the Queen's Bench Division, and the magistrate was directed to convict.—The County Council then endeavoured to recover continuing penalties of 40s. a day, but they could not, as the builders had finished the work and left the premises. Proceedings were next taken against Mr. Worley, the owner. Another question then arose, that the council could not recover continuing penalties from the owner, as he had not been previously summoned for, or convicted of, the original offence, and further, that he could not be convicted of the original offence, because proceedings were not taken against him within six months of the commission or the discovery of such offence. It was argued before the magistrate, who decided in favour of the owner, and then came before the judges, who remitted the case back to him to impose penalties. The magistrate was now asked by Mr. Avory, on behalf of the London County Council, to impose substantial penalties for each of 67 days—namely, from the 31st of December, 1893, to the 7th March—in order that it might not be worth the owner's while to continue the present height of the building. Mr. Dickens, Q.C., for the owner, Mr. Worley, complained severely of the action of the County Council in the matter, and pointed out that if Kensington-court had been only a few feet wider the building could have been raised to 90ft., whereas it was only 70ft. in height. As no one had been injured, and there were not any complaints, he could not understand why the Council pressed for penalties, seeing that it was the first case of the kind under the Act. Mr. Curtis Bennett, in giving his decision, called attention to the London Building Act, 1894, which he said really dealt with the question raised in the case. The judges had agreed that it was a hard law, and Parliament had apparently come to the same conclusion, for in the new Act it was provided that where the building was on a corner site and abutted on two streets, the height should be regulated by the wider of the streets. That made the law clear, and removed the hardship. He thought, under the circumstances, that a penalty of 3s. a day would be adequate. It was a case in which some arrangement might be come to between the owner and the County Council. The defendant was then ordered to pay £10 1s., with five guineas costs.

CHIPS.

Three illuminated clock-dials, each 7ft. in diameter, have been put into the faces of the tower of St. Luke's Church, Heywood, in accordance with a bequest. Messrs. J. B. Joyce and Co., of Whitchurch, Salop, carried out the work.

A new Baptist chapel is about to be erected in Stanwell-road, Penarth, near Cardiff, and closely adjoining the existing Sunday schools. The new buildings will be erected from designs prepared by Messrs. J. P. Jones, Richards, and Budgen, architects, Cardiff, and the contract will be let towards the end of the coming January.

A lock with a total lift of 140ft. is proposed as a substitute for the flight of sixteen locks on the Erie Canal between West Troy and Cohoes. At present two to three hours are required for the passage of those locks, the delay being especially great because the locks are all single length. Thus far, says the *Engineering News*, forty out of the remaining seventy-two locks on the Erie Canal have been enlarged to double length; but to carry out this improvement on the flight of sixteen would be very difficult on account of lack of space, increased demand for water, and the great expense involved. The proposed high-lift lock would consist of two steel tanks, each large enough to contain a boat and its consort, or equal in capacity to the largest locks now in use on the canal. The two would balance each other, one ascending as the other descends, so that the only power required would be that necessary to overcome the friction of the machinery.

Our Office Table.

The London County Council, in their General Powers Bill for next session, seek powers to widen Blackstock-road, Islington, on the east side, at an estimated cost of £12,000, and to widen the Approach-road to Woolwich Ferry, at an estimated cost of £3,000. Power is also sought to widen Ben Jonson-road, Mile End, on the north side, at a cost of £3,070, and to acquire certain properties at Westminster for the purpose of giving access to the site of the old Millbank Prison, upon which site dwellings for the working classes are to be erected. The Council ask also to be empowered to acquire for fire brigade purposes certain land in Drummond-street, St. Pancras, and Florence-street, Islington.

The Bill deposited by the London County Council seeking powers to rebuild Vauxhall Bridge upon the site of the existing bridge provides that the new bridge shall be constructed with five openings. The Bill proposes that a temporary bridge shall be built for use during the construction of the new permanent bridge, immediately opposite the buildings of the new British Gallery, now in course of erection. The temporary bridge will consist of 11 openings, including a centre span of 70ft., and it is intended to leave it standing till after the proposed reconstruction of the Lambeth Suspension Bridge, for which purpose a Bill will be promoted in a future session. The Vauxhall bridge will be completed in seven years from the passing of the Act, and the Council ask for power to expend upon it £484,000 out of the capital account.

A third Bill deposited by the London County Council, for remodelling the whole system of the valuation and assessment of rateable property in London, proposes to repeal the London Assessment Acts of 1862, 1864, 1869, and 1884, and to re-enact some of the provisions of these Acts in an amended and codified form. The 126 clauses which are contained in the Bill comprise within them the whole of the clauses of the Valuation (Metropolis) Bill, which was introduced into Parliament last session as a Public Bill. The principal change proposed by the Bill is the establishment of a "London County Valuation Court," which is to consist of three members, one of whom shall be a barrister or solicitor of not less than 10 years' standing, one a member of the Surveyors' Institution of not less than 10 years' standing, and one shall be a person, "not being a barrister, solicitor, or surveyor," who shall have some experience in the assessment of property. The members of this Court are to receive such a salary as the Local Government Board may decide, and to be entitled to a Civil Service superannuation allowance. The duties of this Court would be to decide all questions of valuation, whether in the nature of appeals by the Council against the valuation list of any assessment committee, or appeals by ratepayers against their assessments.

Mr. Harry Hems and his sons entertained three score and ten broken down tradesmen in their "Luckie Horseshoe" Studios at Exeter on Christmas day. It was the 26th annual occasion, during which Mr. Hems has acted the host to no less than 2,062 of the "faithful city's" indigent, though worthy, old citizens, all now passed away save those present on Tuesday. The dinner, consisting of joints, geese, plum-pudding, and plenty of Burton beer, took two hours to consume. Afterwards every one was armed with a "yard of clay" in the shape of a genuine church-warden pipe, and the family punchbowls were filled and refilled until tea time. During the afternoon the Lord Bishop of Exeter, the Worshipful the Mayor, the Sheriffs (in their robes of office), Under-Sheriff, and Chief Constable visited the happy gathering, and the health of Mr. Harry Hems and family, proposed by the Mayor, was drunk enthusiastically. After tea there was a magic lantern, ancient songs, and old country dancing. The musical and vocal abilities of Messrs. Greville, C., and H. Turner Hems, and Mrs. G. Packham (*née* Hems), and the Misses Lottie and Mabel Hems, added greatly to the enjoyment of the day. The silken Exeter Civic Flag, which Mr. Hems personally rescued at the World's Fair, Chicago, last year, formed a conspicuous feature in the decorations of the studio, that did duty *pro tem.* as a banqueting hall. On leaving, just before midnight, each guest was presented with a shilling, a pound of plum pudding, and a quarter of a pound of tea, and, thus laden, went on his way rejoicing.
